ENTRIES ON ALL ASPECTS OF MEDICINE

# Oxford

CONCISE COLOUR

# Medical

# DICTIONARY

## **How to search for terms in the *Concise Colour Medical Dictionary***

To find an entry in this e-book you can:

- Browse the [Alphabetical List of Entries](#) and select the entry you would like to view

or

- Use your Search function to be taken to a complete list of references to your search term in the *Dictionary*
  - If your search term has its own entry, it will usually be listed at the top of your results
  - In cases where your search term appears in more than one entry heading, the results will be listed alphabetically

### **A note on special characters**

While most e-readers can display special characters (such as é and â), many cannot search for words containing them, unless the special characters themselves are typed into the search box. If you are unable to type these characters, please browse for your term using the [Alphabetical List of Entries](#).

## Appendices

- 1 SI units
  - Base and supplementary SI units
  - Derived SI units with special names
  - Decimal multiples and submultiples to be used with SI units
  - Conversion of units to and from SI units
- 2 Biochemical reference values for blood
  - Everyday tests
  - Blood gases
  - Diagnostic enzymes
  - Hormones
  - Proteins and immunoproteins
  - Lipids and lipoproteins
  - Vitamins
  - Tumour markers
- 3 Biochemical reference values for urine

- 4 Biochemical reference values for faeces
- 5 Biochemical reference values for cerebrospinal fluid
- 6 Haematological reference values
- 7 Paediatric reference values
- 8 Medical certificates
- 9 Doctors' training grades
- 10 Inherited medical conditions
- 11 Units of alcohol
- 12 Street names for illicit drugs
- 13 Online medical resources
- 14 Abbreviations and symbols

## Preface

The seventh edition of this dictionary provides full coverage of all the important terms and concepts used in medicine today. Written by a distinguished team of practising specialists and medical writers, it is intended primarily for workers in the paramedical fields: pharmacists, physiotherapists, speech therapists, social workers, hospital secretaries, administrators, technicians, and so on. It will also be invaluable for medical students and provides a useful reference for practising doctors. Each entry contains a basic definition, followed – where appropriate – by a more detailed explanation or description. A feature of the dictionary is that the articles are written in clear and concise English without the use of unnecessary medical jargon. For this reason the book will also be of both interest and value to the general reader who needs a home medical dictionary.

The dictionary defines terms in anatomy, physiology, biochemistry, and genetics, as well as in all the major medical and surgical specialties. Entries for medicinal drugs are given under their recommended International Non-proprietary Names (rINNs); where these differ from the names commonly used in Britain, the latter are included both as synonyms for the rINNs and as cross-reference entries (see below). Coverage of psychology and psychiatry, public health medicine, endocrinology, and dentistry is unusually comprehensive, and this edition includes some 250 new entries covering the latest developments in cardiology, radiology, and medical genetics, as well as the other medical and surgical specialties. Coverage of medical ethics has been considerably increased, and the public health entries have been extensively revised to take account of the latest changes in the NHS. Another feature of the book is the Appendices, which include (among others) units of alcohol, lists of inherited medical conditions, and doctors' training grades (updated in light of the new IMT programme); the Abbreviations and Online medical resources sections of the Appendices have also been thoroughly updated for this edition.

To avoid cluttering the entry list with derivative words (e.g. adjectival forms of nouns that are defined), these words are listed at the end of the definitions of the words from which they are derived. Where necessary, articles are supplemented by clear and fully labelled line drawings. An asterisk against a word used in a definition indicates that this term has its own entry in the dictionary and that additional information can be found there. Cross-reference entries simply refer the reader to another entry, indicating either that they are synonyms or abbreviations or that they – together with related terms – are most conveniently explained in one of the dictionary's longer articles. Synonyms and abbreviations are shown in brackets after the defined term.

## Drugs

5HT1 agonist  
abatacept  
abiraterone acetate  
abortifacient  
acamprosate calcium  
acaricide  
ACE inhibitor  
acebutolol  
acetazolamide  
acetylcholine  
acetylcholinesterase inhibitor  
acetylcysteine  
aciclovir  
adalimumab  
adefovir dipivoxil  
adenosine  
ADH  
adjunct  
adrenolytic

aflibercept  
agonist  
albendazole  
alclometazone  
alendronic acid  
alfacalcidol  
alfentanil  
alfuzosin  
alginates  
algoliptin  
alimemazine  
alkylating agents  
allopurinol  
alpha blocker  
alpha-glucosidase inhibitor  
alprazolam  
alprostadiol  
alteplase  
aluminium chloride hexahydrate  
aluminium hydroxide  
alverine citrate  
amantadine  
amiloride  
aminoglycosides  
aminophylline  
aminosalicylates  
amiodarone  
amitriptyline  
amlodipine  
amobarbital  
amorolfine  
amoxicillin  
amphetamines  
amphotericin

ampicillin  
anabolic  
anaesthetic  
anakinra  
analeptic  
analgesic  
analogue  
angiogenesis inhibitor  
angiotensin II antagonist  
anhidrotic  
anodyne  
antacid  
antagonist  
antazoline  
anthelmintic  
anthracycline  
anti-androgen  
anti-arrhythmic  
antibacterial  
antibiotic  
anticholinesterase  
anticoagulant  
anticonvulsant  
anti-D immunoglobulin  
antidepressant  
antidiabetic drugs  
antidote  
antiemetic  
antifibrinolytic  
antifungal  
antihistamine  
antihypertensive drugs  
anti-inflammatory  
antiketogenic

antimetabolite  
antimitotic  
antimuscarinic  
antimutagen  
anti-oestrogen  
antioxidant  
antiplatelet drug  
antipruritic  
antipsychotic  
antipyretic  
antiretroviral drug  
antisecretory drug  
antiseptic  
antispasmodic  
antispastic  
antitussive  
antiviral drug  
anxiolytic  
aperient  
aphrodisiac  
apomorphine  
apraclonidine  
aprepitant  
aromatase inhibitor  
artemisinin  
asparaginase  
aspirin  
astringent  
atenolol  
atomoxetine  
atorvastatin  
atracurium besilate  
atropine  
azathioprine

azelaic acid  
azelastine  
azithromycin  
aztreonam  
bacitracin zinc  
baclofen  
bactericidal  
bacteriostatic  
barbiturate  
barium sulphate  
barrier cream  
beclometasone  
belladonna  
bendroflumethiazide  
benperidol  
benzalkonium  
benzodiazepines  
benzoic acid  
benzoyl peroxide  
benzydamine hydrochloride  
benzyl benzoate  
beta blocker  
betahistine  
beta-lactam antibiotic  
betamethasone  
betaxolol  
bevacizumab  
bezafibrate  
bicalutamide  
biguanide  
bile-acid sequestrant  
bimatoprost  
bisacodyl  
bisoprolol

bisphosphonates  
bleomycin  
boceprevir  
borneol  
bortezomib  
botulinum toxin  
brentuximab vedotin  
brimonidine  
brinzolamide  
bromocriptine  
Brompton cocktail  
bronchoconstrictor  
bronchodilator  
buclicine  
budesonide  
bumetanide  
bupivacaine  
buprenorphine  
bupropion  
buserelin  
buspirone  
busulfan  
butobarbital  
butyrophenone  
cabergoline  
caffeine  
calamine  
calcipotriol  
calcitonin  
calcitriol  
calcium-channel blocker  
camphor  
cannabis  
capecitabine

capreomycin  
captopril  
carbamazepine  
carbimazole  
carbonic anhydrase inhibitor  
carboplatin  
carboprost  
carminative  
carmustine  
carteolol  
caustic  
cefaclor  
cefadroxil  
cefalexin  
ceftazidime  
cefuroxime  
celecoxib  
cephalosporin  
cetrimide  
cetuximab  
chloral hydrate  
chlorambucil  
chloramphenicol  
chlordiazepoxide

# A

**a- (an-)** *prefix denoting absence of; lacking; not.* Examples: **amastia** (absence of breasts); **amorphic** (lacking definite form); **atoxic** (not poisonous).

**A & E medicine** accident and emergency medicine: an important specialty dealing with the immediate problems of the acutely ill and injured. *See also* **ED**.

**AA** *see* **ALCOHOLICS ANONYMOUS**.

**ab-** *prefix denoting away from.* Example: **abembryonic** (away from or opposite the embryo).

**abarticulation** *n.* **1.** the dislocation of a joint. **2.** a synovial joint (*see* **DIARTHROSIS**).

**abasia** *n.* an inability to walk normally for which no physical cause can be identified. The patient displays normal motor ability when sitting or lying down, suggesting that a psychogenic reaction may be involved (*see* **CONVERSION DISORDER**). **Astasia-abasia** (also known as **Blocq's disease**) is abasia with the inability to stand.

**abatacept** *n.* a **\*biological therapy** that inhibits overactive T-lymphocyte stimulation of the immune response. It is used for the management of moderate to severe rheumatoid arthritis to treat joint pain and swelling, improve quality of life, and prevent joint damage. Side-effects are rare but may include infection, allergy, and headache.

**abbreviated injury scale** a quick method for determining the severity of a case of serious trauma. It can be used for purposes of **\*triage** and **\*clinical audit**.

**abciximab** *n.* an **\*antiplatelet drug** (a **\*monoclonal antibody**) that is used as an adjunct to lessen the chance of a heart attack during surgery to open blocked arteries of the heart (*see* **CORONARY ANGIOPLASTY**). Side-effects include bleeding, nausea, chest and back pain, and headache.

**abdomen** *n.* the part of the body cavity below the chest (*see* **THORAX**), from which it is separated by the **\*diaphragm**. The abdomen contains the organs of digestion – stomach, liver, intestines, etc. – and excretion – kidneys, bladder, etc.; in women it also contains the ovaries and uterus. The regions and quadrants of the abdomen are shown in the illustration: the four quadrants, demarcated by broken lines, are the right upper (RUQ), right lower (RLQ), left upper (LUQ), and left lower (LLQ). Terms to designate the regions are those used in day-to-day medical practice rather than in anatomy textbooks. —**abdominal** *adj.*

**Regions and quadrants of the abdomen.**

**abdomin-** (**abdomino-**) *combining form denoting the abdomen.* Examples: **abdominalgia** (pain in the abdomen); **abdominothoracic** (relating to the abdomen and thorax).

**abdominal dehiscence** *see* **BURST ABDOMEN**.

**abdominal migraine** a condition characterized by intermittent central abdominal pain that may be associated with nausea, and often vomiting. It

usually occurs in children between the ages of three and ten years and is more common in those with a family history of migraine headaches. Typically these children develop migraine headaches when they are older.

**abdominal thrusts (Heimlich manoeuvre)** a manoeuvre for the treatment of choking in which the patient is held firmly around the midriff just under the ribcage. The hands of the rescuer are held as a fist and short sharp thrusts into the patient's upper abdomen are made in order to dislodge the obstructing article from the airway. This manoeuvre should not be performed on children under the age of one year.

**abdominoperineal resection** surgical excision of the anal sphincter, rectum, and part of the sigmoid colon because of cancer involving the anal canal or the lower third of the rectum. The remaining length of sigmoid colon is brought through the abdominal wall (*see* **COLOSTOMY**; **STOMA**). This procedure may be performed using abdominal and perineal incisions or laparoscopically; it is indicated for tumours close to the anal canal and in patients with poor sphincter function.

**abducens nerve** the sixth **\*cranial nerve** (VI), which supplies the lateral rectus muscle of each eyeball, responsible for turning the eye outwards.

**abduct** *vb.* to move a limb or any other part away from the midline of the body. —**abduction** *n.*

**abductor** *n.* any muscle that moves one part of the body away from another or from the midline of the body.

**aberrant** *adj.* abnormal: usually applied to a blood vessel or nerve that does not follow its normal course.

**aberration** *n.* (in optics) a defect in the image formed by an optical device (e.g. a lens). In **chromatic aberration** the image has coloured fringes as a result of the different extent to which light of different colours is refracted. In **spherical aberration**, the image is blurred because rays from the object come to a focus in slightly different positions: the rays passing through more peripherally are bent more than those passing through centrally. This occurs even with monochromatic light.

**abfraction** *n.* a form of non-carious tooth-tissue loss manifesting as notching at the neck of a tooth. It is thought that this is caused by the forces placed on the teeth during biting, chewing, and grinding, resulting in flexion and the separation of the enamel from the dentine at the **\*cemento-enamel junction**.

**abiotrophy** *n.* degeneration or loss of function without apparent cause; for example, **retinal abiotrophy** is progressive degeneration of the retina leading to impaired vision, occurring in genetic disorders such as **\*retinitis pigmentosa**.

**abiraterone acetate** a drug used in the treatment of metastatic prostate cancer resistant to hormonal treatment. It reduces testosterone production in prostate and adrenal tissues by inhibiting an enzyme, cytochrome P450 17A1, involved in the androgen-producing pathway in these tissues (*see* **ANTI-ANDROGEN**). Side-effects include oedema, liver disorders, hypertension, and low potassium levels.

**ablation** *n.* **1.** a technique in which tumours or other abnormal areas are destroyed using thermal energy, whether by heating or freezing (*see* **CRYOABLATION**). It is commonly used with liver tumours, kidney tumours, lung tumours, and abnormalities of the heart conduction system. Large thyroid goitres are also now ablated to reduce their size, with very good cosmetic results. In **\*radiofrequency ablation** (RFA) radiofrequency waves are passed through a needle placed in the target area, which agitates the atoms and produces heat at the active tip. **2.** more generally, the removal or destruction of tissue or an abnormal growth by surgery, hormones, drugs, etc. For example, **hormonal therapy** is an alternative to surgery for the treatment of breast cancer when the patient is not fit for resectional surgery. In dentistry hard tissue can be removed by **erbium laser ablation**, with or without water spray. *See also* **ENDOMETRIAL ABLATION**; **RADIOIODINE ABLATION**.

**ablepharia** *n.* absence of or reduction in the size of the eyelids.

**ABO system** *see* **BLOOD GROUP**.

**abortifacient** *n.* a drug that induces abortion or miscarriage. *See* **MIFEPRISTONE**; **PROSTAGLANDIN**.

**abortion** *n.* **1. (induced abortion, termination of pregnancy)** the removal of an embryo or fetus from the uterus at a stage of pregnancy when it is deemed incapable of independent survival (i.e. at any time between conception and the 24th week of pregnancy). One of the most commonly performed gynaecological procedures in the UK, it must be carried out within the terms of the Abortion Act 1967, as amended by the Human Fertilisation and Embryology Act 1990. Two doctors must agree that termination of pregnancy is necessary, either (a) under 24 weeks, if continuing the pregnancy poses a greater risk to the physical or mental health of the woman or her existing children, or (b) over 24 weeks, if the woman's life or health is seriously in danger or if there is a substantial risk of severe disability in the child if born. The woman must be provided with full information about the methods of termination available so that she can give **\*informed consent**. Over 90% of terminations in the UK are performed under 24 weeks, and most of these under 12 weeks. Early medical termination (using drugs, e.g. **\*mifepristone**, **\*misoprostol**) carries less risk to the woman than later surgical termination (e.g. **\*vacuum aspiration**, **\*dilatation and curettage**). The 1967 Act was never applied to Northern Ireland, where the law remained far more restrictive; measures to decriminalize abortion in the province took effect in October 2019. **2. (spontaneous abortion)** *see* **MISCARRIAGE**.

**abortus** *n.* a fetus, weighing less than 500 g, that is expelled from the uterus either dead or incapable of surviving.

**Abrams–Griffiths number (bladder outlet obstruction index, BOOI)** a mathematical index used to estimate the degree of bladder outlet obstruction (**\*BOO**). It categorizes patients as being obstructed, unobstructed, or equivocal.

**abrasion** *n.* **1.** a graze: a minor wound in which the surface of the skin or a mucous membrane is worn away by rubbing or scraping. **2.** the non-carious loss of hard tooth substances caused by external mechanical factors (i.e. not by chewing or tooth-to-tooth contact). It is commonly associated with an aggressive toothbrushing technique and is enhanced by **\*erosion**. **3.** any rubbing or scraping action that produces surface wear.

**abreaction** *n.* the therapeutic release of strong emotion commonly associated with a buried memory. The therapist may help the patient to retrieve the memory (sometimes through hypnosis), which is accompanied by the release

and discharge of tension and anxiety associated with it; this is supposed to rid the memory of its power. This intervention is now largely obsolete in psychological practice. *See* [REPRESSION](#).

**abruptio (ablatio)** *n.* separation.

**abruptio placentae (placental abruption)** bleeding from a normally situated placenta causing its complete or partial detachment from the uterine wall after the 24th week of gestation. Abruptio is often an unanticipated emergency, as a small bleed ([\\*antepartum haemorrhage](#)) can suddenly evolve into a major abruption and [\\*disseminated intravascular coagulation](#). Abruptio placentae is often associated with hypertension and pre-eclampsia.

**abscess** *n.* a localized collection of pus and necrotic tissue anywhere in the body, surrounded and walled off by damaged and inflamed tissues. A [\\*boil](#) is an example of an abscess within the skin. The usual cause is local bacterial infection, often by staphylococci, that the body's defences have failed to overcome. In a **cold abscess**, due to tubercle bacilli, there is swelling, but little pain or inflammation (as in acute abscesses). Antibiotics, aided by surgical incision to release pus where necessary, are the usual forms of treatment.

The brain and its meninges have a low resistance to infection and a **cerebral abscess** is liable to follow any penetration of these by microorganisms. The condition is fatal unless relieved by aspiration or surgical drainage.

**absence** *n.* (in neurology) *see* [EPILEPSY](#).

**Absidia** *n.* a genus of fungi that sometimes cause disease in humans (*see* [PHYCOMYCOSIS](#)).

**absorption** *n.* (in physiology) the uptake of fluids or other substances by the tissues of the body. Digested food is absorbed into the blood and lymph from the alimentary canal. Most absorption of food occurs in the small intestine – in the jejunum and ileum – although alcohol is readily absorbed from the stomach. The small intestine is lined with minute finger-like processes (*see* [VILLUS](#)), which greatly increase its surface area and therefore the speed at which absorption can take place. *See also* [ASSIMILATION](#); [DIGESTION](#).

**abulia** *n.* a lack of will and initiative resulting in the inability to act or make decisions independently. It occurs in neurological diseases involving the frontal lobes and/or **\*basal ganglia**, such as **\*traumatic brain injury**, stroke, and dementia. Abulia is also seen in psychiatric diseases, including schizophrenia. It is a disorder of motivation and may result from dysfunction of the **\*dopamine**-mediated reward system.

**abutment** *n.* (in dentistry) the supporting component of a dental **\*bridge** or **\*implant**.

**ACA** *see* **AFFORDABLE CARE ACT 2010**.

**academic health science network (AHSN, academic health science centre, academic health science system, academic medical partnership)** a regional partnership between one or more academic institutions (typically universities) and one or more health-care providers (in England, typically foundation trusts) with a twin focus on promoting economic growth in the region covered and improving the health of the population. Many AHSNs also include third-sector and industry partners and most have a role in providing education and training. The fifteen AHSNs across England were established by NHS England in 2013 and represent a national expansion of the earlier **Academic Health Science Partnerships (AHSPs)**, which were first set up in London in 2007.

**acalculia** *n.* an acquired inability to make simple mathematical calculations. It is a symptom of disease in the dominant **\*parietal lobe** of the brain. *See* **GERSTMANN'S SYNDROME**.

**acamprosate calcium** a drug used, in conjunction with counselling, for the maintenance of sobriety. Patients must already be abstinent at the beginning of treatment. The most common side-effect is diarrhoea.

**acantha** *n.* **1.** a spine projecting from a **\*vertebra**. **2.** the **\*backbone**.

**Acanthamoeba** *n.* a genus of amoebae commonly found in dust, soil, and fresh water. Several species can cause serious infection of the cornea, usually resulting from the use of improperly sterilized contact lenses (which may have been cleaned with tap water, for example).

**acanthion** *n.* the tip of the spine formed where projecting processes of the upper jaw bones (maxillae) meet at the front of the face.

**acanthocyte** *n.* a red blood cell (erythrocyte) with abnormal projections of the cell membrane giving the cell a thorny appearance.

**acanthosis** *n.* an increase in the number of **\*prickle cells** in the innermost layer of the epidermis, leading to thickening of the epidermis. **Acanthosis nigricans** is characterized by papillomatous growths, mainly in the armpits, neck, and groin, giving the skin a pigmented appearance and a velvety thickened texture. It may be associated with internal malignancy. **Pseudoacanthosis nigricans** is more common and is associated with obesity and **\*insulin resistance**.

**acapnia (hypocapnia)** *n.* a condition in which there is an abnormally low concentration of carbon dioxide in the blood. This may be caused by breathing that is exceptionally deep in relation to the physical activity of the individual.

**acarbose** *n.* see **ALPHA-GLUCOSIDASE INHIBITOR**.

**acardia** *n.* congenital absence of the heart. The condition may occur in conjoined twins; the twin with the heart controls the circulation for both.

**acariasis** *n.* an infestation of mites and ticks and the symptoms, for example allergy and dermatitis, that their presence may provoke.

**acaricide** *n.* any chemical agent used for destroying mites and ticks.

**acarid** *n.* a **\*mite** or **\*tick**.

**Acarina** *n.* the group of arthropods that includes the **\*mites** and **\*ticks**.

**Acarus (Tyroglyphus)** *n.* a genus of mites. The flour mite, *A. siro* (*T. farinae*), is nonparasitic, but its presence in flour can cause a severe allergic dermatitis in flour-mill workers.

**acatalasia** *n.* a rare inborn lack of the enzyme **\*catalase**, leading to recurrent infections of the gums (gingivitis) and mouth. There are two variants: Japanese (**Takahara disease**) and Swiss (asymptomatic).

**acceptor** *n.* (in biochemistry) a substance that helps to bring about oxidation of a reduced **\*substrate** by accepting hydrogen ions.

**accessory muscles** muscles of the shoulder girdle and chest wall that (in addition to the intercostal muscles and the diaphragm) are utilized during **\*respiratory distress** to help the flow of air in and out of the lungs. Use of these muscles can be a sign of the degree of difficulty that the patient is in, for example in cases of asthma or **\*airway obstruction**.

**accessory nerve (spinal accessory nerve)** the eleventh **\*cranial nerve** (XI), which arises from two roots, cranial and spinal. Fibres from the cranial root travel with the nerve for only a short distance before branching to join the vagus and then forming the recurrent laryngeal nerve, which supplies the internal laryngeal muscles. Fibres from the spinal root supply the sternomastoid and trapezius muscles, in the neck region (front and back).

**accessory pathway** an extra electrical conduction pathway between the atria and ventricles, anatomically separate from the **\*atrioventricular node**, that predisposes to **\*re-entry tachycardia**. The pathway conducts faster than the atrioventricular node, giving rise to pre-excitation recognized by a characteristic delta wave at the beginning of the QRS complex on the electrocardiogram in normal rhythm. The presence of this pathway, with the occurrence of intermittent tachycardias, is known as the **\*Wolff-Parkinson-White syndrome**.

**accident** *n.* a traumatic incident involving any part of the body. **Accident & emergency (A & E) medicine** is a specialized area of patient care dealing with acute illness.

**accommodation** *n.* adjustment of the shape of the lens to change the focus of the eye. When the ciliary muscle (*see* **CILIARY BODY**) is relaxed, suspensory ligaments attached to the ciliary body and holding the lens in position are stretched, which causes the lens to be flattened. The eye is then able to focus on distant objects. To focus the eye on near objects the ciliary muscles contract and the tension in the ligaments is thus lowered, allowing the lens to become rounder. Adjustments in **\*convergence** also contribute to accommodation.

**accommodation reflex (convergence reflex)** a reflex that occurs when an individual focuses on a near object, in which the crystalline lens becomes more convex, the pupils constrict, and the eyes turn inwards.

**accommodative insufficiency** a weakness of accommodation as a part of the ageing process or as a result of injury, disease, or the effect of medication.

**accouchement** *n.* delivery of a baby.

**acebutolol** *n.* a **\*beta blocker** drug used to treat high blood pressure, angina pectoris, and irregular heart rhythms. Possible side-effects include breathing difficulty, especially in asthmatics, and cold hands and feet.

**ACE inhibitor** angiotensin-converting enzyme inhibitor: any one of a group of drugs used in the treatment of raised blood pressure and heart failure. ACE inhibitors act by interfering with the action of the enzyme that converts the inactive **\*angiotensin** I to the powerful artery constrictor angiotensin II. The absence of this substance allows arteries to widen and the blood pressure to drop. Possible side-effects include weakness, dizziness, loss of appetite, and skin rashes.

**acentric** *n.* (in genetics) a chromosome or fragment of a chromosome that has no **\*centromere**. Since acentrics cannot attach to the **\*spindle** they are usually lost during cell division. They are often found in cells damaged by radiation.  
—**acentric** *adj.*

**acephalus** *n.* a fetus without a head.

**acervulus cerebri** a collection of granules of calcium-containing material that is sometimes found within the **\*pineal gland** as its calcification proceeds (normally after the 17th year): ‘brain sand’.

**acesulfame potassium** an artificial sweetener (E950) 200 times sweeter than sugar. It is often used in combination with other sweeteners to produce a superior flavour. Not metabolized by the body, it is suitable for use in diabetic foods and can be used in cooking.

**acetabulum (cotyloid cavity)** *n.* either of the two deep sockets, one on each side of the **\*hip bone**, into which the head of the thigh bone (femur) fits at the **\*hip joint**.

**acetaminophen** *n.* *see* PARACETAMOL.

**acetazolamide** *n.* a **\*carbonic anhydrase inhibitor** used mainly in the treatment of glaucoma to reduce the pressure inside the eyeball and also as a preventative for epileptic seizures and altitude sickness. Side-effects include drowsiness and numbness and tingling of the hands and feet.

**acetoacetic acid** an organic acid produced in large amounts by the liver under metabolic conditions associated with a high rate of fatty acid oxidation (for example, in starvation). The acetoacetic acid thus formed is subsequently converted to acetone and excreted. *See also* KETONE.

**acetone** *n.* an organic compound that is an intermediate in many bacterial fermentations and is produced by fatty acid oxidation. In certain abnormal conditions (for example, starvation) acetone and other **\*ketones** may accumulate in the blood (*see* KETOSIS). Acetone is a volatile liquid that is miscible with both fats and water and therefore of great value as a solvent. It is used in chromatography and in the preparation of tissues for enzyme extraction.

**acetone body (ketone body)** *see* KETONE.

**acetonuria** *n.* *see* KETONURIA.

**acetylcholine** *n.* the acetic acid ester of the organic base choline: the **\*neurotransmitter** released at the synapses of parasympathetic nerves and at **\*neuromuscular junctions**. After relaying a nerve impulse, acetylcholine is rapidly broken down by the enzyme **\*cholinesterase**. **\*Antimuscarinic** drugs block the action of acetylcholine at receptor sites; **\*anticholinesterases** and **\*acetylcholinesterase inhibitors** prolong the activity of acetylcholine by blocking cholinesterase.

A pharmaceutical preparation of acetylcholine is instilled into the anterior chamber of the eye as a **\*miotic** during intraocular surgery.

**acetylcholinesterase** *n.* *see* CHOLINESTERASE.

**acetylcholinesterase inhibitor** any one of a class of drugs that block the action of acetylcholinesterase (*see* CHOLINESTERASE), an enzyme that quickly breaks down the neurotransmitter acetylcholine. This

neurotransmitter is central to the functional interconnection between nerve cells in the outer layer (cortex) of the brain; the early impairment of cognitive function found in Alzheimer's disease is associated with a reduction in acetylcholine levels. By inhibiting acetylcholine breakdown, acetylcholinesterase inhibitors have been found helpful in slowing down the rate of cognitive decline in mild to moderate dementia; they do not halt the progress of the disease. The group includes **donepezil**, **galantamine**, and **rivastigmine**

**acetylcysteine** *n.* a drug administered to break down mucus filaments in the eyes in the treatment of dry eyes (for example, in *\*Sjögren's syndrome*). It is also given to prevent liver damage in paracetamol overdose. Acetylcysteine has been shown to have efficacy in treating idiopathic pulmonary fibrosis, but it is not licensed for this purpose.

**acetylsalicylic acid** *see* **ASPIRIN**.

**achalasia** a disorder of the oesophagus (gullet) characterized by uncoordinated or absent contraction of oesophageal smooth muscle and incomplete relaxation of the lower oesophageal sphincter (LOS), leading to disturbances of swallowing (*see* **DYSPHAGIA**). It may occur at any age and affects both sexes equally: symptoms include progressive difficulty in swallowing liquids and solids, food regurgitation, and chest pain precipitated by oesophageal spasm. Diagnosis is by *\*barium swallow* X-ray examination, endoscopy, and oesophageal *\*manometry*. Treatment is by endoscopic balloon dilatation of the LOS, surgical division of the muscle fibres of the LOS (**Heller's cardiomyotomy**), or by injection of *\*botulinum toxin* into the LOS.

**Achilles tendon** the tendon of the muscles of the calf of the leg (the *\*gastrocnemius* and soleus muscles), situated at the back of the ankle and attached to the calcaneus (heel bone).

**achlorhydria** *n.* absence of hydrochloric acid in the stomach. Achlorhydria is associated with many conditions, including autoimmune diseases (such as pernicious anaemia), drug therapy (particularly proton pump inhibitors), *\*Helicobacter pylori* infection, and previous gastric surgery. It carries an increased risk of stomach cancer, bacterial overgrowth, and hip fractures.

**acholia** *n.* absence or deficiency of bile secretion or failure of the bile to enter the alimentary canal (for example, because of an obstructed bile duct).

**acholuria** *n.* absence of the **\*bile pigments** from the urine, which occurs in some forms of jaundice (**acholuric jaundice**). —**acholuric** *adj.*

**achondroplasia** *n.* a disorder, inherited as a **\*dominant** characteristic, in which the bones of the arms and legs fail to grow to normal size due to a defect in both cartilage and bone. It results in a type of **\*dwarfism** characterized by short limbs, a normal-sized head and body, and normal intelligence. —**achondroplastic** *adj.*

**achromatic** *adj.* without colour.

**achromatic lenses** lenses that are specially designed to give clear images, eliminating the coloured fringes that are produced with ordinary lenses (caused by splitting of the light into different wavelengths and hence its component colours). Such lenses are useful in scientific instruments, such as the eyepieces of microscopes.

**achromatopsia** *n.* the inability to differentiate different shades of colour. Such complete **\*colour blindness** is very rare and is usually associated with poor **\*visual acuity**, nystagmus, and sensitivity to bright light. It is usually determined by hereditary factors.

**aciclovir (acyclovir)** *n.* an antiviral drug that inhibits DNA synthesis in cells infected by **\*herpesviruses**. It is used in the treatment of herpes simplex, herpes zoster, herpetic eye disease, and herpes encephalitis and also in patients whose immune systems are compromised.

**acidaemia** *n.* abnormally high blood acidity. This condition may result from an increase in the concentration of acidic substances and/or a decrease in the level of alkaline substances in the blood. *See also* **ACIDOSIS**. *Compare* **ALKALAEMIA**.

**acid-base balance** the balance between the amount of carbonic acid and bicarbonate in the blood, which must be maintained at a constant ratio of 1:20 in order to keep the hydrogen ion concentration of the plasma at a constant value (pH 7.4). Any alteration in this ratio will disturb the acid-base balance of the blood and tissues and cause either **\*acidosis** or **\*alkalosis**.

The lungs and the kidneys play an important role in the regulation of the acid-base balance.

**acid-etch technique** a technique for creating a mechanical bond between resin-based materials and the enamel of teeth; it is used to retain and seal the margins of composite fillings, to retain brackets of fixed orthodontic appliances, and to retain resin-based **\*fissure sealants** and adhesive bridges. Phosphoric acid is used to create a porous surface into which a bonding agent can flow.

**acid-fast** *adj.* **1.** describing bacteria that have been stained and continue to hold the stain after treatment with an acidic solution. For example, tuberculosis bacteria are acid-fast when stained with a **\*carbol fuchsin** preparation. **2.** describing a stain that is not removed from a specimen by washing with an acidic solution.

**acidophil (acidophilic)** *adj.* **1.** (in histology) describing tissues, cells, or parts of cells that stain with acid dyes (such as eosin). *See also* **ADENOMA**. **2.** (in bacteriology) describing bacteria that grow well in acid media.

**acidosis** *n.* a condition in which the acidity of body fluids and tissues is abnormally high. This arises because of a failure of the mechanisms responsible for maintaining a balance between acids and alkalis in the blood (*see* **ACID-BASE BALANCE**). In **gaseous acidosis** more than the normal amount of carbon dioxide is retained in the body, as in drowning. Patients with diabetes mellitus suffer from **\*diabetic ketoacidosis**, in which sodium, potassium, and **\*ketone** bodies are lost in the urine. *See also* **LACTIC ACIDOSIS**; **RENAL TUBULAR ACIDOSIS**.

**acinus** *n.* (*pl.* **acini**) **1.** a small sac or cavity surrounded by the secretory cells of a gland. Some authorities regard the term as synonymous with **\*alveolus**, but others distinguish an acinus by the possession of a narrow passage (lumen) leading from the sac. **2.** (in the lung) the tissue supplied with air by one terminal **\*bronchiole**. **\*Emphysema** is classified by the part of the acinus involved (i.e. **centriacinar**, **panacinar**, or **periacinar**). —**acinous** *adj.*

**acitretin** *n.* *see* **RETINOID**.

**aclasia (aclasis)** *n.* *see* **EXOSTOSIS**.

**acne (acne vulgaris)** *n.* a common inflammatory disorder of the sebaceous glands. These grease-producing glands are under androgen control, but the cause of acne is unknown. It typically involves the face, back, and chest and is characterized by the presence of blackheads with papules, pustules, and – in more severe cases – cysts and scars. Acne is readily treatable. Mild cases respond to topical therapy with **\*benzoyl peroxide**, while more refractory conditions require treatment with long-term antibiotics or (for treating women only) the oral contraceptive pill; severe or cystic acne can be treated with oral **\*isotretinoin**. Exogenous or occupational factors, such as occlusion from tight or impermeable clothes, make-up, or chemicals, may trigger or exacerbate acne (*see* **CHLORACNE**).

**aconite** *n.* the dried roots of the herbaceous plant *Aconitum napellus* (monkshood or wolfbane), containing three **\*analgesic** substances: **aconine**, **aconitine**, and **picraconitine**. Aconite was formerly used to prepare liniments for muscular pains and a tincture for toothache, but is regarded as too toxic for use today.

**acoria** *n.* absence of the pupil.

**acoustic** *adj.* of or relating to sound or the sense of hearing.

**acoustic incident** a sudden unexpected noise, typically transmitted through a telephone handset or headset, with the potential of triggering **\*acoustic shock**.

**acoustic nerve** *see* **COCHLEAR NERVE**.

**acoustic neuroma** *see* **VESTIBULAR SCHWANNOMA**.

**acoustic shock** an adverse reaction to a sudden unexpected noise (an **\*acoustic incident**). The condition is characterized by symptoms that may include pain, dizziness, tinnitus, anxiety, and depression. It is not usually associated with permanent reduction of hearing, in comparison to noise-induced hearing loss (*see* **DEAFNESS**).

**ACPA** anticitrullinated protein antibodies: autoantibodies directed against citrullinated proteins, which are highly specific for rheumatoid arthritis and may be detected before any clinical manifestations of the disease.

**acquired** *adj.* describing a condition or disorder contracted after birth and not attributable to hereditary causes. *Compare* CONGENITAL.

**acquired immune deficiency syndrome** *see* AIDS.

**acrania** *n.* congenital absence of the skull, either partial or complete, due to a developmental defect.

**acro-** *combining form denoting* **1.** extremity; tip. Example: **acrohypothermy** (abnormal coldness of the extremities (hands and feet)). **2.** height; promontory. Example: **acrophobia** (morbid dread of heights). **3.** extreme; intense. Example: **acromania** (an extreme degree of mania).

**acrocentric** *n.* a chromosome in which the \*centromere is situated at or very near one end. —**acrocentric** *adj.*

**acrocephalosyndactyly** *n.* any one of a group of related inherited disorders, including \*Apert syndrome, resulting in abnormalities of the skull (\*craniosynostosis), face, and hands and feet (\*syndactyly).

**acrocyanosis** *n.* bluish-purple discoloration of the hands and feet due to slow circulation of the blood through the small vessels in the skin.

**acrodermatitis** *n.* inflammation of the skin of the feet or hands. A diffuse chronic variety produces swelling and reddening of the affected areas, followed by atrophy. It is a manifestation of \*Lyme disease. **Acrodermatitis enteropathica** is an inherited (autosomal \*recessive) inability to absorb sufficient \*zinc, which causes patchy sparse hair; patches of dry scaly eczematous skin on the hands, feet, scalp, and around the mouth and anogenital region; and chronic diarrhoea. Management consists of zinc supplements.

**acrodynia** *n.* *see* PINK DISEASE.

**acromegaly** *n.* a condition caused by excessive secretion of \*growth hormone, usually by a benign tumour of the anterior pituitary gland. Overgrowth of soft tissues and bones characteristically results in large spadelike hands and feet, prominent brow ridges, broadening of the bridge of the nose, \*prognathism, widely spaced teeth, enlargement of the tongue, and excessive skin tags. The condition can be associated with an increased risk

of cardiovascular disease and cancer of the large bowel. Treatment is by surgical removal of the tumour (adenomectomy) and/or radiotherapy, with or without hormone therapy.

**acromion** *n.* an oblong process at the top of the spine of the **\*scapula**, part of which articulates with the clavicle (collar bone) to form the **acromioclavicular joint**. —**acromial** *adj.*

**acropachy** *n.* *see* **THYROID ACROPACHY**.

**acroparaesthesia** *n.* a tingling sensation in the hands and feet. *See* **PARAESTHESIA**.

**acrosclerosis** *n.* a skin disease thought to be a type of generalized **\*scleroderma**. It also has features of **\*Raynaud's disease**, with the hands, face, and feet being mainly affected.

**acrosome** *n.* the caplike structure on the front end of a spermatozoon. It breaks down just before fertilization (the **acrosome reaction**), releasing a number of enzymes that assist penetration between the follicle cells that still surround the ovum. Failure of the acrosome reaction is a cause of male infertility (*see also* **ANDROLOGY**).

**acrylic resin** a thermoplastic or thermosetting polymeric material derived from acrylic acid, methacrylic acid, or other related compounds. Acrylic resins are used in dentistry for making denture teeth, denture bases, and orthodontic appliances owing to their good biocompatibility. They are also used in orthopaedic surgery, cosmetic surgery, and ophthalmology for the same reason.

**ACTH** (**adrenocorticotrophic hormone, adrenocorticotrophin, corticotrophin**) a hormone synthesized and stored in the anterior pituitary gland, large amounts of which are released in response to any form of stress. Its release is stimulated by **\*corticotrophin-releasing hormone**. ACTH controls the secretion of **\*corticosteroid** hormones from the adrenal gland. An analogue of ACTH, **tetracosactide**, is administered by injection to test adrenal function (*see* **SYNACTHEN TESTS**).

**actin** *n.* a protein, found in muscle, that plays an important role in the process of contraction. *See* **STRIATED MUSCLE**.

**Actinobacillus** *n.* a genus of Gram-negative nonmotile aerobic bacteria that are characteristically spherical or rodlike in shape but occasionally grow into branching filaments. Actinobacilli cause disease in animals that can be transmitted to humans.

**Actinomyces** *n.* a genus of Gram-positive nonmotile fungus-like bacteria that cause disease in animals and humans. The species *A. israelii* is the causative organism of human **\*actinomycosis**.

**actinomycin D** *see* DACTINOMYCIN.

**actinomycosis** *n.* an infectious bacterial disease that usually takes the form of painful abscesses in the jaw. It is caused by the genus *Actinomyces*, with *Actinomyces israelii* and *Actinomyces gerencseriae* being responsible for the majority of infections. The bacterium is normally present in the mouth but it may become pathogenic following a dental infection, radiation therapy, or trauma causing local tissue damage (including a dental extraction). It can also affect the lungs, breast, or gastrointestinal tract. Treatment is by surgical drainage of pus and a prolonged course of antibiotics. **\*Hyperbaric oxygenation** may also be used.

**actinotherapy** *n.* the treatment of disorders with **\*infrared** or **\*ultraviolet radiation**.

**action potential** the change in voltage that occurs across the membrane of a nerve or muscle cell when a **\*nerve impulse** is triggered. It is due to the passage of charged particles across the membrane (*see* DEPOLARIZATION) and is an observable manifestation of the passage of an impulse.

**active/passive** *adj.* the ethical distinction between actively doing something to a patient and simply allowing it to happen or failing to act (the **acts and omissions doctrine**). For instance, doctors should act to save life if possible, but when death is inevitable it is permissible to let it happen, although the prohibition against killing would not allow active intervention. *See also* DYING.

**active transport** (in biochemistry) an energy-dependent process in which certain substances (including ions, some drugs, and amino acids) are able to cross cell membranes against a concentration gradient. The process is

inhibited by substances that interfere with cellular metabolism (e.g. high doses of digitalis).

**activin** *n.* a protein complex that enhances the biosynthesis and secretion of follicle-stimulating hormone and helps to regulate the menstrual cycle. **Inhibin** is closely related and exerts an opposite effect: it down-regulates FSH synthesis and inhibits FSH secretion.

**activities of daily living (ADLs)** the tasks of everyday life. Basic ADLs include self-care tasks, such as bathing, dressing, eating, grooming, toileting, and moving. Instrumental ADLs include housework, shopping, managing finances, taking medication, and cooking. Inability to perform ADLs is a practical measure of disability in many disorders; problems are much more prevalent in the elderly.

**actomyosin** *n.* a protein complex formed in muscle between actin and myosin during the process of contraction. *See* **STRIATED MUSCLE**.

**acuity** *n.* *see* **VISUAL ACUITY**.

**acupuncture** *n.* a complementary therapy in which fine sterile needles are inserted into the skin at specific points on the body. It was developed by Eastern physicians, who recognize pathways (**meridians**) and flows of energy (called **qi**) within the body. It may work by allowing the body to release its own natural painkillers (**\*endorphins**). Acupuncture is used to relieve the symptoms of many physical and psychological conditions, including chronic pain.

**acute** *adj.* **1.** describing a disease of rapid onset, severe symptoms, and brief duration. *Compare* **CHRONIC**. **2.** describing any intense symptom, such as severe pain.

**acute abdomen** the sudden uncontrolled development of severe abdominal symptoms secondary to disease or injury. Failure to establish a prompt diagnosis may lead to rapid clinical decline. Perforation of a peptic ulcer, an inflamed appendix or colonic diverticulum, or rupture of the liver or spleen following a crush injury all produce an acute abdomen requiring urgent treatment.

**acute coronary syndrome** a combination of angina (unstable or stable), non-S–T elevation **\*myocardial infarction** (NSTEMI), and S–T elevation myocardial infarction (STEMI). It implies the presence of coronary artery disease.

**acute fatty liver of pregnancy** a rare and life-threatening complication of pregnancy that usually presents in the third trimester with symptoms of nausea, vomiting, malaise, and abdominal pain. Liver function tests are abnormal and the features of **\*pre-eclampsia** and often **\*HELLP syndrome** are present. **\*Hepatic encephalopathy**, **\*disseminated intravascular coagulation**, and renal failure may develop, and the condition is associated with a high maternal and fetal mortality. Treatment involves a multidisciplinary approach, usually in an intensive care unit.

**acute generalized exanthematous pustulosis (toxic pustuloderma)** a reaction to a medication, resulting in the appearance of fine sterile **\*pustules** on inflamed skin; the pustules may easily be overlooked. Common causes include penicillins, and pustular psoriasis must be excluded from the diagnosis.

**acute kidney injury** *see* **AKI**.

**acute renal failure** acute kidney injury (*see* **AKI**).

**acute respiratory distress syndrome** *see* **ADULT RESPIRATORY DISTRESS SYNDROME**.

**acute respiratory failure (ARF)** a primary disorder of gaseous exchange (as distinct from failure of the mechanical process of breathing). The prototype of ARF is **\*adult respiratory distress syndrome**, but the term sometimes also refers to disruption of any other part of the respiratory system, including the respiratory control centre in the brain with its **\*efferent** and **\*afferent** pathways.

**acute retinal necrosis (ARN)** severe inflammation and necrosis of the retina associated with inflammation and blockage of retinal blood vessels, haemorrhage and death of retinal tissue, and retinal detachment. It may affect both eyes (**bilateral acute retinal necrosis**, BARN), and visual prognosis is poor. ARN is thought to be due to viral infection.

**acute rheumatism** *see* RHEUMATIC FEVER.

**acute tubular necrosis (ATN)** a condition caused by acute renal injury from either ischaemia or toxins and associated with tubular damage that is usually reversible. The earliest feature is *\*isosthenuria*, which may occur while there is still a high urine flow rate. This is followed by a reduction in *\*glomerular filtration rate*. *\*Oliguria* is common and dialysis often needed for survival. If the cause of the initial damage can be removed, recovery of renal function within six weeks can be expected in most cases.

**acyclovir** *n. see* ACICLOVIR.

**ad-** *prefix denoting towards or near.* Examples: **adaxial** (towards the main axis); **adoral** (towards or near the mouth).

**ADA deficiency** *see* ADENOSINE DEAMINASE DEFICIENCY.

**adalimumab** *n.* a *\*cytokine inhibitor* used to treat severe rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, psoriasis, Crohn's disease, and ulcerative colitis. It can predispose to infections, and patients should be carefully monitored.

**Adam's apple (laryngeal prominence)** a projection, lying just under the skin, of the thyroid cartilage of the *\*larynx*.

**Adams–Stokes syndrome** *see* STOKES–ADAMS SYNDROME.

**ADAMTS13** *adisintegrin and metalloproteinase with athrombospondin type 1 motif, member 13*, also known as **von Willebrand factor-cleaving protease**: an enzyme that cleaves and degrades large von Willebrand factor multimers and decreases their activity, thereby disrupting *\*platelet activation*. Most cases of *\*thrombotic thrombocytopenic purpura* are as a result of inhibition or deficiency of ADAMTS13.

**adaptation** *n.* **1.** the phenomenon in which a sense organ shows a gradually diminishing response to continuous or repetitive stimulation. The nose, for example, may become adapted to the stimulus of an odour that is continuously present so that in time it ceases to report its presence. Similarly, the adaptation of touch receptors in the skin means that the presence of clothes

can be forgotten a few minutes after they have been put on. **2.** a process of change to enable adjustment to a condition or environment.

**addiction** *n.* a state of **\*dependence** produced either by the habitual taking of drugs or by regularly engaging in certain activities (e.g. gambling). People can develop physical and psychological symptoms of **\*dependence**, which include a strong desire to take the substance or exercise the behaviour, impaired capacity to control such behaviour or substance taking, a physical or psychological **\*withdrawal** state, evidence of **\*tolerance** development, social and mental preoccupation with substance use or the given behaviour, and persistent use despite harmful consequences. Treatment is directed to withdrawal of the drug or behaviour with the aim of partial or total abstinence. *See also* **ALCOHOLISM**; **TOLERANCE**.

**Addisonian crisis** an acute medical emergency due to a lack of corticosteroid production by the body, caused by disease of the adrenal glands or long-term suppression of production by steroid medication. It manifests as low blood pressure and collapse, biochemical abnormalities, hypoglycaemia, and (if untreated) coma and death. Treatment is with steroids, administered initially intravenously in high doses and later orally. In patients with poor adrenal function an Addisonian crisis is usually brought on by an acute illness, such as an infection. [T. Addison (1793–1860), British physician]

**Addison's disease** a syndrome resulting from inadequate secretion of corticosteroid hormones due to the progressive destruction of the adrenal cortex. It is characterized by progressive deterioration with hypotension and collapse due to severe dehydration, salt loss, and **\*hypoglycaemia**; dark pigmentation of the skin may occur. Formerly tuberculosis was a common cause, but the condition is now more likely to be due to autoimmune destruction of the adrenal cortices (*see* **AUTOIMMUNE DISEASE**). Treatment is with **\*hydrocortisone** and **\*fludrocortisone**. [T. Addison]

**adduct** *vb.* to move a limb or any other part towards the midline of the body.  
—**adduction** *n.*

**adductor** *n.* any muscle that moves one part of the body towards another or towards the midline of the body.

**adefovir dipivoxil** a drug used to treat chronic hepatitis B in patients who have not responded to or cannot tolerate interferon alfa or peginterferon alfa. Side-effects include gastrointestinal disturbances and headache.

**aden- (adeno-)** *combining form denoting a gland or glands.* Examples: **adenalgia** (pain in); **adenogenesis** (development of); **adenopathy** (disease of).

**adenine** *n.* one of the nitrogen-containing bases (*see* **PURINE**) that occurs in the nucleic acids DNA and RNA. *See also* **ATP**.

**adenitis** *n.* inflammation of a gland or group of glands (or glandlike structures). For example, **mesenteric adenitis** affects the lymph nodes (formerly called lymph glands) in the membranous support of the intestines (the mesentery). Causing abdominal pain, usually in children, it is a common, usually mild and self-limiting, condition. **Cervical adenitis** affects the lymph nodes in the neck.

**adenocarcinoma** *n.* a malignant epithelial tumour arising from glandular structures, which are constituent parts of most organs of the body. The term is also applied to tumours showing a glandular growth pattern. These tumours may be subclassified according to the substances that they produce, for example **mucinous** and **serous adenocarcinomas**, or to the microscopic arrangement of their cells into patterns, for example **papillary** and **follicular adenocarcinomas** (*see also* **CLEAR-CELL CARCINOMA**). They may be solid or cystic (**cystadenocarcinomas**).

**adenohypophysis** *n.* the anterior lobe of the **\*pituitary gland**.

**adenoidectomy** *n.* surgical removal of the **\*adenoids** in patients who suffer from either **\*glue ear** or difficulty in breathing through the nose.

**adenoids (nasopharyngeal tonsil)** *n.* a collection of lymphatic tissue in the **\*nasopharynx**. Enlargement of the adenoids can cause obstruction to breathing through the nose and can block the **\*Eustachian tubes**, causing **\*glue ear**.

**adenolymphoma** *n.* *see* **WARTHIN'S TUMOUR**.

**adenoma** *n.* a benign tumour of epithelial origin that is derived from glandular tissue or exhibits clearly defined glandular structures. Adenomas may undergo malignant change (see **ADENOCARCINOMA**). Some show recognizable tissue elements, such as fibrous tissue (**fibroadenomas**), while others, such as some bronchial adenomas, may produce active compounds giving rise to clinical syndromes (see **CARCINOID**). Tumours in certain organs, including the pituitary gland, are often classified by their histological staining affinities, for example **eosinophil**, **basophil**, and **chromophobe adenomas**.

**adenoma sebaceum** a condition in which angiofibromas (flesh-coloured or pink papules) are often seen around the nose and cheek or elsewhere on the face. They are a cutaneous sign of **\*tuberous sclerosis**.

**adenomyosis** *n.* see **ENDOMETRIOSIS**.

**adenosine** *n.* a **\*nucleoside** that contains adenine and the sugar ribose and occurs in **\*ATP**. It is also used as an **\*anti-arrhythmic** drug to stop **\*supraventricular tachycardias** and restore a normal heart rhythm. As such, it needs to be injected or infused quickly, which may fleetingly make the patient feel faint and develop chest pain.

**adenosine deaminase deficiency (ADA deficiency)** a genetic disorder affecting about one baby in 25,000 and characterized by a defect in **adenosine deaminase (ADA)**, an enzyme that is involved in purine metabolism. Deficiency of this enzyme results in selective damage to the antibody-producing lymphocytes; this in turn leads to a condition known as **\*severe combined immune deficiency (SCID)**, in which the affected baby has no resistance to infection and must be entirely isolated from birth. Such children have only about a 50% chance of surviving for six months. *See also* **GENE THERAPY**.

**adenosine diphosphate** see **ADP**.

**adenosine monophosphate** see **AMP**.

**adenosine triphosphate** see **ATP**.

**adenosis** *n.* (*pl.* adenoses) **1.** excessive growth or development of glands. **2.** any disease of a gland or glandlike structure, especially of a lymph node.

**adenovirus** *n.* one of a group of DNA-containing viruses causing infections of the upper respiratory tract that produce symptoms resembling those of the common cold.

**ADEPT** *n.* *antibody-directed enzyme prodrug therapy*: a method under development for the treatment of cancer. It involves the patient being injected first with an antibody-enzyme complex that binds specifically to tumour cells, and later with a *\*prodrug* that is inactive until it comes into contact with the antibody-enzyme complex. The enzyme converts the prodrug into a cytotoxic form, which is concentrated around the tumour and can therefore destroy the cancer cells without damaging normal tissue.

**ADH** antidiuretic hormone (*see* **VASOPRESSIN**).

**ADHD** *see* **ATTENTION-DEFICIT/HYPERACTIVITY DISORDER**.

**adherence** *n.* the degree to which a patient follows medical advice. **Medicines adherence** refers specifically to taking medication (**drug compliance**) but adherence may also be applied to physiotherapy exercises or attending appointments for courses of therapy. **Nonadherence** falls into two broad categories: **intentional nonadherence** involves the patient making a decision not to follow medical advice; in **unintentional nonadherence** the patient forgets or misunderstands the advice.

**adhesion** *n.* **1.** a fibrous band of connective tissue that develops in response to inflammation, trauma, or surgery, resulting in the union of two adjacent structures. Adhesions between loops of intestine often occur following abdominal surgery and may predispose to symptoms of abdominal pain or intestinal obstruction. If the pericardial sac is affected by an adhesion, the contractions of the heart may be restricted. **2.** a healing process in which the edges of a wound fit together. In **primary adhesion** there is very little *\*granulation* tissue; in **secondary adhesion** the two edges are joined together by granulation tissue.

**adhesion molecules** *\*cell-surface molecules* that are important for binding cells to neighbouring cells (**intercellular adhesion molecules, ICAM**) and tissues. Absence or weakening of intercellular binding facilitates the local spread of cancer.

**adhesive capsulitis** *see* FROZEN SHOULDER.

**Adie's pupil** *see* TONIC PUPIL. [W. J. Adie (1886–1935), British physician]

**Adie's syndrome (Holmes-Adie syndrome)** an abnormality of the pupils of the eyes, often affecting only one eye. The affected pupil is dilated and reacts slowly to light; the response on convergence *\*accommodation* of the eyes is also slow (*see* TONIC PUPIL). Tendon reflexes may be absent. The condition is almost entirely restricted to women. [W. J. Adie; Sir G. M. Holmes (1876–1965), British neurologist]

**adipocere** *n.* a waxlike substance, consisting mainly of fatty acids, into which the soft tissues of the body can be converted after death. This usually occurs when the body is buried in damp earth or is submerged in water. Adipocere delays post-mortem decomposition and is a spontaneous form of preservation without mummification.

**adipocyte** *n. see* ADIPOSE TISSUE.

**adipose tissue** fibrous *\*connective tissue* packed with masses of fat cells (**adipocytes**). In human adults it consists mostly of **white fat** (*see also* BROWN FAT). It forms a thick layer under the skin and occurs around the kidneys and in the buttocks. It serves both as an insulating layer and an energy store; food in excess of requirements is converted into fats and stored within these cells.

**adiposis (liposis)** *n.* the presence of abnormally large accumulations of fat in the body. The condition may arise from overeating, hormone irregularities, or a metabolic disorder. In **adiposis dolorosa**, a condition affecting women more commonly than men, painful fatty swellings are associated with defects in the nervous system. *See also* OBESITY.

**adipsia** *n. see* HYPODIPSIA.

**aditus** *n.* an anatomical opening or passage; for example, the opening of the tympanic cavity (middle ear) to the air spaces of the mastoid process.

**adjunct** *n.* a subsidiary drug used in treating a disorder, which provides additional benefits to the main drug used in treatment. For example, the

**\*dopamine** receptor agonist cabergoline is used as an adjunct to levodopa in the treatment of Parkinson's disease. —**adjunctive** *adj.*

**adjuvant** *n.* any substance used in conjunction with another to enhance its activity. Aluminium salts are used as adjuvants in the preparation of vaccines from the toxins of diphtheria and tetanus: by keeping the toxins in precipitated form, the salts increase the efficacy of the toxins as antigens.

**adjuvant therapy** treatment given to patients after the primary therapy, which is usually surgical removal of the tumour, when there is a high risk of future recurrence based on tumour stage and histology. Adjuvant therapy is aimed at destroying these microscopic tumour cells either locally (e.g. adjuvant breast irradiation after breast-conserving surgery) or systemically (e.g. adjuvant chemotherapy may be recommended for patients with breast cancer, colorectal cancer, and other types of cancer). *Compare* **NEOADJUVANT CHEMOTHERAPY**.

**ADLs** *see* **ACTIVITIES OF DAILY LIVING**.

**admission rate** the number of people from a specified population with a specified disease or condition admitted to hospitals in a given geographical area over a specified time period.

**adnexa** *pl. n.* adjoining parts. For example, the **uterine adnexa** are the Fallopian tubes and ovaries (which adjoin the uterus).

**adolescence** *n.* the stage of development between childhood and adulthood. It begins with the start of **\*puberty**, which in girls is usually at the age of 12–13 years and in boys about 14 years, and usually lasts until 19 years of age. All adolescents must learn gradually to exercise their own **\*autonomy**, whether they have legal **\*capacity** or not. Clinicians may not know who has the **\*responsibility** to take decisions without careful thought and discussion (*see also* **GILLICK COMPETENCE**).

**ADP (adenosine diphosphate)** a compound containing adenine, ribose, and two phosphate groups. ADP occurs in cells and is involved in processes requiring the transfer of energy (*see* **ATP**).

**adrenalectomy** *n.* the surgical removal of an **\*adrenal gland**, usually performed because of neoplastic disease.

**adrenal glands (suprarenal glands)** two triangular **\*endocrine glands**, each of which covers the superior surface of a kidney. Each gland has two parts, the **medulla** and **cortex**. The medulla forms the grey core of the gland; it consists mainly of **\*chromaffin** tissue and is stimulated by the sympathetic nervous system to produce **\*adrenaline** and **\*noradrenaline**. The cortex is a yellowish tissue surrounding the medulla. It is derived embryologically from mesoderm and is stimulated by pituitary hormones (principally **\*ACTH**) to produce three kinds of **\*corticosteroid** hormones, which affect carbohydrate metabolism (e.g. **\*cortisol**), electrolyte metabolism (e.g. **\*aldosterone**), and the sex glands (oestrogens and androgens).

**adrenaline (epinephrine)** *n.* an important hormone secreted by the medulla of the adrenal gland. It has the function of preparing the body for 'fright, flight, or fight' and has widespread effects on circulation, the muscles, and sugar metabolism. The action of the heart is increased, the rate and depth of breathing are increased, and the metabolic rate is raised; the force of muscular contraction improves and the onset of muscular fatigue is delayed. At the same time the blood supply to the bladder and intestines is reduced, their muscular walls relax, and the sphincters contract. Sympathetic nerves were originally thought to act by releasing adrenaline at their endings, and were therefore called **adrenergic** nerves. In fact the main substance released is the related substance **\*noradrenaline**, which also forms a portion of the adrenal secretion.

Adrenaline given by injection is used in the emergency treatment of anaphylaxis and cardiac arrest. It is also included in some local anaesthetic solutions, particularly those used in dentistry, to prolong anaesthesia, and is used as eye drops for treating glaucoma.

**adrenarche** *n.* the start of secretion of **\*androgens** by the adrenal glands, occurring at around 6–7 years of age in girls and 7–8 in boys. It is usually determined by the measurement of urinary 17-ketosteroids rather than direct assay of the androgens themselves. Adrenal androgens are **\*dehydroepiandrosterone** (DHEA), DHEA sulphate, and androstenedione. The age of adrenarche is unrelated to the age of **\*gonadarche**. Premature adrenarche is usually manifested as the early appearance of pubic hair due to levels of the adrenal androgens equivalent to those found in puberty. It does not proceed to full puberty as the gonads do not become active.

**adrenergic** *adj.* **1.** describing nerve fibres that release noradrenaline or adrenaline as a neurotransmitter. **2.** describing receptors that are stimulated by noradrenaline or adrenaline. *See* ADRENOCEPTOR.

**adrenoceptor (adrenoreceptor, adrenergic receptor)** any cell *\*receptor* that binds with the catecholamines adrenaline or noradrenaline, the neurotransmitters of the *\*sympathetic nervous system*. There are two principal types of adrenoceptor, alpha ( $\alpha$ ) and beta ( $\beta$ ), with various subtypes of each. **Alpha adrenoceptors** have a slightly higher affinity for adrenaline than for noradrenaline; they can be divided into subtypes  $\alpha_1$  and  $\alpha_2$ .  $\alpha_1$ -adrenoceptors mediate contraction of smooth muscle; in the walls of arteries, for example, their stimulation causes constriction of arteries and a rise in blood pressure.  $\alpha_2$ -adrenoceptors occur in the presynaptic membranes of neurons in the sympathetic nervous system, where they restrict the release of catecholamines from these neurons. **Beta adrenoceptors** also have two subtypes.  $\beta_1$ -adrenoceptors have an equal affinity for adrenaline and noradrenaline and are found mainly in cardiac muscle; their stimulation causes an increase in heart rate.  $\beta_2$ -adrenoceptors have a slightly higher affinity for adrenaline. They mediate relaxation of smooth muscle in the blood vessels, bronchi, bladder, uterus, and other organs and thus cause widening of the airways and *\*vasodilatation*.

Drugs that stimulate these receptors (alpha agonists and beta agonists) are described as *\*sympathomimetic*. Drugs that block their effects are the *\*alpha blockers* and *\*beta blockers*.

**adrenocorticotrophic hormone (adrenocorticotrophin)** *see* ACTH.

**adrenogenital syndrome** a hormonal disorder resulting from abnormal steroid production by the adrenal cortex, due to a genetic fault. It may cause masculinization in girls, precocious puberty in boys, and adrenocortical failure (*see* ADDISON'S DISEASE) in both sexes. Treatment is by lifelong steroid replacement.

**adrenoleukodystrophy** *n.* a genetically determined condition of neurological degeneration with childhood and adult forms. Inherited as an X-linked (*see* SEX-LINKED) trait resulting in *\*demyelination*, it is characterized by progressive *\*spastic paralysis* of the legs, sensory loss, and cognitive

impairment, associated with adrenal gland insufficiency and small gonads. The demonstration of a genetic defect in the metabolism of very long chain fatty acids aids diagnosis and has implications for future possible drug therapies. Prenatal diagnosis is possible.

**adrenolytic** *adj.* inhibiting the activity of **\*adrenergic** nerves. Adrenolytic activity is opposite to that of **\*noradrenaline**.

**adult respiratory distress syndrome (acute respiratory distress syndrome, ARDS)** a form of **\*acute respiratory failure** that occurs after a precipitating event, such as trauma, aspiration, or inhalation of a toxic substance; it is particularly associated with septic shock. Lung injury is characterized by reduced oxygen in the arteries, reduced lung volume, and decreased lung compliance, and diffuse infiltrates are seen on a chest X-ray. Treatment is correction of the original cause, volume replacement, diuretics, oxygen, and mechanical ventilation.

**advanced glycation end-products** damaged proteins that result from the **\*glycation** of a large number of body proteins, which can accumulate and cause permanent damage to tissues. This damage is more prevalent in diabetics due to chronic exposure to blood with high concentrations of glucose. It is believed to be partly responsible for the damage to the kidneys, eyes, and blood vessels that characterizes long-standing diabetes.

**advance directive, decision, or statement** (in England and Wales under the Mental Capacity Act 2005) a legally recognized decision or statement by an adult with **\*capacity** identifying any specific or general treatment the patient does not want in the event that he or she loses capacity. An **advance directive** or **decision** (formerly often called a **living will**) should be informed, made voluntarily, and must be valid and applicable to the medical situation that arises; at the extreme it can constitute an advance refusal of potentially life-saving treatment. It cannot, however, be used to demand future treatment and does not apply as long as the person retains capacity. An **advance statement** is a more general and less legally binding expression of the person's values and views on the sort of treatment he or she may or may not wish to undergo. Directives and statements can raise ethical questions: for example, should life-saving treatment refused in advance nevertheless be given if it could restore the patient to a quality of life with which he or she was content before losing capacity.

**advanced life support (ALS)** a structured and algorithm-driven method of life support for use in the severest of medical emergencies, especially cardiac arrest. Doctors, nurses, and paramedic personnel involved in ALS receive special training in the use of equipment (e.g. defibrillators and appropriate drugs). **Paediatric advanced life support (PALS)** is ALS for use in severe medical emergencies in children, while **advanced trauma life support(ATLS)** is specifically for patients who have been subjected to major trauma, such as a serious road accident. *Compare* **BASIC LIFE SUPPORT**.

**advancement** *n.* the detachment by surgery of a muscle, musculocutaneous flap, or tendon from its normal attachment site and its reattachment at a more advanced (anterior) point while preserving its previous nerve and blood supply. The technique is used, for example, in the treatment of squint and extensively in plastic surgery to cover large defects (*see also* **PEDICLE**).

**adventitia (tunica adventitia)** *n.* **1.** the outer coat of the wall of a **\*vein** or **\*artery**. It consists of loose connective tissue and networks of small blood vessels, which nourish the walls. **2.** the outer covering of various other organs or parts.

**adventitious** *adj.* **1.** occurring in a place other than the usual one. **2.** relating to the adventitia.

**advocacy** *n.* a role that involves acting as a proxy or speaking on behalf of a patient because the patient lacks **\*capacity**. Under the Mental Capacity Act 2005, capacitous adults may legally nominate a proxy or an **advocate** to make health-care decisions on their behalf in the event of losing capacity. For patients without family or legally appointed advocates, the **\*Independent Mental Capacity Advocate** should be contacted when making significant medical decisions. Health-care professionals may see their role as including advocacy for patients, e.g. in accessing services. In addition, there are many organized advocacy groups to support patients with specific conditions, such as Alzheimer's disease. Finally, every NHS trust has a **\*Patient Advice and Liaison Service (PALS)**, which can take on the role of supporting patients. *See also* **PROXY DECISION**; **SUBSTITUTED JUDGMENT**.

**AECOPD** *acute exacerbation of COPD (see CHRONIC OBSTRUCTIVE PULMONARY DISEASE).*

**AED** *see AUTOMATED EXTERNAL DEFIBRILLATOR.*

**Aedes** *n.* a genus of widely distributed mosquitoes occurring throughout the tropics and subtropics. Most species are black with distinct white or silvery-yellow markings on the legs and thorax. *Aedes* species are not only important as vectors of \*dengue, \*yellow fever, \*filariasis, and Group B viruses causing encephalitis but also constitute a serious biting nuisance. *A. aegypti* is the principal vector of dengue and yellow fever.

**aegophony** *n. see VOCAL RESONANCE.*

**-aemia** *combining form denoting a specified biochemical condition of the blood. Example: hyperglycaemia (excess sugar in the blood).*

**aer- (aero-)** *combining form denoting air or gas. Examples: aerogastria (gas in the stomach); aerogenesis (production of gas).*

**aerobe** *n.* any organism, especially a microbe, that requires the presence of free oxygen for life and growth. *See also ANAEROBE; MICROAEROPHILIC.*

**aerobic** *adj.* **1.** of or relating to aerobes: requiring free oxygen for life and growth. **2.** describing a type of cellular \*respiration in which foodstuffs (carbohydrates) are completely oxidized by atmospheric oxygen, with the production of maximum chemical energy from the foodstuffs.

**aerobic exercises** *see EXERCISE.*

**aerodontalgia** *n.* pain in the teeth due to change in atmospheric pressure during air travel or the ascent of a mountain.

**aeroneurosis** *n.* a syndrome of anxiety, agitation, and insomnia found in pilots flying unpressurized aircraft and attributed to \*anoxia.

**aerophagia (aerophagy)** *n.* the swallowing of air. This may be done voluntarily to stimulate belching, accidentally during rapid eating or drinking, or unconsciously as a habit. Voluntary aerophagia is used to permit oesophageal speech after surgical removal of the larynx (usually for cancer).

**aerosol** *n.* a suspension of extremely small liquid or solid particles (about 0.001 mm diameter) in a gas. Drugs for inhalation are in aerosol form.

**aetiology (etiology)** *n.* **1.** the study or science of the causes of disease. **2.** the cause of a specific disease.

**afebrile** *adj.* without, or not showing any signs of, a fever.

**affect** *n.* (in psychiatry) **1.** the predominant emotion in a person's mental state at a particular moment. **Blunted affect** is a diminished intensity of emotional response; it is a feature of some forms of chronic *\*schizophrenia*. **Flat affect** is an inability to respond emotionally despite the presence of emotions. It is commonly seen in depression. **Incongruent affect** describes an inappropriate emotional response to a situation (e.g. laughing at a funeral) and may be seen in psychotic illnesses. **2.** the emotion associated with a particular idea. —**affective** *adj.*

**affective disorder (mood disorder)** any psychiatric disorder featuring abnormalities of mood or emotion (*\*affect*). The most serious of these are *\*depression* and *\*mania*. Other affective disorders include *\*SAD* (seasonal affective disorder).

**afferent** *adj.* **1.** designating nerves or neurons that convey impulses from sense organs and other receptors to the brain or spinal cord, i.e. any sensory nerve or neuron. **2.** designating blood vessels that feed a capillary network in an organ or part. **3.** designating lymphatic vessels that enter a lymph node. *Compare* EFFERENT.

**Affordable Care Act 2010 (ACA)** US federal legislation that introduced the most sweeping reforms to the US health-care system since the launch of *\*Medicaid* and *\*Medicare* in 1965. Under the Act private insurers are placed under an obligation to accept all applicants; to charge the same premiums to all applicants of the same age, regardless of pre-existing conditions; and to provide certain 'essential health benefits' under every policy. A further provision, mandating all adults not otherwise covered to take out a private policy, was repealed in 2019. The Act also expanded eligibility to Medicaid, took steps to constrain the costs of Medicare, and encouraged more employers to provide schemes to their employees; there were also reforms to health-care delivery. Known in full as the **Patient Protection and**

**Affordable Care Act (PPACA)**, the legislation is often referred to colloquially as **Obamacare**, after President Barack Obama, who introduced it.

**afibrinogenaemia** *n.* complete absence of the coagulation factor **\*fibrinogen** in the blood. *Compare* **HYPOFIBRINOGENAEMIA**.

**aflatoxin** *n.* a poisonous substance produced in the spores of the fungus *Aspergillus flavus*, which infects peanuts. The toxin is known to produce cancer in certain animals and is suspected of being the cause of liver cancers in human beings living in warm and humid regions of the world, where stored nuts and cereals may be contaminated by the fungus.

**aflibercept** *n.* a drug that inhibits the action of vascular endothelial growth factor A (VEGF-A) and thereby prevents the development of new blood vessels (*see* **ANGIOGENESIS INHIBITOR**). It is injected into the vitreous humour to stop abnormal blood vessel growth and leakage in the eye(s) in treating wet age-related **\*macular degeneration** and is given by intravenous infusion, in combination with chemotherapy drugs, to treat metastatic colorectal cancer.

**AFP** *see* **ALPHA-FETOPROTEIN**.

**afterbirth** *n.* the placenta, umbilical cord, and ruptured membranes associated with the fetus, which normally become detached from the uterus and expelled within a few hours of birth.

**aftercare** *n.* long-term surveillance or rehabilitation as an adjunct or supplement to formal medical treatment of those who are chronically sick or disabled, including those with mental illness or learning disability. Aftercare includes the provision of equipment and the adaptation of homes to aid **\*activities of daily living**.

**after-image** *n.* an impression of an image that is registered by the brain for a brief moment after an object is removed from in front of the eye, or after the eye is closed. A **positive afterimage**, which lasts a few seconds, retains the colour and brightness of the original image; the more common **negative afterimage** lasts longer and has colours and brightness that are complementary to the original.

**afterpains** *pl. n.* pains caused by uterine contractions after childbirth, especially during breast feeding, due to release of the hormone **\*oxytocin**. The contractions help restore the uterus to its nonpregnant size and are more common in women who have given birth twice or more.

**agammaglobulinaemia** *n.* a total deficiency of the plasma protein **\*gammaglobulin**. Compare **HYPOGAMMAGLOBULINAEMIA**.

**agar** *n.* an extract of certain seaweeds that forms a gel suitable for the solidification of liquid bacteriological **\*culture** media. **Blood agar** is nutrient agar containing 5–10% horse blood, used for the cultivation of certain bacteria or for detecting haemolytic (blood-destroying) activity.

**agenesis** *n.* absence of an organ, usually due to total failure of its development in the embryo. Dental agenesis (also known as **\*hypodontia**) is the most common developmental anomaly in humans and may be caused by genetic defects in codes for transcription factors, proteins, and fibroblast growth factors.

**age-related macular degeneration (AMD, ARMD)** *see* **MACULAR DEGENERATION**.

**Age UK** the UK's largest charity for older people, formed in 2009 from the merger of Age Concern and Help the Aged. Related charities exist for the UK's devolved nations: Age Scotland, Age Cymru, and Age NI.

<https://www.ageuk.org.uk/>

- Website of Age UK: includes advice on health and lifestyle issues affecting older people

**agglutination (clumping)** *n.* the sticking together, by serum antibodies called **agglutinins**, of such microscopic antigenic particles as red blood cells or bacteria so that they form visible clumps. Any substance that stimulates the body to produce an agglutinin is called an **agglutininogen**. Agglutination is a specific reaction; in the laboratory, sera containing different known agglutinins provide an invaluable means of identifying unknown bacteria. When blood of different groups is mixed, agglutination occurs because serum

contains natural antibodies (**isoagglutinins**) that attack red cells of a foreign group, whether previously encountered or not. This is not the same process as occurs in **\*blood coagulation**.

**agglutinin** *n.* an antibody that brings about the **\*agglutination** of bacteria, blood cells, or other antigenic particles.

**agglutininogen** *n.* any antigen that provokes formation of an agglutinin in the serum and is therefore likely to be involved in **\*agglutination**.

**aglossia** *n.* congenital absence of the tongue.

**agnathia** *n.* congenital absence of the lower jaw, either partial or complete.

**agnosia** *n.* a disorder of the brain whereby the patient cannot interpret sensations correctly although the sense organs and nerves conducting sensation to the brain are functioning normally. It is due to a disorder of the **\*association areas** in the parietal lobes. In **auditory agnosia** the patient can hear but cannot interpret sounds (including speech). A patient with **tactile agnosia (astereognosis)** retains normal sensation in his hands but cannot recognize three-dimensional objects by touch alone. In **visual agnosia** the patient can see but cannot interpret symbols, including letters (*see* **ALEXIA**).

**agonal** *adj.* describing or relating to the phenomena, such as cessation of breathing or change in the ECG or EEG, that are associated with the moment of death. For example, an **agonal rhythm** describes the ECG of a dying patient, characterized by slow, irregular, and wide ventricular complexes that eventually stop (*see* **ELECTROCARDIOGRAM**). It is often seen in the terminal stages of a failed attempt at cardiac resuscitation.

**agonist** *n.* **1. (prime mover)** a muscle whose active contraction causes movement of a part of the body. Contraction of an agonist is associated with relaxation of its **\*antagonist**. **2.** a drug or other substance that acts at a cell-receptor site to produce an effect that is the same as, or similar to, that of the body's normal chemical messenger. **\*Sympathomimetic** drugs (alpha agonists and beta agonists) are examples.

**agoraphobia** *n.* a morbid fear of public places and/or of open spaces. *Compare* **CLAUSTROPHOBIA**. *See also* **PHOBIA**.

**agranulocytosis** *n.* a disorder in which there is a severe acute deficiency of certain blood cells (**\*neutrophils**) as a result of damage to the bone marrow by toxic drugs or chemicals. It is characterized by fever, with ulceration of the mouth and throat, and may lead rapidly to prostration and death. Treatment is by the administration of antibiotics in large quantities. When feasible, transfusion of white blood cells may be life-saving.

**agraphia (dysgraphia)** *n.* an acquired inability to write, although the strength and coordination of the hand remain normal. It is related to the disorders of language and it is caused by disease in the dominant **\*parietal lobe** of the brain. See **GERSTMANN'S SYNDROME**.

**ague** *n.* see **MALARIA**.

**Ahmed valve** a **\*shunt** used in the treatment of **\*glaucoma** to reduce and control intraocular pressure. The device works by bypassing the **\*trabecular meshwork** and redirecting the outflow of aqueous humour through a small tube into an outlet chamber.

**AHSN** see **ACADEMIC HEALTH SCIENCE NETWORK**.

**Aicardi syndrome** a syndrome caused by abnormal development of the brain in which the two halves of the brain do not connect. The **\*corpus callosum** is absent. Affected individuals suffer from learning disability and seizures. They may also have associated abnormalities of the eyes and spine. [J. D. Aicardi (20th century), French neurologist]

**AIDS (acquired immune deficiency syndrome)** a syndrome first identified in Los Angeles in 1981; a description of the causative virus – the human immunodeficiency virus (**\*HIV**) – was available in 1983. The virus destroys a subgroup of lymphocytes, the **\*helper T cells** (or **\*CD4** lymphocytes), resulting in suppression of the body's immune response (see **IMMUNITY**). Acute (primary) infection following exposure to the virus results in the production of antibodies (seroconversion); their presence, detected by standard tests, indicates that infection has taken place. Primary infection may be accompanied by mild or severe symptoms, lasting an average of 14 days, including fever, fatigue, lymphadenopathy, headache, and rash. Chronic HIV infection, which follows primary infection, lasts an average of 10 years, during which the person may be asymptomatic; it is followed by the

development of AIDS. AIDS can be defined by a CD4 level less than 200 cells/ $\mu$  or by the presence of an AIDS-defining illness, such as *\*Kaposi's sarcoma*, recurrent pneumonia (especially caused by *\*Pneumocystis jiroveci*), any of various lymphomas, or any of certain cytomegalovirus-related diseases.

AIDS is largely a sexually transmitted disease, either homosexually or heterosexually. The two other main routes of spread are via infected blood or blood products (as by drug users sharing contaminated needles) and by the maternofetal route. The virus may be transmitted from an infected mother to the child in the uterus or it may be acquired from maternal blood during parturition; it may also be transmitted in breast milk. HIV has been isolated from semen, cervical secretions, plasma, cerebrospinal fluid, tears, saliva, urine, and breast milk but the concentration shows wide variations. Moreover HIV is a fragile virus and does not survive well outside the body. It is therefore considered that ordinary social contact with HIV-positive subjects involves no risk of infection. However, high standards of clinical practice are required by all health workers in order to avoid inadvertent infection via blood, blood products, or body fluids from HIV-positive people. Staff who become HIV-positive are expected to declare their status and will be counselled.

Until recently, AIDS was considered to be universally fatal, although the type and length of illness preceding death varies considerably. However, with the development of *\*antiretroviral drugs* used in dual or triple combinations, AIDS is now perceived as a chronic disease rather than a fatal one.

<https://www.tht.org.uk/>

- Website of the Terence Higgins Trust: includes information on HIV, AIDS, and sexual health

**AIH** *see* **ARTIFICIAL INSEMINATION**.

**ainhum** *n.* loss of one or more toes due to slow growth of a fibrous band around the toe that eventually causes a spontaneous amputation. The condition is rare, found mainly in Africa and associated with going barefoot.

**air bed** a bed with a mattress whose upper surface is perforated with thousands of holes, through which air is forced under pressure. The patient is thus supported, like a hovercraft, on a cushion of air. This type of bed is invaluable for the treatment of patients with large areas of burns.

**air embolism** an air bubble that suddenly obstructs blood flow down a blood vessel. Air may gain access to the circulation as a result of surgery, injury, intravenous infusions, or intravascular catheters.

**air sickness** *see* MOTION SICKNESS.

**airway** *n.* **1.** any of the passages of the respiratory system. **2.** any device that enables the flow of air into and out of the lungs. *See* NASOPHARYNGEAL AIRWAY; OROPHARYNGEAL AIRWAY.

**airway obstruction** blockage of any of the passages by which air enters (and leaves) the lungs, which may be partial or complete. In partial obstruction, the patient can still move some air in and out of the lungs but often with difficulty. There may be a distinctive sound (*see* STRIDOR) on inspiration through a partly obstructed airway. Complete obstruction will rapidly lead to respiratory and then cardiac arrest and requires prompt airway clearance and support.

**akathisia** *n.* a pattern of involuntary movements induced by medication, for example \*antipsychotic drugs or (more rarely) antidepressants. An affected person is driven to restless overactivity, which can be confused with the agitation for which the drug was originally prescribed. Akathisia is mostly felt as restless legs (*see* RESTLESS LEGS SYNDROME) rather than generalized agitation or anxiety. Antipsychotics are the main cause of akathisia but the severity depends on their affinity to \*dopamine receptors. In a recent systematic review haloperidol, zotepine, and chlorpromazine were most likely to cause akathisia, with olanzapine least likely, and clozapine causing no akathisia at all. *See also* EXTRAPYRAMIDAL EFFECTS.

**AKI** acute kidney injury, also called acute renal failure. Dehydration often leads to AKI. The diagnosis is usually based on changes in the serum creatinine concentration or the detection of \*oliguria, neither of which is ideal as they tend to lag behind the phase of acute injury.

**akinesia** *n.* a loss of normal muscular tonicity or responsiveness. **Akinetic rigid syndrome** is used to describe such conditions as **\*parkinsonism** and **\*progressive supranuclear palsy**. In **akinetic epilepsy** there is a sudden loss of muscular tonicity, making the patient fall with momentary loss of consciousness. **Akinetic mutism** is a state of complete physical unresponsiveness although the patient's eyes remain open and appear to follow movements. It is a consequence of damage to the **\*brainstem** area of the brain. —**akinetic** *adj.*

**ala** *n.* (*pl.* **alae**) (in anatomy) a winglike structure; for example, either of the two lateral flared portions of the external nose or the winglike expansion of the ilium.

**alactasia** *n.* absence or deficiency of the enzyme lactase, which is essential for the digestion of milk sugar (lactose). All babies have lactase in their intestines, but the enzyme disappears during childhood in about 10% of northern Europeans, 40% of Greeks and Italians, and 80% of Africans and Asians. Alactasia causes symptoms only if the diet regularly includes raw milk, when the undigested lactose causes diarrhoea and abdominal pain.

**Alagille syndrome (arteriohepatic dysplasia)** an inherited condition in which the bile ducts, which drain the liver, become progressively smaller, causing increased **\*jaundice**. It is associated with abnormalities of other organs, such as the heart, kidneys, eyes, and spine. [D. Alagille (1925–2005), French physician]

**alanine** *n.* *see* **AMINO ACID**.

**alanine aminotransferase (ALT)** an enzyme involved in the transamination of amino acids. Measurement of ALT in the serum is of use in the diagnosis and study of acute liver disease. It was formerly called **serum glutamic pyruvic transaminase (SGPT)**.

**ALARA principle** *see* **RADIATION PROTECTION**.

**alastrim** *n.* a mild form of smallpox, causing only a sparse rash and low-grade fever. Medical name: **variola minor**.

**albendazole** *n.* an **\*anthelmintic** drug used for treating **\*hydatid disease**, **\*hookworm disease**, **\*strongyloidiasis**, and **\*creeping eruption**. Possible

side-effects include headache, dizziness, fever, skin rashes, and loss of hair.

**Albers-Schönberg disease** *see* **OSTEOPETROSIS**. [H. E. Albers-Schönberg (1865–1921), German radiologist]

**Alberti regime (GIK regime)** a method for controlling blood-sugar levels in diabetic patients who are being fasted for whatever reason. It involves infusing a solution of glucose (G), insulin (I), and potassium (K) chloride intravenously over a standard time period. Blood sugar and potassium are measured frequently so that appropriate adjustments can be made to the mixture as necessary. [K. G. M. M. Alberti (1937– ), British physician]

**albinism** *n.* the inherited absence of pigmentation in the skin, hair, and eyes, resulting in white hair and pink skin and eyes. The pink colour is produced by blood in underlying blood vessels, which are normally masked by pigment. Ocular signs are reduced visual acuity, sensitivity to light (*see* **PHOTOPHOBIA**), and involuntary side-to-side eye movements.

**albino** *n.* an individual lacking the normal body pigment (melanin). *See* **ALBINISM**.

**Albright's hereditary osteodystrophy** the skeletal abnormalities, collectively, of **\*pseudohypoparathyroidism**. These include short stature, abnormally short fingers and toes (particularly involving the fourth and fifth metacarpals and metatarsals), and soft-tissue calcification. [F. Albright (1900–69), US physician]

**albumin** *n.* a protein that is soluble in water and coagulated by heat. An example is **serum albumin**, which is found in blood plasma and is important for the maintenance of plasma volume. Albumin is synthesized in the liver; the inability to synthesize it is a prominent feature of chronic liver disease (**\*cirrhosis**).

**albuminuria (proteinuria)** *n.* the presence of serum albumin, serum globulin, or other serum proteins in the urine. This may be associated with kidney or heart disease. Albuminuria is not always associated with disease: it may occur after strenuous exercise or after a long period of standing (**orthostatic albuminuria**).

**albumose** *n.* a substance, intermediate between albumin and peptones, produced during the digestion of proteins by pepsin and other endopeptidases (see **PEPTIDASE**).

**alcaptonuria (alkaptonuria)** *n.* the congenital absence of an enzyme, homogentisic acid oxidase, that is essential for the normal breakdown of the amino acids tyrosine and phenylalanine. Accumulation of **\*homogentisic acid** causes dark brown discoloration of the skin and eyes (**ochronosis**) and progressive damage to the joints, especially of the spine. The gene responsible for the condition is recessive, so that a child is affected only if both parents are carriers of the defective gene.

**alclometazone** *n.* a **\*corticosteroid** drug applied as a cream to treat inflammatory skin disorders. Possible side-effects include skin thinning and allergic reactions.

**alcohol** *n.* any of a class of organic compounds formed when a hydroxyl group (–OH) is substituted for a hydrogen atom in a hydrocarbon. The alcohol in alcoholic drinks is **ethyl alcohol (ethanol)**, which has the formula  $C_2H_5OH$ . It is produced by the fermentation of sugar by yeast. ‘Pure’ alcohol contains not less than 94.9% by volume of ethyl alcohol. It is obtained by distillation. A solution of 70% alcohol can be used as a preservative or antiseptic. When taken into the body ethyl alcohol depresses activity of the central nervous system (see also **ALCOHOLISM**). **\*Methyl alcohol** (methanol) is extremely poisonous. See **Appendix 11**.

**alcoholic hallucinosis** **\*hallucinations** in the context of **\*alcoholism**. They are usually shortlived **\*auditory** hallucinations (‘hearing voices’). Although abstinence is the best remedy, they can persist beyond the active use of alcohol and are often difficult to treat (a recent review showed a dearth of data regarding all possible treatment options).

**Alcoholics Anonymous (AA)** an international voluntary agency of mutual support that is organized and operated locally among those with alcohol dependency. Members are expected to follow a 12-step programme, which includes admitting to their drink problems, recognizing a higher spiritual power that gives strength to overcome these problems, and helping and supporting fellow members.

<https://www.alcoholics-anonymous.org.uk/>

- Website of Alcoholics Anonymous

**alcoholism** *n.* the syndrome due to physical *\*dependence* on alcohol, such that sudden deprivation may cause withdrawal symptoms – tremor, anxiety, hallucinations, and delusions (*see* **DELIRIUM TREMENS**). The risk of alcoholism for an individual depends on genetic and environmental factors. Several years' heavy drinking is often needed for addiction to develop, with a wide range from 1 to 40 years. Alcoholism impairs intellectual function, physical skills, memory, and judgment. Social skills can also be affected. Heavy consumption of alcohol causes *\*cardiomyopathy*, *\*peripheral neuropathy*, *\*cirrhosis* of the liver, and enteritis. Treatment is usually provided on an out-patient basis, in specialist units for detoxification or medical wards. Unsupervised sudden withdrawal carries a mortality of about 10%, mostly due to seizures. If there are complicating psychiatric problems detoxification may be part of psychiatric treatment. Psychological aspects of treatment include helping the patient to understand the psychological pressures that led to his or her heavy drinking, treatment of underlying anxiety, and *\*motivational interviewing*. Drugs such as *\*disulfiram* (Antabuse), which cause vomiting if alcohol is taken, can help in treatment. Drugs to reduce craving, such as *\*acamprosate calcium*, are less successful, with around a third of patients benefiting.

**aldesleukin** *n.* *see* **INTERLEUKIN**.

**aldosterone** *n.* a steroid hormone (*see* **CORTICOSTEROID**) that is synthesized and released by the adrenal cortex and acts on the kidney to regulate salt (potassium and sodium) and water balance.

**aldosteronism (hyperaldosteronism)** *n.* overproduction of aldosterone, one of the hormones secreted by the adrenal cortex, usually due to a benign tumour (adenoma) in the cortex or hyperplasia of that tissue. It leads to abnormalities in the amounts of sodium, potassium, and water in the body. It is a rare cause of raised blood pressure (hypertension). *See also* **CONN'S SYNDROME**.

**alendronic acid (sodium alendronate)** a **\*bisphosphonate** drug that is administered for the prevention and treatment of osteoporosis and fragility fractures in men and postmenopausal women or induced by corticosteroid therapy in women. Immediate side-effects may include abdominal pain, indigestion, and oesophageal irritation or pain. Long-term use (5–10 years) may increase the risk of poor dental healing and atypical fractures of the thigh bone (femur).

**Aleppo boil** *see* **ORIENTAL SORE**.

**alerting device** *see* **ENVIRONMENTAL HEARING AID**.

**alexia** *n.* an acquired inability to read. It is due to disease in the left (dominant) hemisphere of the brain in a right-handed person. In **agnosic alexia (word blindness)** the patient cannot read because he is unable to identify the letters and words, but he retains the ability to write and his speech is normal. This is a form of **\*agnosia**. A patient with **aphasic alexia (visual asymbolia)** can neither read nor write and often has an accompanying disorder of speech. This is a form of **\*aphasia**. *See also* **DYSLEXIA**.

**alexin** *n.* a former name for the serum component now called **\*complement**.

**alexithymia** *n.* an inability to express one's emotions or describe them in words, commonly accompanied by a lack of empathy for the feelings of others. Most often seen in males, it is associated with autistic spectrum disorders (*see* **AUTISM**) and also with certain eating disorders.

**alfacalcidol** *n.*  $1\alpha$ -hydroxycholecalciferol: a derivative of vitamin D that is used to raise blood calcium levels for the prevention or treatment of rickets and **\*osteomalacia** in patients with severe kidney disease.

**alfentanil** *n.* an opioid **\*analgesic** drug used mainly for pain relief during surgery (*see* **OPIATE**).

**alfuzosin** *n.* an **\*alpha blocker** commonly used in the treatment of men with **\*lower urinary tract symptoms** thought to be due to benign prostatic hyperplasia (*see* **PROSTATE GLAND**).

**ALG** antilymphocyte globulin. *See* **ANTILYMPHOCYTE SERUM**.

**algometer** *n.* a piece of equipment for determining the sensitivity of the skin to various touch stimuli, especially those causing pain.

**-algia** *combining form denoting pain.* Example: **neuralgia** (pain in a nerve).

**algid** *adj.* cold: usually describing the cold clammy skin associated with certain forms of malaria.

**alginates** *pl. n.* derivatives of **alginic acid**, a complex carbohydrate extracted from certain brown seaweeds, that readily absorb water to form a gel. Alginates are included in many **\*antacid** preparations (e.g. **Gaviscon**) for the relief of heartburn caused by **\*gastro-oesophageal reflux** because they form a layer on the stomach contents that protects the oesophagus from acid reflux. As they are highly absorbent, alginates are also used in dressings for exuding wounds.

**algodystrophy** *n.* a specific post-traumatic syndrome after nerve injury, in which a limb remains exquisitely sensitive to any stimulus and later develops disuse **\*atrophy**. See **COMPLEX REGIONAL PAIN SYNDROME**.

**alogliptin** *see* **DPP-IV INHIBITORS**.

**algorithm** *n.* a sequential set of instructions used in calculations or problem solving. A **reconstruction algorithm** is a complex mathematical formula used by a computer to construct images from the data acquired by CT, MRI, or other scanners. A **diagnostic algorithm** or a **therapeutic algorithm** consists of a stepwise series of instructions with branching pathways to be followed to assist a physician in coming to a diagnosis or deciding on a management strategy, respectively.

**alienation** *n.* **1.** a feeling of estrangement, important to overcome in communication with patients who are from different cultures or backgrounds from the clinician. **2.** (in psychiatry) *see* **THOUGHT ALIENATION**.

**alien limb syndrome** a rare neurological condition in which upper limb movements occur without an individual's awareness of or control over the actions. In extreme cases, a person will deliberately use their other arm to restrain the 'alien limb'. It is caused by damage to connections between the cerebral hemispheres or the frontal or occipital brain areas and can occur following stroke or in dementia.

**alimemazine** *n.* an **\*antihistamine** drug (a **\*phenothiazine** derivative) that also possesses sedative properties. It is mainly used in the treatment of pruritus (itching) and urticaria (nettle rash), but also for premedication. Common side-effects include drowsiness, dizziness, dryness of mouth, muscular tremor and incoordination, and confusion.

**alimentary canal** the long passage through which food passes to be digested and absorbed (see illustration). It extends from the mouth to the anus and each region is specialized for a different stage in the processing of food, from mechanical breakdown in the mouth to chemical **\*digestion** and **\*absorption** in the stomach and small intestine and finally to faeces formation and water absorption in the colon and rectum.

**The alimentary canal.**

**alitretinoin** *n.* see **RETINOID**.

**alizarin (alizarin carmine)** *n.* an orange-red dye derived from coal tar and originally isolated from the plant madder (*Rubia tinctorum*). Alizarin is insoluble in water but dissolves in alkalis, alcohol, and ether. It is used as a pH indicator and as a histochemical reagent for calcium, thallium, titanium, and zirconium.

**ALK** *see* **AUTOMATED LAMELLAR KERATECTOMY**.

**alkalaemia** *n.* abnormally high blood alkalinity. This may be caused by an increase in the concentration of alkaline substances and/or a decrease in that of acidic substances in the blood. *See also* **ALKALOSIS**. *Compare* **ACIDAEMIA**.

**alkaloid** *n.* one of a diverse group of nitrogen-containing substances that are produced by plants and have potent effects on body function. Many alkaloids are important drugs, including **\*morphine**, **\*quinine**, **\*atropine**, and **\*codeine**.

**alkalosis** *n.* a condition in which the alkalinity of body fluids and tissues is abnormally high. This arises because of a failure of the mechanisms that usually maintain a balance between alkalis and acids in the arterial blood (*see* **ACID-BASE BALANCE**). Alkalosis may be associated with loss of acid through vomiting or with excessive sodium bicarbonate intake. Breathing that is abnormally deep in relation to the amount of physical exercise may lead to **respiratory alkalosis**. Alkalosis may produce symptoms of muscular weakness or cramp.

**alkaptonuria** *n.* *see* **ALCAPTONURIA**.

**alkylating agents** a class of chemotherapy drugs that includes **\*cyclophosphamide**, **\*ifosfamide**, and **\*melphalan**. These drugs bind to DNA and prevent complete separation of the two DNA chains during cell division. Side-effects are those of other **\*cytotoxic drugs**; in addition, alkylating agents interfere with **\*gametogenesis** and may cause sterility in men.

**allantois** *n.* the membranous sac that develops as an outgrowth of the embryonic hindgut. Its outer (mesodermal) layer carries blood vessels to the **\*placenta** and so forms part of the **\*umbilical cord**. Its cavity is small and becomes reduced further in size during fetal development (*see* **URACHUS**).  
—**allantoic** *adj.*

**allele (allelomorph)** *n.* one of two or more alternative forms of a **\*gene**, only one of which can be present in a chromosome. Two alleles of a particular gene occupy the same relative positions on a pair of **\*homologous** chromosomes. If the two alleles are the same, the individual is **\*homozygous** for the gene; if they are different he is **\*heterozygous**. *See also* **DOMINANT**; **RECESSIVE**. —**allelic** *adj.*

**allelomorph** *n.* *see* **ALLELE**.

**allergen** *n.* any **\*antigen** that causes **\*allergy** in a hypersensitive person. Allergens are diverse and affect different tissues and organs. Pollens, fur, feathers, mould, and dust may cause hay fever; house-dust mites (*see* **DERMATOPHAGOIDES**) have been implicated in some forms of asthma; drugs, dyes, cosmetics, and a host of other chemicals can cause rashes and dermatitis; some food allergies may cause diarrhoea or constipation or simulate acute bacterial food poisoning. When a patient's allergen has been identified (*see* **PATCH TEST**), it may be possible to attempt **\*desensitization** to alleviate or prevent allergic attacks. —**allergenic** *adj.*

**allergy** *n.* a disorder in which the body becomes hypersensitive to particular antigens (called **\*allergens**), which provoke characteristic symptoms whenever they are subsequently inhaled, ingested, injected, or otherwise contacted. Normally antibodies in the bloodstream and tissues react with and destroy specific antigens without further trouble. In an allergic person, however, the allergens provoke the release of a class of antibodies (IgE) that become bound to **\*mast cells** in the body's tissues. The subsequent reaction of allergen with tissue-bound antibody (*see* **REAGIN**) also leads, as a side-effect, to cell damage, release of **\*histamine** and **\*serotonin** (5-hydroxytryptamine), inflammation, and all the symptoms of the particular allergy. Different allergies afflict different tissues and may have either local or general effects, varying from asthma and hay fever to severe dermatitis or gastroenteritis or extremely serious shock (*see* **ANAPHYLAXIS**). —**allergic** *adj.*

<https://www.allergyuk.org/>

- Website of Allergy UK: provides information on a wide range of allergies together with their diagnosis and treatment

**allied health professional** a health-care professional with expert knowledge and experience in certain fields but without a medical or nursing qualification. Allied health professionals include speech and language therapists, radiographers, physiotherapists, occupational therapists, and dieticians.

**alloantibody** *n.* see **ISOANTIBODY**.

**alloantigen** *n.* see **ISOANTIGEN**.

**allodynia** *n.* pain due to a stimulus that would not normally cause pain, such as a light touch or mild changes in temperature. It occurs acutely after injury but also in many chronically painful conditions, including **\*peripheral neuropathy**.

**allogeneic** *adj.* describing grafted tissue derived from a donor of the same species as the recipient.

**allograft (homograft)** *n.* a living tissue or organ graft between two members of the same species; for example, a heart transplant from one person to another. Such grafts will not survive unless the recipient is treated to suppress his body's **\*immune response** to the foreign tissue or the grafted organ is from an identical twin. *See also* **TRANSPLANTATION**.

**alloisoleucine** *n.* one of the isomers of the amino acid isoleucine.

**allopathy** *n.* (in homeopathic medicine) the orthodox system of medicine, in which the use of drugs is directed to producing effects in the body that will directly oppose and so alleviate the symptoms of a disease. *Compare* **HOMEOPATHY**.

**alloplasty** *n.* a surgical operation in which a synthetic material, such as stainless steel, replaces a body part or tissue.

**allopurinol** *n.* a drug used for the prevention of acute attacks of **\*gout** and of kidney stones. It acts by reducing the level of uric acid in tissues and blood. Side-effects include nausea, vomiting, diarrhoea, headache, fever, stomach

pains, and skin rashes. Occasionally, nerve damage and enlargement of the liver may occur.

**almotriptan** *n.* see **5HT<sub>1</sub> AGONIST**.

**alopecia (baldness)** *n.* absence of hair from areas where it normally grows. **Non-scarring alopecias** include male-pattern balding, which is familial, and **androgenetic alopecia** in women, in which the hair loss is associated with increasing age. Acute hair fall (**telogen effluvium**), in which much or all of the hair is shed but may start to regrow at once, may occur after pregnancy or a serious illness. **Alopecia areata** consists of bald patches that may regrow; it is an example of an organ-specific **\*autoimmune disease**. **Alopecia totalis** is loss of all the scalp hair, due to an autoimmune condition; in some 70% of cases it regrows within a few years. **Alopecia universalis** is loss of all body hair. In **scarring** (or **cicatricial**) **alopecias** the hair does not regrow; examples include **\*lichen planus** and discoid **\*lupus erythematosus**.

**alpha agonist** see **SYMPATHOMIMETIC**.

**alpha-1 antitrypsin deficiency** a rare inherited disorder associated with lung and liver diseases. It is caused by a deficiency of  $\alpha_1$ -antitrypsin, a plasma globulin whose role is to inhibit the action of various protease enzymes (including trypsin), which protect the lungs against the action of the enzyme neutrophil elastase. This results in degradation of the **\*elastin** of alveolar walls as well as structural proteins in other tissues, including the liver. Although many patients present in childhood, the disorder can occur in adults as well.

**alpha blocker (alpha-adrenergic blocker)** a drug that prevents the stimulation of alpha **\*adrenoceptors** at the nerve endings of the sympathetic nervous system by noradrenaline and adrenaline: it therefore causes relaxation of smooth muscle, including widening of arteries (vasodilatation) and a drop in blood pressure. Alpha blockers include **\*doxazosin**, **\*phentolamine**, **\*phenoxybenzamine**, **\*indoramin**, **\*prazosin**, **\*alfuzosin**, and **\*tamsulosin**.

**alpha-fetoprotein (AFP)** *n.* a protein that is formed in the liver and yolk sac of the fetus and is present in the fetal serum and secondarily in maternal blood. Maternal AFP is used as a marker in **\*prenatal screening** tests, which

can be performed between the 15th and 20th weeks of pregnancy. Levels are elevated in open *\*neural tube defects* (e.g. spina bifida), open abdominal wall defects (e.g. *\*gastroschisis*), fetal death, and multiple pregnancy. Levels of AFP are decreased in *\*Down's syndrome*. However, AFP levels are affected by the length of gestation and the mother's weight, and these factors must be considered when interpreting the results. When levels are unexpectedly high or low, further investigations (for example detailed *\*ultrasonography*) are indicated.

Alpha-fetoprotein is also produced by certain tumours, including malignant *\*teratomas* and primary liver tumours (*\*hepatomas*). See **TUMOUR MARKER**.

**alpha-glucosidase inhibitor** any member of a group of *\*oral hypoglycaemic drugs*, including **acarbose** (Glucobay), used for treating type 2 *\*diabetes mellitus*. They reduce the breakdown and absorption of carbohydrates in the intestine by blocking the action of an important enzyme ( $\alpha$ -glucosidase) in this process. Side-effects include flatulence and diarrhoea.

**alphavirus** *n.* any member of a genus of *\*arboviruses* transmitted by mosquitoes. Many alphaviruses can cause disease in humans and animals, including *\*O'nyong nyong fever* and *\*Ross River fever*.

**Alport's syndrome** a hereditary disease that causes *\*nephritis* accompanied by deafness and, less commonly, ocular defects, such as cataracts. Affected males usually develop end-stage renal failure and, unless treated with a kidney transplant, die before the age of 40. Females have a better prognosis. [A. C. Alport (1880–1959), South African physician]

**alprazolam** *n.* a *\*benzodiazepine* used for the short-term relief of anxiety. Side-effects include drowsiness and lightheadedness.

**alprostadil** *n.* a *\*prostaglandin* drug ( $\text{PGE}_1$ ) administered to improve lung blood flow in newborn babies with congenital heart defects who are awaiting surgery; it acts by preventing the closure of the blood vessel connecting the aorta to the pulmonary artery (*see* **DUCTUS ARTERIOSUS**). Possible side-effects include diminished respiratory efforts. Alprostadil is also administered to treat *\*erectile dysfunction* in men; it acts by relaxing smooth muscle and dilating the cavernosal arteries, so that blood is trapped

when the venules become compressed against the *\*tunica* albuginea. Side-effects may include dizziness and headache.

**ALS 1.** amyotrophic lateral sclerosis. *See* **MOTOR NEURON DISEASE**. **2.** *see* **ADVANCED LIFE SUPPORT**. **3.** *see* **ANTILYMPHOCYTE SERUM**.

**ALT 1.** *see* **ALANINE AMINOTRANSFERASE**. **2.** argon laser *\*trabeculoplasty*.

**alteplase** *n.* a *\*tissue-type plasminogen activator* made by recombinant DNA technology (genetic engineering). Alteplase is used to dissolve blood clots (*see* **FIBRINOLYTIC**) in the treatment of ischaemic stroke, myocardial infarction, and pulmonary embolism. Possible side-effects include local bleeding, cerebral haemorrhage, nausea, and vomiting.

**alternative medicine** *see* **COMPLEMENTARY MEDICINE**.

**altitude sickness (mountain sickness)** the condition that results from unaccustomed exposure to a high altitude (4500 m or more above sea level). Reduced atmospheric pressure and shortage of oxygen cause deep rapid breathing (*\*hyperventilation*), which lowers the concentration of carbon dioxide in the blood (*see* **ALKALOSIS**). Symptoms include nausea, exhaustion, and anxiety. In severe cases there may be acute shortness of breath due to fluid collecting in the lungs (pulmonary *\*oedema*), which requires treatment by diuretics and return to a lower altitude.

**altruistic donation** a type of organ donation where the donor offers an organ (often a kidney) for transplantation into a stranger. This may form a chain of organ donation to allow a suitable match for the donor's relative or partner if the pair are incompatible.

**aluminium chloride hexahydrate** a powerful antiperspirant used in the treatment of conditions associated with excessive sweating (*see* **HYPERHIDROSIS**).

**aluminium hydroxide** a safe slow-acting antacid. It is administered (often in combination with magnesium hydroxide) in the treatment of indigestion, gastric and duodenal ulcers, and reflux *\*oesophagitis*.

**alveolar osteitis** *see* **DRY SOCKET**.

**alveolitis** *n.* inflammation of an **\*alveolus** or alveoli. Chronic inflammation of the walls of the alveoli of the lungs is usually caused by inhaled organic dusts (**extrinsic allergic alveolitis**; *see* **BIRD-FANCIER'S LUNG**; **FARMER'S LUNG**) but may occur spontaneously (**cryptogenic fibrosing alveolitis**, **CFA**). CFA is now usually called **\*idiopathic pulmonary fibrosis** because the fibrosis seems to precede the alveolitis. It may be associated with connective tissue diseases, such as rheumatoid arthritis or systemic sclerosis.

**alveolus** *n.* (*pl.* **alveoli**) **1.** (in the **\*lung**) a blind-ended air sac of microscopic size. About 30 alveoli open out of each **alveolar duct**, which leads from a respiratory **\*bronchiole**. The **alveolar walls**, which separate alveoli, contain capillaries. The alveoli are lined by a single layer of **\*pneumocytes**, which thus form a very thin layer between air and blood so that exchange of oxygen and carbon dioxide is normally rapid and complete. Children are born with about 20 million alveoli. The adult number of about 300 million is reached around the age of eight. **2.** the part of the upper or lower jawbone that supports the roots of the teeth (*see also* **MANDIBLE**; **MAXILLA**). After tooth extraction it is largely absorbed. **3.** the sac of a **\*racemose** gland (*see also* **ACINUS**). **4.** any other small cavity, depression, or sac. —**alveolar** *adj.*

**alverine citrate** a bulking agent and **\*antispasmodic** drug used to treat irritable bowel syndrome and diverticular disease. Side-effects include occasional mild distension of the bowel.

**alveus** *n.* a cavity, groove, or canal. The **alveus hippocampi** is the bundle of nerve fibres in the brain forming a depression in which the hippocampus lies.

**Alzheimer's disease** the most common form of **\*dementia**, occurring in middle age or later. It is characterized by memory impairment and, as the disease progresses, language difficulties, **\*apraxia**, and visuospatial problems, leading to a loss of judgment and the inability to carry out even basic functions. At post mortem there are excess deposits of **\*amyloid** protein and **\*neurofibrillary tangles** in the brain. In rare cases of familial Alzheimer's, mutations in three genes have so far been detected; patients with these genes usually have early-onset dementia. The cause of the common sporadic form is not known although genetic factors can significantly increase the risk of developing the disease. Mutations in four other genes

have been implicated in the more common late-onset form of the disease. The demonstration of damage to the cholinergic pathways has led to the development of *\*acetylcholinesterase inhibitors*, which have been shown to slow disease progression. Ethical problems in the care of someone who has been used to making their own decisions (but now cannot) include respecting what *\*autonomy* remains, how to gain valid *\*consent* for treatment, and how to allow the patient proper *\*dignity*. [A. Alzheimer (1864–1915), German physician]

<https://www.alzheimers.org.uk/>

- Website of the Alzheimer's Society: includes resources for health and care professionals

**AMA** *see* **AMERICAN MEDICAL ASSOCIATION**.

**amalgam** *n.* an alloy of mercury, especially one used for dental fillings. Dental amalgam is a mixture of mercury with silver, tin, copper, and other trace metals. The components are mixed together in a machine known as an **amalgamator**.

**Amanita** *n.* a genus of fungi that contains several species of poisonous toadstools, including *A. phalloides* (death cap), *A. pantherina* (panther cap), and *A. muscaria* (fly agaric). They produce toxins that cause abdominal pain, violent vomiting, and continuous diarrhoea. In the absence of treatment death occurs in approximately 50% of cases, due to severe liver damage.

**amantadine** *n.* an antiviral drug that increases the activity of *\*dopamine* in the brain and is used mainly to treat Parkinson's disease. Common side-effects include nervousness, loss of muscular coordination, and insomnia.

**amaurosis** *n.* partial or complete blindness. For example, **amaurosis fugax** is a condition in which loss of vision is transient. *See also* **LEBER'S CONGENITAL AMAUROSIS**. —**amaurotic** *adj.*

**ambitendence** *n.* a psychiatric symptom occasionally seen in *\*schizophrenia* and *\*catatonia*: a state of ambivalence with alternation of cooperation and opposition. For instance, a patient may not know whether or not to shake the

interviewer's hand, constantly shifting between holding the hand out and withdrawing it.

**ambivalence** *n.* **1.** (in psychology) the condition of holding opposite feelings (such as love and hate) for the same person or object. This can cause relationship difficulties and pathological grief reactions. **2.** (in psychiatry) the condition of making varying decisions about a treatment plan without the ability to adhere to the decision agreed.

**Amblyomma** *n.* a genus of hard **\*ticks**, several species of which are responsible for transmitting tick **\*typhus**. The bite of this tick can also give rise to a serious and sometimes fatal paralysis.

**amblyopia** *n.* poor sight, not due to any detectable disease of the eyeball or visual system, known colloquially as **lazy eye**. In practice this strict definition is not always obeyed. For example, in **toxic amblyopia**, caused by tobacco, alcohol, certain other drugs, and vitamin deficiency, there is a disorder of the **\*optic nerve**. The commonest type is **amblyopia ex anopsia**, in which factors such as squint (*see* **STRABISMUS**), cataract, and other abnormalities of the optics of the eye (*see* **REFRACTION**) impair its normal use in early childhood by preventing the formation of a clear image on the retina. This in turn leads to a cortical visual impairment.

**amblyoscope (orthoptoscope, synoptophore)** *n.* an instrument for measuring the angle of a squint and assessing the degree to which a person uses both eyes together. It consists of two L-shaped tubes, the short arms of which are joined by a hinge so that the long arms point away from each other. The subject looks into the short end and each eye sees, via a system of mirrors and lenses, a different picture, which is placed at the other end of each tube. If a squint is present, the tubes may be adjusted so that the short arms line up with the direction of each eye.

**AMD** age-related **\*macular degeneration**.

**amelia** *n.* congenital total absence of the arms or legs due to a developmental defect. It is one of the fetal abnormalities induced by the drug **\*thalidomide** taken early in pregnancy. *See also* **PHOCOMELIA**.

**ameloblast** *n.* a cell that is only present during tooth development. Ameloblasts secrete and deposit tooth enamel and disappear completely before tooth eruption.

**ameloblastoma** *n.* an odontogenic tumour in the jaw. It invades the mandible more commonly than the maxilla and rarely exhibits malignant behaviour. It is considered to develop from ameloblasts although it does not contain enamel.

**amelogenesis** *n.* the formation of enamel by **\*ameloblasts**, a process that is completed before tooth eruption. **Amelogenesis imperfecta** is a hereditary condition in which enamel formation is disturbed. The teeth have an unusual surface but may not be more prone to decay.

**amenorrhoea** *n.* the absence or stopping of the menstrual periods. It is normal for the periods to be absent before puberty, during pregnancy and milk secretion, and after the end of the reproductive period (*see MENOPAUSE*). In **primary amenorrhoea** the menstrual periods fail to appear at puberty, due to absence of the uterus or ovaries, a genetic disorder (e.g. **\*Turner's syndrome**), or hormonal imbalance. It is diagnosed when **\*menarche** has not occurred by the age of 16½ years but there is normal development of secondary sexual characteristics or by the age of 14 years if secondary sexual characteristics are absent. In **secondary amenorrhoea** the menstrual periods stop after establishment at puberty for a minimum of six months. Causes include disorders of the hypothalamus (a part of the brain), deficiency of ovarian, pituitary, or thyroid hormones, mental disturbance, depression, anorexia nervosa, or a major change of surroundings or circumstances.

**American Medical Association (AMA)** a professional organization for US physicians. Its purposes include dissemination of scientific information through journals, a weekly newspaper, and a website; representation of the profession to Congress and state legislatures; keeping members informed of pending health and medical legislation; evaluating prescription and non-prescription drugs; and cooperating with other organizations in setting standards for hospitals and medical schools. The AMA maintains a comprehensive directory of licensed physicians in the US.

**amethocaine** *n.* *see* **TETRACAINE**.

**ametropia** *n.* any abnormality of **\*refraction** of the eye, resulting in blurring of the image formed on the retina. See **ASTIGMATISM**; **HYPERMETROPIA**; **MYOPIA**. Compare **EMMETROPIA**.

**amfebutamone** *n.* see **BUPROPION**.

**amiloride** *n.* a potassium-sparing **\*diuretic** that causes the increased excretion of sodium and chloride; it is often combined with a thiazide or loop diuretic (e.g. hydrochlorothiazide as **co-amilozide**) to reduce the potassium loss that occurs with these drugs. Amiloride may produce dizziness and weakness and its continued use may lead to an excessive concentration of potassium in the blood.

**amino acid** an organic compound containing an amino group ( $-\text{NH}_2$ ) and a carboxyl group ( $-\text{COOH}$ ). Amino acids are fundamental constituents of all **\*proteins**. They are classified as **\*essential** amino acids, i.e. those that cannot be synthesized by the body, and nonessential amino acids, which can be synthesized by the body. Certain amino acids present in the body are not found in proteins; these include **\*citrulline**, **\*ornithine**, **\*taurine**, and **\*gamma-aminobutyric acid**.

**aminoacidopathy** *n.* see **MAPLE SYRUP URINE DISEASE**; **METHYLMALONIC ACIDURIA**.

**aminoglycosides** *pl. n.* a group of antibiotics active against a wide range of bacteria. It includes **\*gentamicin**, **\*neomycin**, and **\*streptomycin**. Because of their toxicity (side-effects include ear and kidney damage), these drugs are used only when less toxic antibacterials are ineffective or contraindicated.

**aminopeptidase** *n.* any one of several enzymes in the intestine that cause the breakdown of a **\*peptide**, removing an amino acid.

**aminophylline** *n.* a drug that relaxes smooth muscle and stimulates respiration. It is widely used to dilate the air passages in the treatment of severe asthma and some cases of chronic obstructive pulmonary disease. Side effects may include nausea, vomiting, dizziness, and fast heart rate. See also **THEOPHYLLINE**.

**aminosalicylates** *pl. n.* drugs containing 5-aminosalicylic acid, used to treat ulcerative colitis (and to maintain patients in remission from it) and Crohn's disease affecting the colon. They include **\*sulfasalazine**, **\*olsalazine**, and **mesalazine**.

**amiodarone** *n.* an **\*anti-arrhythmic** drug used to control a variety of abnormal heart rhythms, including atrial **\*fibrillation** and abnormally rapid heartbeat. Side-effects can include harmless deposits in the cornea, photosensitivity, and peripheral neuropathy.

**amisulpride** *n.* *see* **ANTIPSYCHOTIC**.

**amitosis** *n.* division of the nucleus of a cell by a process, not involving **\*mitosis**, in which the nucleus is constricted into two.

**amitriptyline** *n.* a tricyclic **\*antidepressant** drug that has a mild tranquillizing action. Side-effects can include abnormal heart rhythms, which may be fatal following overdose, and the drug is now rarely used for depression; it may be used to treat chronic pain.

**amlodipine** *n.* a **\*calcium-channel blocker** used to treat hypertension and prevent angina pectoris. Possible side-effects include headache, dizziness, fatigue, nausea, and fluid retention.

**amnesia** *n.* total or partial loss of memory following physical injury, disease, drugs, or psychological trauma (*see* **CONFABULATION**; **FUGUE**; **REPRESSION**). **Anterograde amnesia** is loss of memory for the events following a trauma; **retrograde amnesia** is loss of memory for events preceding the trauma. Some patients experience both types.

**amnesic MCI** *see* **MILD COGNITIVE IMPAIRMENT**.

**amnihook** *n.* a small plastic hooked instrument for performing **\*amniotomy**. The hook is introduced through the cervix.

**amniocentesis** *n.* withdrawal of a sample of the fluid (**\*amniotic fluid**) surrounding a fetus in the uterus by piercing the amniotic sac through the abdominal wall, under direct ultrasound guidance. As the amniotic fluid contains cells from the fetus (mostly shed from the skin), cell cultures enable chromosome patterns to be studied so that **\*prenatal diagnosis** of

chromosomal abnormalities (such as *\*Down's syndrome*) can be made. Certain metabolic errors and other abnormalities, such as *\*spina bifida*, can also be diagnosed prenatally from analysis of the cells or of the fluid. Amniocentesis is usually performed at any time from the 15th completed week of gestation; it carries a 1–2% risk of miscarriage.

**amnion** *n.* the membrane that forms initially over the dorsal part of the embryo but soon expands to enclose it completely within the *\*amniotic cavity*; it is connected to the embryo at the umbilical cord. It expands outwards and fuses with the chorion, obliterating virtually all the intervening cavity. The double membrane (**amniochorion**) normally ruptures at birth. — **amniotic** *adj.*

**amnioreduction** *n.* the removal of amniotic fluid in greater amounts than required for amniocentesis for therapeutic reasons (e.g. *\*twin-to-twin transfusion syndrome*, *\*polyhydramnios*).

**amniotic cavity** the fluid-filled cavity between the embryo and the *\*amnion*. It forms initially within the inner cell mass of the *\*blastocyst* and later expands over the back of the embryo, eventually enclosing it completely. *See also* AMNIOTIC FLUID.

**amniotic fluid** the fluid contained within the *\*amniotic cavity*. It surrounds the growing fetus, protecting it from external pressure. The fluid is initially secreted from the *\*amnion* and is later supplemented by urine from the fetal kidneys. Some of the fluid is swallowed by the fetus and absorbed through its intestine. The volume of amniotic fluid varies according to the stage of gestation: approximate normal values are 500 ml at 18 weeks, rising to a maximum of 800 ml at 34 weeks and falling to 600 ml at term. *See also* ANHYDRAMNIOS; OLIGOHYDRAMNIOS; POLYHYDRAMNIOS.

**amniotic fluid embolism** a condition in which amniotic fluid enters the maternal circulation causing a complex cascade similar to that seen in anaphylactic and septic *\*shock*. It is a rare event (1 in 50,000–100,000 deliveries), with a 60–80% maternal mortality. The sudden onset of cardiopulmonary collapse, together with coma or seizures, in labour or shortly after delivery, should prompt the diagnosis. Most of the women who survive have permanent neurological damage.

**amniotomy (artificial rupture of membranes, ARM)** *n.* a method of surgically inducing labour by puncturing the *\*amnion* surrounding the baby in the uterus using an *\*amnihook* or similar instrument.

**amobarbital (amylobarbitone)** *n.* an intermediate-acting *\*barbiturate* used to treat severe insomnia in patients already taking barbiturates.

**amoeba** *n.* (*pl.* **amoebae**) any protozoan of jelly-like consistency and irregular and constantly changing shape. Found in water, soil and other damp environments, they move and feed by means of flowing extensions of the body (*see* *PSEUDOPodium*). Some amoebae cause disease in humans (*see* *ACANTHAMOEBA*; *ENTAMOEBA*). —**amoebic** *adj.*

**amoebiasis** *n.* *see* *DYSENTERY*.

**amoebocyte** *n.* a cell that moves by sending out processes of its protoplasm in the same way as an amoeba.

**amoeboma** *n.* a rare manifestation of chronic or partially treated amoebic *\*dysentery* leading to the development of a nonmalignant inflammatory mass in the bowel. It can occur in the caecum, appendix, and *\*rectosigmoid* area in descending order of frequency. Amoebomas can cause symptoms of *\*intestinal obstruction*, weight loss, and low-grade fever. Colonic amoeboma with multiple amoebic liver abscesses can masquerade as colorectal carcinoma and liver metastases; imaging with ultrasound and CT scan is used to differentiate between these.

**amok** *n.* a sudden outburst of furious and murderous aggression, directed indiscriminately at everybody in the vicinity.

**amorolfine** *n.* an antifungal drug used to treat fungal infections of the skin and nails. Possible side-effects include itching and a transient burning sensation.

**amoxicillin** *n.* a semisynthetic *\*penicillin* used to treat infections caused by a wide range of bacteria and other microorganisms (*see also* *BETA-LACTAM ANTIBIOTIC*). Side-effects include nausea, vomiting, diarrhoea, rashes, and anaemia. Sensitivity to penicillin prohibits its use.

**AMP (adenosine monophosphate)** a compound containing adenine, ribose, and one phosphate group. AMP occurs in cells and is involved in processes

requiring the transfer of energy (see [ATP](#)).

**ampere** *n.* the basic [\\*SI unit](#) of electric current. It is equal to the current flowing through a conductor of resistance 1 ohm when a potential difference of 1 volt is applied between its ends. The formal definition of the ampere is the current that when passed through two parallel conductors of infinite length and negligible cross section, placed 1 metre apart in a vacuum, produces a force of  $2 \times 10^{-7}$  newton per metre between them. Symbol: A.

**amphetamines** *pl. n.* a group of [\\*sympathomimetic](#) drugs that have a marked [\\*stimulant](#) action on the central nervous system, alleviating fatigue and producing a feeling of mental alertness and wellbeing. **Dexamfetamine** (**dexamphetamine**) is used in the treatment of [\\*narcolepsy](#) and in selected cases of [\\*attention-deficit/hyperactivity disorder](#) in children. Side-effects include insomnia and restlessness. [\\*Tolerance](#) to amphetamines develops rapidly, and prolonged use may lead to [\\*dependence](#); these drugs should not be used to treat depressive illness or obesity.

**amphiarthrosis** *n.* a slightly movable joint in which the bony surfaces are separated by fibrocartilage (see [SYMPHYSIS](#)) or hyaline cartilage (see [SYNCHONDROSIS](#)).

**amphoric breath sounds** see [BREATH SOUNDS](#).

**amphotericin** *n.* an [\\*antifungal](#) drug that is used to treat deep-seated fungal infections. Common side-effects include headache, fever, muscle pains, and diarrhoea; more severe side-effects, such as kidney damage, can be reduced if the drug is administered in a lipid preparation (see [LIPOSOME](#)).

**ampicillin** *n.* a semisynthetic [\\*penicillin](#) used to treat a variety of infections, including those of the urinary, respiratory, biliary, and intestinal tracts. It is inactivated by [\\*penicillinase](#) and therefore cannot be used against organisms producing this enzyme. Side-effects include nausea, vomiting, and diarrhoea, and some allergic reactions may occur.

**ampoule (ampule)** *n.* a sealed glass or plastic capsule containing one dose of a drug in the form of a sterile solution for injection.

**ampulla** *n.* (*pl.* **ampullae**) an enlarged or dilated ending of a tube or canal. The semicircular canals of the inner ear are expanded into ampullae at the

point where they join the vestibule. The **ampulla of Vater** is the dilated part of the common bile duct where it is joined by the pancreatic duct.

**amputation** *n.* the removal of a limb, part of a limb, or any other portion of the body (such as a breast or the rectum). The term is customarily modified by an adjective showing the particular type of amputation. Examples include above-knee, through-knee, and below-knee amputations of the lower limb. Limb amputation may be performed for gangrene or severe infections precipitated by conditions such as severe peripheral vascular disease or diabetes mellitus, where other techniques are not possible. It is also performed in cases of severe limb injury. In planning an amputation the surgeon takes account of the blood supply, the patient's mobility, and the type of artificial part (prosthesis) that will be fitted. It is not uncommon for patients to continue to have physical sensations in the body part that has been removed (\*phantom limb).

**Amsler grid** a chart usually consisting of a grid of black lines on a white background. It is used to detect and monitor problems of central vision affecting the retina; for example, in early macular disease, the square edges of the grid may appear distorted. [M. Amsler (1891–1968), Swiss ophthalmologist]

**amygdala (amygdaloid nucleus)** *n.* one of the \*basal ganglia and part of the \*limbic system: a roughly almond-shaped mass of grey matter deep inside each cerebral hemisphere. It has extensive connections with the olfactory system and sends nerve fibres to the hypothalamus; its functions are concerned with perception of threat, fear, learning, emotion, and memory.

**amylase** *n.* an enzyme that occurs in saliva and pancreatic juice and aids the digestion of starch, which it breaks down into glucose, maltose, and dextrins. Amylase will also hydrolyse \*glycogen to yield glucose, maltose, and dextrins.

**amylobarbitone** *n.* see AMOBARBITAL.

**amyloid** *n.* a \*glycoprotein, resembling starch, that is deposited in the internal organs in amyloidosis.  $\beta$ -amyloid protein has been found in the brains of Alzheimer's patients but the significance of this is unclear.

**amyloidosis** *n.* infiltration of the liver, kidneys, spleen, and other tissues with amyloid, a starchlike substance. In **primary amyloidosis** the disorder arises without any apparent cause; **secondary amyloidosis** occurs as a late complication of such chronic infections as tuberculosis or leprosy and also in **\*Hodgkin's disease**. Amyloidosis is also very common in the genetic disease familial Mediterranean fever (*see* **POLYSEROSITIS**).

**amylopectin** *n.* *see* **STARCH**.

**amylose** *n.* *see* **STARCH**.

**amyotonia congenita (floppy baby syndrome)** a former diagnosis for various conditions, present at birth, in which the baby's muscles are weak and floppy (i.e. hypotonic). The term is becoming obsolete as more specific diagnoses are discovered to explain the cause of floppiness in babies.

**amyotrophy** *n.* a progressive loss of muscle bulk (wasting) associated with weakness of these muscles. It is caused by disease of the motor nerve that activates the affected muscle. Amyotrophy is a feature of any chronic **\*neuropathy** and it may be found in some diabetic patients (*see* **DIABETIC AMYOTROPHY**). A combination of amyotrophy and spasticity may be found in the different forms of **\*motor neuron disease**.

**an-** *prefix.* *see* **A-**.

**ANA** *see* **ANTINUCLEAR ANTIBODY**.

**anabolic** *adj.* promoting tissue growth by increasing the metabolic processes involved in protein synthesis. Anabolic steroids are synthetic forms of male sex hormones (*see* **ANDROGEN**); they include **\*nandrolone**. They were formerly used to help weight gain in underweight patients, such as the elderly and those with serious illnesses, but are now used mainly to stimulate the production of blood cells by the bone marrow in some forms of aplastic anaemia. Some anabolic steroids cause virilization in women and liver damage.

**anabolism** *n.* the synthesis of complex molecules, such as proteins and fats, from simpler ones by living things. *See also* **ANABOLIC**; **METABOLISM**.

**anacidity** *n.* a deficiency or abnormal absence of acid in the body fluids.

**anacrotism** *n.* the condition in which there is an abnormal curve in the ascending line of a pulse tracing. It may be seen in cases of aortic stenosis. —**anacrotic** *adj.*

**anaemia** *n.* a reduction in the quantity of the oxygen-carrying pigment **\*haemoglobin** in the blood. The main symptoms are excessive tiredness and fatigability, breathlessness on exertion, pallor, and poor resistance to infection.

There are many causes of anaemia. It may be due to loss of blood (**haemorrhagic anaemia**), resulting from an accident, operation, etc., or from chronic bleeding, as from an ulcer or haemorrhoids. **Iron-deficiency anaemia** results from lack of iron, which is necessary for the production of haemoglobin (*see* **SIDEROPENIA**). **Haemolytic anaemias** result from the increased destruction of red blood cells (which contain the pigment). This can be caused by toxic chemicals; **\*autoimmunity**; the action of parasites, especially in **\*malaria**; or conditions such as **\*thalassaemia** and **\*sickle-cell disease**, associated with abnormal forms of haemoglobin, or **\*spherocytosis**, which is associated with abnormal red blood cells. (*See also* **HAEMOLYTIC DISEASE OF THE NEWBORN**.) Anaemia can also be caused by the impaired production of red blood cells, as in **\*leukaemia** (when red-cell production in the bone marrow is suppressed) or **\*pernicious anaemia**. **Aplastic anaemia** is characterized by a failure of blood cell production resulting in **\*pancytopenia** and reduced bone marrow cellularity.

Anaemias can be classified on the basis of the size of the red cells, which may be large (**macrocytic anaemias**), small (**microcytic anaemias**), or normal-sized (**normocytic anaemias**). (*See also* **MACROCYTOSIS**; **MICROCYTOSIS**.) The treatment of anaemia depends on the cause. — **anaemic** *adj.*

**anaerobe** *n.* any organism, especially a microbe, that is able to live and grow in the absence of free oxygen. A **facultative anaerobe** is a microorganism that grows best in the presence of oxygen but is capable of some growth in its absence. An **obligate anaerobe** can grow only in the absence of free oxygen. *Compare* **AEROBE**; **MICROAEROPHILIC**.

**anaerobic** *adj.* **1.** of or relating to anaerobes. **2.** describing a type of cellular respiration in which foodstuffs (usually carbohydrates) are never completely oxidized because molecular oxygen is not used. \*Fermentation is an example of anaerobic respiration.

**anaesthesia** *n.* loss of feeling or sensation in a part or all of the body. Anaesthesia of a part of the body may occur as a result of injury to or disease of a nerve; for example in trauma. The term is usually applied, however, to the technique of reducing or abolishing an individual's sensation of pain to enable surgery to be performed. This is effected by administering drugs (*see* ANAESTHETIC).

**General anaesthesia** is total unconsciousness, usually achieved by administering a combination of injections and gases (the latter are inhaled through a mask). **Local anaesthesia** abolishes pain in a limited area of the body and is used for minor operations, particularly many dental procedures. It may be achieved by injections of substances such as lidocaine close to a local nerve, which deadens the tissues supplied by that nerve. Local anaesthesia may be combined with intravenous sedation. An appropriate injection into the spinal column produces \*spinal anaesthesia or \*epidural anaesthesia in the lower limbs or abdomen. **Regional anaesthesia**, usually of a limb, is achieved by encircling local anaesthetic solutions or direct application of anaesthetic to one or more peripheral nerves.

**anaesthetic** **1.** *n.* an agent that reduces or abolishes sensation, affecting either the whole body (**general anaesthetic**) or a particular area or region (**local anaesthetic**). General anaesthetics, used for surgical procedures, depress activity of the central nervous system, producing loss of consciousness. \*Anaesthesia is induced by intravenous anaesthetics, such as \*thiopental, etomidate, or propofol, and maintained by inhalation anaesthetics (such as \*sevoflurane). Local anaesthetics inhibit conduction of impulses in sensory nerves in the region where they are injected or applied; they include \*tetracaine, \*bupivacaine, and \*lidocaine. **2.** *adj.* reducing or abolishing sensation.

**anaesthetist** *n.* a medically qualified doctor who administers an anaesthetic to induce unconsciousness in a patient before a surgical operation.

**anagen** *n.* the growth phase of a hair follicle, lasting two to three years. It is followed by a transitional stage, called **catagen**, which lasts for about two weeks, and then a resting phase, **telogen**. On average about 85% of hairs are in anagen and hence growing actively. There are about 100,000 hairs on the human scalp and up to 100 may be shed each day.

**anákhre** *n.* see **GOUNDOU**.

**anakinra** *n.* a **\*biological therapy** that inhibits **\*interleukin 1**, an inflammatory **\*cytokine** involved in the pathogenesis of rheumatoid arthritis. It reduces long-term cartilage and joint damage and is self-administered subcutaneously on a daily basis. Risk of infection and allergy, including mild injection-site reactions, may occur and last several weeks.

**anal** *adj.* of, relating to, or affecting the anus; for example an anal **\*fissure** or an anal **\*fistula**.

**anal canal** the terminal portion of the large intestine, which is surrounded by the muscles of defecation (**anal sphincters**). The canal ends on the surface at the anal orifice (see **ANUS**).

**analeptic (respiratory stimulant)** *n.* a drug that acts on the central nervous system to stimulate the muscles involved in breathing. Analeptics, such as **\*doxapram**, are used to treat respiratory depression and respiratory failure.

**anal fissure** a break or rent of the mucosa of the anal canal, which commonly presents with anal pain during and immediately following defecation and the passage of bright red blood in the stools. Anal fissures may occur secondary to constipation and having to forcefully strain during the process of defecation or as a consequence of prolonged episodes of diarrhoea. Over time an anal fissure may fail to heal, leading to the development of a chronic fissure that is prone to perianal infection. Medical treatment includes stool softeners and topical smooth muscle relaxants (such as 2% diltiazem cream). Surgery for anal fissures refractory to medical treatment includes **lateral sphincterotomy** (cutting the muscle of the anal sphincter).

**analgesia** *n.* reduced sensibility to pain, without loss of consciousness and without the sense of touch necessarily being affected. The condition may arise accidentally, if nerves are diseased or damaged, or be induced

deliberately by the use of pain-killing drugs (*see* [ANALGESIC](#)). Strictly speaking, local [\\*anaesthesia](#) should be called **local analgesia**. *See also* [RELATIVE ANALGESIA](#).

**analgesic** **1.** *n.* a drug that relieves pain. **Nonopioid analgesics**, such as [\\*aspirin](#) and [\\*paracetamol](#), are used for the relief of headache, toothache, and mild rheumatic pain. More potent **opioid analgesics**, such as [\\*morphine](#), [\\*pethidine](#), [\\*alfentanil](#), and [\\*buprenorphine](#), are used to relieve moderate or severe pain; these drugs may produce [\\*dependence](#) and [\\*tolerance](#) (*see* [OPIATE](#)). Some analgesics, including aspirin and [\\*indometacin](#), also reduce fever and inflammation and are used in rheumatic and other inflammatory conditions (*see* [NSAID](#)). **2.** *adj.* relieving pain.

**analgesic nephropathy** *n.* disease of the [\\*tubulointerstitium](#) of the kidney associated with chronic use of mixed analgesic preparations. Phenacetin, paracetamol, and salicylates have all been implicated. The condition is progressive and results in bilateral atrophy of the kidneys and chronic renal failure. In the early stages the condition is asymptomatic. The earliest clinical manifestations relate to disordered tubular function with impaired concentration and acidification of the urine.

**anal incontinence** *see* [INCONTINENCE](#).

**analogous** *adj.* **1.** describing organs or parts that have similar functions in different organisms although they do not have the same evolutionary origin or development. *Compare* [HOMOLOGOUS](#) **2.** (in ethics) describing a case, justification, or argument that is similar to the case in question and so may be used to help to reach a conclusion. *See also* [ANALYSIS](#); [CASUISTRY](#).

**analogue** *n.* a drug that differs in minor ways in molecular structure from its parent compound. Examples are [\\*calcipotriol](#) (an analogue of vitamin D), [\\*betahistine](#) (an analogue of histamine), and the [\\*gonadorelin analogues](#). Useful analogues of existing drugs are either more potent or cause fewer side-effects. [\\*Carboplatin](#) and [\\*oxaliplatin](#), for example, are less toxic analogues of [\\*cisplatin](#).

**analogue image** a traditional X-ray image on film that is in shades that range smoothly from black to white with no appreciable steps from one shade of

grey to the next (see [GREY SCALE](#)). Analogue images can be converted to digital format (see [DIGITIZATION](#)) for manipulation and storage by computers and other electronic devices.

**anal sphincter tears** see [PERINEAL TEAR](#); [OBSTETRIC ANAL SPHINCTER INJURY](#).

**analysis** *n.* **1.** (in psychology) any means of understanding complex mental processes or experiences. There are several systems of analysis used by different schools of psychology; for example, [\\*psychoanalysis](#); **transactional analysis**, in which people's relationships are explained in psychoanalytic terms; and **functional analysis**, in which a particular kind of behaviour is thoroughly described with reference to its frequency, its antecedents, and its consequences. **2.** (in ethics) the process of assessing the different moral and medical justifications or arguments for particular approaches to a problem. These need to be weighed up in order to reach an appropriate conclusion.

**anamnesis** *n.* a medical, psychiatric, or dental history before the onset of the condition being investigated, based on the patient's personal account.

**anankastic** *adj.* describing a collection of longstanding personality traits in ICD-10 (see [INTERNATIONAL CLASSIFICATION OF DISEASES](#)), including stubbornness, meanness, an over-meticulous concern to be accurate in small details, a disposition to check things unnecessarily, severe feelings of insecurity about personal worth, and an excessive tendency to doubt evident facts. These traits, sometimes described as **obsessional traits**, can amount to a [\\*personality disorder](#) if they are severe.

**anaphase** *n.* the third stage of [\\*mitosis](#) and of each division of [\\*meiosis](#). In mitosis and anaphase II of meiosis the chromatids separate, becoming daughter chromosomes, and move apart along the spindle fibres towards opposite ends of the cell. In anaphase I of meiosis the pairs of homologous chromosomes separate from each other. See [DISJUNCTION](#).

**anaphylaxis** *n.* an emergency condition resulting from an abnormal and immediate allergic response to a substance to which the body has become intensely sensitized. It results in flushing, itching, nausea and vomiting, swelling of the mouth and tongue and airway enough to often cause

obstruction, wheezing, a sudden drop in blood pressure, and even sudden death. In this extreme form it is called **anaphylactic shock**. Common causes are peanuts, latex, and wasp or bee stings. Treatment, which must be given immediately, consists of adrenaline (epinephrine) injection, oxygen with possible advanced support of the airway, intravenous fluids, intravenous corticosteroids, and antihistamines. —**anaphylactic** *adj.*

**anaplasia** *n.* a loss of normal cell characteristics or differentiation, which may be to such a degree that it is impossible to define the origin of the cells. Anaplasia is typical of rapidly growing malignant tumours, which are described as **anaplastic**.

**anasarca** *n.* massive swelling of the legs, trunk, and genitalia due to retention of fluid (**\*oedema**): found in congestive heart failure and some forms of renal failure.

**anastomosis** *n.* **1.** (in anatomy) a communication between two blood vessels without an intervening capillary network. *See* **ARTERIOVENOUS ANASTOMOSIS**. **2.** (in surgery) the surgical joining of two hollow organs, such as different parts of the intestines or blood vessels, in order to bypass disease or resected tissue and to restore continuity of the affected organ. *See also* **SHUNT**.

**anastrozole** *n.* *see* **AROMATASE INHIBITOR**.

**anatomical position** the internationally accepted body position for anatomical descriptions, such that any part of the body can be related to any other part of it. A person in the anatomical position stands erect, the arms hanging by the sides with the palms facing frontwards and the legs and feet together with the toes pointing forwards (see illustration overleaf).

**The anatomical position.**

**anatomical snuffbox** the triangular area on the most radial and distal aspect of the wrist overlying the **\*scaphoid bone** and bounded by the extensor tendons of the thumb. It is often tender in injuries to the scaphoid (*see SCAPHOID FRACTURE*).

**anatomy** *n.* the study of the structure of living organisms. In medicine it refers to the study of the form and gross structure of the various parts of the human body. The term **morphology** is sometimes used synonymously with anatomy but it is usually used for **comparative anatomy**: the study of

differences in form between species. *See also* [CYTOLOGY](#); [HISTOLOGY](#); [PHYSIOLOGY](#). —**anatomical** *adj.* —**anatomist** *n.*

**anatoxin** *n.* a former name for [\\*toxoid](#).

**ANCA** antineutrophil cytoplasmic antibodies: autoantibodies associated with various vasculitic syndromes, including [\\*granulomatosis with polyangiitis](#), [\\*microscopic polyangiitis](#), and [\\*Churg–Strauss syndrome](#). ANCA have long been suspected of having a pathogenic role.

**anconeus** *n.* a muscle behind the elbow that assists in extending the forearm.

**Ancylostoma (Ankylostoma)** *n.* a genus of small parasitic nematodes (*see* [HOOKWORM](#)) that inhabit the small intestine and are widely distributed in Europe, America, Asia, and Africa. The worms suck blood from the gut wall, to which they are attached by means of cutting teeth. Humans are the principal and optimum hosts for *A. duodenale*.

**ancylostomiasis** *n.* an infestation of the small intestine by the parasitic hookworm *Ancylostoma duodenale*. *See* [HOOKWORM DISEASE](#).

**Anderson–Fabry disease** *see* [FABRY DISEASE](#).

**ANDI** an acronym for *abnormal development and involution*, used to tabulate benign disorders of the breast.

**andr- (andro-)** *combining form denoting* men or the male sex. Example: **androphobia** (morbid fear of).

**androblastoma (arrhenoblastoma)** *n.* a rare tumour of the ovary, composed of Sertoli cells, Leydig cells, or both. It can produce male or female hormones and may give rise to [\\*masculinization](#); in children it may cause precocious puberty. Up to 30% of these tumours are malignant, but probably as many as 85% of all cases are cured by surgery alone.

**androgen** *n.* one of a group of steroid hormones, including [\\*testosterone](#) and [\\*dihydrotestosterone](#), that stimulate the development of male sex organs and male secondary sexual characteristics (e.g. beard growth, deepening of the voice, and muscle development). The principal source of these hormones is the testis (production being stimulated by [\\*luteinizing hormone](#)) but they are

also secreted by the adrenal cortex (see [DEHYDROEPIANDROSTERONE](#)) and ovaries in small amounts. In women excessive production of androgens gives rise to [\\*masculinization](#).

Naturally occurring and synthetic androgens are used in replacement therapy (to treat such conditions as delayed puberty in adolescent boys, [\\*hypogonadism](#), and impotence due to testicular insufficiency) and as [\\*anabolic](#) agents. Side-effects include salt and water retention, increased bone growth, and masculinization in women. Androgens should not be used in patients with cancer of the prostate gland or in pregnant women. — **androgenic** *adj.*

**androgen insensitivity syndrome (AIS)** an X-linked (see [SEX-LINKED](#)) disorder in which the body does not react to androgens because of structural abnormalities in androgen receptors. In its most extreme form, **complete AIS** (formerly known as **testicular feminization syndrome**), there is a fully female body appearance with breast development and a short vagina (but no uterus; testes are present internally). Psychosexuality is female orientated. **Partial AIS** is also known as [\\*Reifenstein's syndrome](#).

**androgenization** *n.* the final effects of the exposure of sensitive tissues to androgens, i.e. the development of secondary male sexual characteristics. Androgenization can also occur abnormally in females, who may develop excessive body hair, male-pattern baldness, and [\\*clitoromegaly](#).

**andrology** *n.* **1.** the study of male infertility and erectile dysfunction. [\\*Seminal analysis](#) reveals the presence of gross abnormalities in the shape and motility of spermatozoa, as well as their concentration in the semen, but further procedures are required to diagnose the underlying causes of the sperm dysfunction. These include the diagnosis of abnormalities in the genital tract (e.g. varicocele, obstruction of the vas deferens), which may be corrected surgically, and testing for the presence of antisperm antibodies in the semen and for the ability of the sperm to penetrate the cervical mucus, as well as for the presence of hormonal disorders. More sophisticated techniques include computer-assisted quantitative motility measurements, which monitor the precise speed and motility patterns of individual sperm; biochemical tests for the production of free oxygen radicals, which cause damage to developing sperm; and [\\*acrosome](#)-reaction assays, which reveal the ability of the sperm to penetrate the barriers surrounding the ovum. The

development of all these techniques has enabled the identification of several previously undiagnosed causes of infertility and the selection of treatments most likely to succeed in remedying them. **2.** the study of androgen production and the relationship of plasma androgen to androgen action. This study is necessary to understand *\*hirsutism* and other conditions caused by abnormal androgen production.

**andropause** *n.* the decline in production of testosterone that occurs with age in men. Unlike the female menopause, there is no circumscribed time at which testosterone production irreversibly ceases. Instead it tends to undergo a steady reduction from the third decade onwards.

**androstenedione** *n.* *see* **ADRENARCHE**; **DEHYDROEPIANDROSTERONE**; **TESTOSTERONE**.

**androsterone** *n.* a steroid that is formed in the liver as a metabolite of testosterone. *See also* **ANDROGEN**.

**anencephaly** *n.* partial or complete absence of the bones of the rear of the skull, the meninges, and the cerebral hemispheres of the brain. It occurs as a developmental defect, and most affected infants are stillborn; if born live they do not survive for more than a few hours. Anencephaly is often associated with other defects of the nervous system, such as *\*spina bifida*. Prenatal screening tests for anencephaly include detection of alpha-fetoprotein levels and ultrasound scanning.

**anergy** *n.* **1.** lack of response to a specific antigen or allergen. **2.** lack of energy. —**anergic** *adj.*

**aneuploidy** *n.* the condition in which the chromosome number of a cell is not an exact multiple of the normal basic (haploid) number. *See* **MONOSOMY**; **TRISOMY**. *Compare* **EUPLOIDY**. —**aneuploid** *adj., n.*

**aneurine** *n.* *see* **VITAMIN B<sub>1</sub>**.

**aneurysm** *n.* an abnormal balloon-like swelling in the wall of an artery. This may be due to degenerative disease or infection, which damages the muscular coats of the vessel, or it may be the result of congenital deficiency in the muscular wall. An **aortic aneurysm** most frequently occurs in the abdominal

aorta, below the level of the renal arteries. Beyond a certain size it is prone to rupture, presenting as an acute surgical emergency with abdominal and back pain and haemorrhagic shock. A **dissecting aneurysm** usually affects the thoracic aorta and results from a degenerative condition of its muscular coat. This weakness predisposes to a tear in the lining of the aorta, which allows blood to enter the wall and track along (dissect) the muscular coat. A dissecting aneurysm may rupture or it may compress the blood vessels arising from the aorta and produce infarction (localized necrosis) in the organs they supply. The patient complains of severe chest pain that has a tearing quality and often spreads to the back, shoulder, or abdomen. Emergency surgical repair is indicated (see [ENDOVASCULAR ANEURYSM REPAIR](#)). A **ventricular aneurysm** may develop in the wall of the left ventricle after myocardial infarction. A segment of myocardium becomes replaced by scar tissue, which expands to form an aneurysmal sac. Heart failure may result or thrombosis within the aneurysm may act as a source of *\*embolism*. See also [ARTERIOVENOUS ANEURYSM](#).

Most aneurysms within the brain are congenital: there is a risk that they may burst, causing a *\*subarachnoid haemorrhage*. **Berry aneurysms** are small saccular aneurysms most commonly occurring in the branches of the *\*circle of Willis*. Usually associated with congenital weakness of the vessels, these aneurysms are a cause of fatal intracranial haemorrhage in young adults. **Charcot–Bouchard aneurysms** are small aneurysms found on tiny arteries within the brain of elderly and hypertensive subjects. These aneurysms may rupture, causing cerebral haemorrhage. Options for treatment of cerebral aneurysms include surgical clipping of the aneurysm and placing metallic coils within the aneurysm to establish a clot within it (endovascular *\*coiling*).

In a **pseudoaneurysm** (or **false aneurysm**) the swelling of the artery is contained by clotted blood rather than the wall of the artery. —**aneurysmal** *adj.*

**Angelman syndrome** a neurogenetic disorder characterized by severe developmental delay, absence of speech, seizures, a jerky puppet-like gait (see [ATAXIA](#)), and paroxysmal laughter (giving it the alternative name **happy puppet syndrome**). Affected children commonly have cranial and facial abnormalities, such as a small or flattened head. Angelman syndrome is a

prototype of genomic **\*imprinting**: a deletion on maternal chromosome 15 is the cause in a majority of cases. [H. Angelman (1915–96), British paediatrician]

**angi- (angio-)** *combining form denoting blood or lymph vessels*. Examples: **angiectasis** (abnormal dilation of); **angiopathy** (disease of); **angiotomy** (cutting of).

**angiitis** *n. see VASCULITIS*.

**angina** *n.* a sense of suffocation or suffocating pain. *See* **ANGINA PECTORIS**; **LUDWIG'S ANGINA**.

**angina pectoris** pain in the centre of the chest, which is induced by exercise and relieved by rest and may spread to the jaws and arms. Angina pectoris occurs when the demand for blood by the heart exceeds the supply of the coronary arteries and it usually results from coronary artery **\*atheroma**. It may be prevented or relieved by such drugs as **\*glyceryl trinitrate** and **\*beta blockers**. If drug treatment proves ineffective, **\*coronary angioplasty** or **\*coronary artery bypass grafts** may be required, the former being less invasive than the latter.

**angiodysplasia** *n.* an abnormal collection of small blood vessels found in the mucosa of the gastrointestinal tract, which are thought to be due to degeneration of previously healthy blood vessels. Angiodysplasia may be isolated lesions or found in clusters; they are located predominately in the caecum or ascending colon and they may bleed or contribute to iron-deficiency anaemia. Angiodysplasia may be diagnosed at endoscopy or angiography. Treatment includes endoscopic coagulation with **\*diathermy**, **\*argon plasma coagulation**, **\*embolization** at angiography, or surgical resection in cases not responding to other treatments.

**angiogenesis** *n.* the formation of new blood vessels, which occurs during wound healing and is promoted by growth factors (*see* **VASCULAR ENDOTHELIAL GROWTH FACTOR**). This process is also seen in many malignant tumours and has become a target for anticancer therapy (*see* **ANGIOGENESIS INHIBITOR**).

**angiogenesis inhibitor** an agent that prevents the development of new blood vessels (**\*angiogenesis**) by inhibiting the action of **\*vascular endothelial growth factor** (it is also known as **anti-VEGF**). Angiogenesis inhibitors are used as anticancer drugs, since growing cancers have a greater need for blood supply than normal tissue and must develop new blood vessels before progressing beyond a very small size. They include **\*aflibercept**, **\*bevacizumab**, and **\*thalidomide**. Because of their action, some of these drugs are used in the treatment of wet age-related **\*macular degeneration**.

**angiography** *n.* imaging of blood vessels (*see also* **CORONARY ANGIOGRAPHY**; **LYMPHANGIOGRAPHY**). In the older form of angiography X-ray imaging was carried out after injection of **\*radiopaque** contrast medium and **\*digital subtraction** applied to enhance visualization. The use of X-rays has now been largely replaced by methods using MRI or CT scanners. **Magnetic resonance angiography (MRA)** can be performed with (contrast-enhanced) or without (noncontrast) injection of a magnetic resonance contrast agent (*see* **CONTRAST MEDIUM**). Contrast-enhanced MRA will show the vessels better. These images can be reconstructed in two or three dimensions. **Computerized tomographic angiography (CTA)** uses a radiographic contrast agent, usually injected into a vein, to increase the visibility of the blood vessels. **Fluorescein angiography** is a common method of investigation in ophthalmology. **\*Fluorescein sodium** is injected into a vein in the arm, from which it circulates throughout the body. Light of an appropriate wavelength is shone into the eye, causing the dye in the retinal blood vessels to fluoresce. This allows the circulation through the retinal blood vessels to be observed and photographed. **Indocyanine green (ICG) angiography** uses indocyanine green dye, which fluoresces in infrared light. It is valuable in assessing circulation in the deeper layers of the **\*fundus**.

**angioid streaks** reddish to dark-brown irregular streaks radiating outwards from the optic disc underneath the retina. They represent irregular linear cracks in **\*Bruch's membrane** and can be the site for the development of new vessels from the choroid. They are seen in such systemic conditions as pseudoxanthoma elasticum, Paget's disease, and sickle-cell anaemia.

**angiokeratoma** *n.* a localized collection of thin-walled blood vessels covered by a cap of warty material. It is most often seen as **angiokeratoma of Fordyce**, purple papules on the scrotum or vulva of the elderly, which

should not be treated unless they bleed easily. Angiokeratomas can also occur on the hands and feet of children. The condition is not malignant and its cause is unknown. Angiokeratomas may be removed surgically. *See also* [FABRY DISEASE](#).

**angioma** *n.* a benign tumour composed of blood vessels or lymph vessels. **Cherry angiomas** (or **Campbell de Morgan spots**) are small red spots on the trunk in middle-aged or elderly people. They are completely harmless and consist of a minor vascular malformation. An **arteriovenous angioma** (or **malformation**) is a knot of distended blood vessels overlying and compressing the surface of the brain. It may cause epilepsy, or one of the vessels may burst, causing a [\\*subarachnoid haemorrhage](#) or a haemorrhage within the brain (intracerebral haemorrhage). This type of angioma may be suitable for surgical removal or stereotactic radiotherapy (*see* [STEREOTACTIC LOCALIZATION](#)). It may be associated with a purple birthmark on the face: this is called the **Sturge–Weber syndrome**. Arteriovenous malformations may occur in many other parts of the body, where they are often asymptomatic. *See also* [HAEMANGIOMA](#); [LYMPHANGIOMA](#).

**angio-oedema (angioneurotic oedema)** *n.* *see* [URTICARIA](#).

**angioplasty** *n.* repair or reconstruction of a narrowed or completely obstructed blood vessel. Traditionally, this was performed during open surgery, but in modern practice angioplasty commonly refers to **percutaneous transluminal angioplasty** (PTA; **balloon angioplasty**), in which an inflatable balloon, mounted on the tip of a flexible catheter, is placed within the lumen of the affected vessel at the site of the narrowing/blockage, under X-ray control. On inflation of the balloon the lumen is reopened with varying rates of success. A vascular stent may be required if the results are suboptimal. Common sites for PTA are coronary, carotid, renal, and leg arteries. *See also* [CORONARY ANGIOPLASTY](#).

**angioscope** *n.* **1.** a modified microscope used to study capillaries. **2.** a narrow flexible endoscope used to examine the interior of blood vessels.

**angiospasm** *n.* *see* [RAYNAUD’S DISEASE](#).

**angiotensin** *n.* either of two peptides: **angiotensin I** or **angiotensin II**. Angiotensin I is derived, by the action of the enzyme **\*renin**, from a protein (alpha globulin) secreted by the liver into the bloodstream. As blood passes through the lungs, another enzyme, **angiotensin-converting enzyme** (ACE), acts on angiotensin I to form angiotensin II. This peptide causes constriction of blood vessels and stimulates the release of the hormones **\*vasopressin** and **\*aldosterone**, which increase blood pressure. *See also* **ACE INHIBITOR**; **ANGIOTENSIN II ANTAGONIST**.

**angiotensin II antagonist** any one of a class of drugs that block the action of the hormone **\*angiotensin II**, which constricts blood vessels; they are therefore useful in treating **\*hypertension**. These drugs include **candesartan**, **irbesartan**, **losartan**, **telmisartan**, and **valsartan**. Side-effects are usually mild.

**angle** *n.* **1.** (in anatomy) a corner. For example, the **angle of the eye** is the outer or inner corner of the eye; the **angle of the mouth** is the site where the upper and lower lips join on either side. **2.** the degree of divergence of two lines or planes that meet each other; the space between two such lines. The **carrying angle** is the obtuse angle formed between the forearm and the upper arm when the forearm is fully extended and the hand is supinated.

**angle of Louis** *see* **STERNUM**.

**angstrom** *n.* a unit of length equal to one ten millionth of a millimetre ( $10^{-10}$  m). It is not a recommended **\*SI unit** but is sometimes used to express wavelengths and interatomic distances: the **\*nanometre** (1 nm = 10 Å) is now the preferred unit. Symbol Å.

**anhedonia** *n.* a reduction in or the total loss of the feeling of pleasure in acts that normally give pleasure.

**anhidrosis** *n.* the absence of sweating in the presence of an appropriate stimulus for sweating, such as heat. A reduction in sweating is known as **hypohidrosis**. Anhidrosis and hypohidrosis may accompany disease or occur as a congenital defect.

**anhidrotic** **1.** *n.* any drug that inhibits sweating, such as an **\*antimuscarinic** drug. **2.** *adj.* inhibiting sweating.

**anhydraemia** *n.* a decrease in the proportion of water, and therefore plasma, in the blood.

**anhydramnios** *n.* absence of amniotic fluid (liquor) surrounding the fetus. This can be associated with premature rupture of membranes, placental insufficiency, intrauterine growth restriction, and certain fetal renal abnormalities (e.g. **\*Potter syndrome**).

**anhydrase** *n.* an enzyme that catalyses the removal of water from a compound.

**anima/animus** *n.* see **ARCHETYPE**.

**anion** *n.* an ion of negative charge, such as a bicarbonate ion ( $\text{HCO}_3^-$ ) or a chloride ion ( $\text{Cl}^-$ ) (*See also* **ELECTROLYTE**). The **anion gap** is the difference between the concentrations of cations (positively charged ions) and anions, calculated from the formula:

$$(\text{Na}^+ + \text{K}^+) - (\text{HCO}_3^- + \text{Cl}^-)$$

It is used to estimate the unaccounted-for anions in the blood in cases of metabolic disturbance. The normal anion gap is 12–16 mmol/l.

**aniridia** *n.* congenital absence of the iris (of the eye). This may be a hereditary condition, associated with macular dysplasia, sensory nystagmus, and congenital cataract. *See also* **WAGR SYNDROME**.

**aniseikonia** *n.* a condition in which the image of an object differs markedly in size or shape between the two eyes.

**anisocoria** *n.* inequality in the size of the pupils of the two eyes, usually a difference of more than 1 mm in diameter. For diagnosis, it is important to establish which of the pupils is behaving abnormally.

**anisocytosis** *n.* an excessive variation in size between individual red blood cells. Anisocytosis is measured by some automatic analysers; these automated instruments calculate the red cell distribution width (RDW), which reflects anisocytosis. Anisocytosis may be a feature of almost any disease affecting the blood.

**anisomelia** *n.* a difference in size or shape between the arms or the legs.

**anisometropia** *n.* the condition in which the power of **\*refraction** in one eye differs significantly from that in the other.

**ankle** *n.* **1.** the hinge joint between the leg and the foot. It consists of the **\*talus** (ankle bone), which projects into a socket formed by the lower ends of the **\*tibia** and **\*fibula**. **2.** the whole region of the ankle joint, including the **\*tarsus** and the ends of the tibia and fibula.

**ankle jerk** a deep tendon reflex elicited when the Achilles tendon is stretched and then struck with a tendon hammer. The normal response is reflex contraction of the calf muscles and plantar flexion of the ankle. The ankle jerk may be increased if the spinal cord is compressed above the level of the first sacral spinal nerve (which arises at the level of the second lumbar vertebra). If the nerve itself is cut or compressed the reflex is reduced or absent.

**ankyloblepharon** *n.* an abnormal fusion (partial or complete) of the upper and lower eyelid margins.

**ankyloglossia (tongue-tie)** *n.* a congenital anomaly in which an unusually short, thick, or tight **\*fraenum** restricts the mobility of the tongue. It is often first noticed in a newborn who has difficulty breastfeeding. No treatment is required unless the condition is extreme, in which case surgical division of the fraenum may be necessary.

**ankylosing spondylitis** *see* SPONDYLITIS.

**ankylosis** *n.* pathological fusion of two bones across a joint space resulting from prolonged joint inflammation or infection. In **bony ankylosis** the joint space is obliterated by bony tissue as a result of chronic inflammatory conditions, such as ankylosing **\*spondylitis** **\*psoriatic arthritis**, **\*rheumatoid arthritis**, or **\*septic arthritis**. **Fibrous ankylosis**, in which there is a shortening of the connecting fibrous tissue, results from healing with fibrosis and is commonly associated with chronic arthritis due to tuberculous infection.

**Ankylostoma** *n. see* ANCYLOSTOMA.

**annulus** *n.* (in anatomy) a circular opening or ring-shaped structure. — **annular** *adj.*

**anodontia** *n.* the absence of all primary and/or permanent teeth because they have failed to develop. It is more common for only a few teeth to fail to develop (*see* **HYPODONTIA**; **OLIGODONTIA**).

**anodyne** *n.* any treatment or drug that soothes and eases pain.

**anogenital warts** *see* **CONDYLOMA**; **WART**.

**anomaloscope** *n.* an instrument for testing colour discrimination. By adjusting the controls the subject has to produce a mixture of red and green light to match a yellow light. The matching is done on a brightly illuminated disc viewed down a telescope.

**anomalous pulmonary venous drainage** a congenital abnormality in which the pulmonary veins enter the right atrium or vena cava instead of draining into the left atrium. The clinical features are those of an **\*atrial septal defect**.

**anomaly** *n.* any deviation from the normal, especially a congenital or developmental defect.

**anomia** *n.* a form of **\*aphasia** in which the patient is unable to give the names of objects, although retaining an understanding of their use and the ability to put words together into speech. It sometimes occurs after a stroke or in certain types of dementia.

**anonychia** *n.* congenital absence of one or more nails.

**Anopheles** *n.* a genus of widely distributed mosquitoes, occurring in tropical and temperate regions, with some 350 species. The malarial parasite (*see* **PLASMODIUM**) is transmitted to humans solely through the bite of female *Anopheles* mosquitoes. Some species of *Anopheles* may transmit the parasites of bancroftian **\*filariasis**.

**anophthalmos** *n.* congenital absence of the eye.

**anoplasty** *n.* a surgical technique used to repair a weak or injured anal sphincter.

**anorchism** *n.* congenital absence of one or both testes.

**anorexia** *n.* loss of appetite.

**anorexia nervosa** a psychiatric illness in which the patients starve themselves or use other techniques, such as vomiting or taking laxatives, to induce weight loss. To fulfil ICD-10 criteria for anorexia nervosa a patient must have a distorted body image (thinking they are overweight when they are not), a defined weight loss or **\*body mass index** reduction, amenorrhoea, and vomiting or purging. The illness is most common in female adolescents, but about 10% of sufferers are male. There is a significant mortality associated with anorexia nervosa because of the medical consequences of weight loss. The causes of the illness are not clearly understood: problems within the family, rejection of adult sexuality, self-harming behaviour in the context of an **\*emotionally unstable personality disorder**, and performance pressure are hypothesized as factors involved. Patients must be persuaded to eat enough to maintain a normal body weight and their emotional disturbance is usually treated with **\*psychotherapy** supported by a dietician and possibly the **\*community mental health team**. *See also* BULIMIA.

**anosmia** *n.* absence of the sense of smell. This can be temporary, as with a cold or other forms of **\*rhinitis**, or it can be permanent, following certain viral infections, head injuries, and tumours affecting the **\*olfactory nerve**. If loss of the sense of smell is partial rather than total, the condition is called **hyposmia**.

**anosognosia** *n.* failure to be aware of one's disability, often resulting from right hemisphere brain damage. It is seen with a range of deficits, including **\*hemiplegia** and **\*hemispatial neglect**. A striking example is **Anton's syndrome**, in which patients believe they can see normally despite being completely blind following severe bilateral damage to the visual cortex.

**anovulation** *n.* failure of the ovary to develop and release a female germ cell (ovum). **Anovular menstruation** is uterine bleeding in the absence of ovulation.

**anoxaemia** *n.* a condition in which there is less than the normal concentration of oxygen in the blood. *See also* ANOXIA; HYPOXAEMIA.

**anoxia** *n.* a condition in which the tissues of the body receive inadequate amounts of oxygen. This may result from low atmospheric pressure at high

altitudes; a shortage of circulating blood, red blood cells, or haemoglobin; or disordered blood flow, such as occurs in heart failure. It can also result from insufficient oxygen reaching the blood in the lungs due to poor breathing movements or because disease, such as pneumonia, is reducing the effective surface area of lung tissue. *See also* [HYPOXIA](#). —**anoxic** *adj.*

**ANP** atrial *\*natriuretic peptide*.

**ansa** *n.* (in anatomy) a loop; for example, the **ansa hypoglossi** is the loop formed by the descending branch of the hypoglossal nerve.

**ansiform** *adj.* (in anatomy) shaped like a loop. The term is applied to certain lobules of the cerebellum.

**ant-** (**anti-**) *prefix denoting* opposed to; counteracting; relieving. Examples: **antarthritic** (relieving arthritis); **antibacterial** (destroying or stopping the growth of bacteria).

**Antabuse** *n.* *see* [DISULFIRAM](#).

**antacid** *n.* a drug that neutralizes the hydrochloric acid secreted in the digestive juices of the stomach. Antacids, which include aluminium and magnesium compounds, are used to relieve pain and discomfort in disorders of the digestive system, including peptic ulcer.

**antagonist** *n.* **1.** a muscle whose action (contraction) opposes that of another muscle (called the **agonist** or **prime mover**). Antagonists relax to allow the agonists to effect movement. **2.** a drug or other substance with opposite action to that of another drug or natural body chemical, which it inhibits. Examples are the *\*antimetabolites*. —**antagonism** *n.*

**antazoline** *n.* a short-acting *\*antihistamine* drug, applied topically in combination with the sympathomimetic drug *\*xylometazoline* to treat allergic conjunctivitis.

**ante-** *prefix denoting* before. Examples: **antenatal** (before birth); **anteprandial** (before meals).

**anteflexion** *n.* the bending forward of an organ. A mild degree of anteflexion of the uterus is considered to be normal. *Compare* [RETROFLEXION](#).

**antegrade** *adj.* along the direction of the flow of (blood or urine), e.g. antegrade arterial access, antegrade *\*urethrography*. Compare RETROGRADE.

**ante mortem** before death. Compare POST MORTEM.

**antenatal diagnosis** *see* PRENATAL DIAGNOSIS.

**ante partum** *adj.* occurring before the onset of labour.

**ante partum haemorrhage (APH)** bleeding from the genital tract after the 20th week of pregnancy until the birth of the baby. Dangerous causes include *\*abruptio placentae* and *\*placenta praevia*.

**anterior** *adj.* **1.** describing or relating to the front (ventral) portion of the body or limbs. **2.** describing the front part of any organ. For example, the **anterior chamber** of the eye is that part of the eye between the cornea and the lens, which is filled with aqueous humour.

**anteroposterior (AP)** *adj.* from the front to the back. In radiography, AP denotes a radiograph in the *\*coronal* plane taken when the X-ray beam is directed from the front to the back of the patient with the X-ray film or detector at the back to capture the image. Compare DECUBITUS; POSTEROANTERIOR.

**anteversion** *n.* the forward inclination of an organ, especially the normal forward inclination of the uterus. Compare RETROVERSION.

**anthelmintic** **1.** *n.* any drug or chemical agent used to destroy parasitic worms (helminths), e.g. tapeworms, roundworms, and flukes, and/or remove them from the body. Anthelmintics include *\*albendazole*, *\*mebendazole*, *\*niclosamide*, and *\*praziquantel*. **2.** *adj.* having the power to destroy or eliminate helminths.

**anthracosis** *n. see* COAL-WORKER'S PNEUMOCONIOSIS.

**anthracycline** *n.* any of 500 or so antibiotics synthesized or isolated from species of *Streptomyces*. *\*Doxorubicin* is the most important member of this group of compounds, which have wide activity, particularly against breast

cancer and lymphoma; others include *\*daunorubicin* and *epirubicin*. See **CYTOTOXIC DRUG**.

**anthrax** *n.* an acute infectious disease of farm animals caused by the bacterium *Bacillus anthracis*, which can be transmitted to humans by contact with animal hair, hides, or excrement. In humans the disease attacks either the lungs, causing pneumonia, or the skin, producing severe ulceration (known as **malignant pustule**). **Woolsorter's disease** is a serious infection of the skin or lungs by *B. anthracis*, affecting those handling wool or pelts (see **OCCUPATIONAL DISEASE**). Untreated anthrax can be fatal but administration of large doses of penicillin or tetracycline is usually effective.

**anthrop-** (**anthropo-**) *combining form denoting the human race*. Examples: **anthropogenesis** or **anthropogeny** (origin and development of); **anthropoid** (resembling); **anthropology** (science of).

**anthropometry** *n.* the taking of measurements of the human body or its parts. Comparisons can then be made between individuals of different sexes, ages, and races to determine the difference between normal and abnormal development. —**anthropometric** *adj.*

**anthropozoonosis** *n.* a disease that is transmissible from an animal to a human, or vice versa, under natural conditions. Diseases that are found primarily in animals and sometimes affect humans include *\*leptospirosis*, *\*anthrax*, and *\*rabies*.

**anti-androgen** *n.* any one of a group of drugs that inhibit the action of testosterone on the prostate gland by blocking androgen receptors, competing for binding sites, or decreasing androgen production. They are therefore used in the treatment of prostate cancer, which is an androgen-dependent tumour. Anti-androgens include *\*abiraterone acetate*, *\*bicalutamide*, *\*cyproterone*, *\*finasteride*, and *\*flutamide*.

**anti-arrhythmic** *adj.* describing a group of drugs used to correct irregularities in the heartbeat (see **ARRHYTHMIA**). They include *\*adenosine*, *\*amiodarone*, *\*verapamil*, *\*disopyramide*, *\*flecainide*, and *\*lidocaine*.

**antibacterial** *adj.* describing an antibiotic that is active against bacteria.

**antibiotic** *n.* a substance, produced by or derived from a microorganism, that destroys or inhibits the growth of other microorganisms. Antibiotics are used to treat infections caused by organisms that are sensitive to them, usually bacteria or fungi. They may alter the normal microbial content of the body (e.g. in the intestine, lungs, bladder) by destroying one or more groups of harmless or beneficial organisms, which may result in infections (such as thrush in women) due to overgrowth of resistant organisms. These side-effects are most likely to occur with **broad-spectrum antibiotics** (those active against a wide variety of organisms). Resistance may also develop in the microorganisms being treated; for example, through incorrect dosage or overprescription (*see also* [SUPERINFECTION](#)). Antibiotics should not be used to treat minor infections, which will clear up unaided. Some antibiotics may cause allergic reactions. There is now a rising concern that many infectious organisms have developed resistance to the commonly used antibiotics, and that the world is in danger of running out of effective new pharmaceutical agents to take their place. *See also* [AMINOGLYCOSIDES](#); [ANTIFUNGAL](#); [ANTIVIRAL DRUG](#); [CEPHALOSPORIN](#); [PENICILLIN](#); [QUINOLONE](#); [TETRACYCLINES](#).

**antibody** *n.* a special kind of blood protein that is synthesized in lymphoid tissue in response to the presence of a particular [\\*antigen](#) and circulates in the plasma to attack the antigen and render it harmless. The production of specific antibodies against antigens as diverse as invading bacteria, inhaled pollen grains, and foreign red blood cells is the basis of both [\\*immunity](#) and [\\*allergy](#). Chemically, antibodies are proteins of the globulin type; they are classified according to their structure and function (*see* [IMMUNOGLOBULIN](#)).

**anticardiolipin antibodies** autoantibodies that are directed against phospholipid-binding plasma proteins found in [\\*antiphospholipid antibody syndrome](#), which is characterized by venous and arterial thrombosis and recurrent miscarriages.

**anticholinergic** *adj.* *see* [ANTIMUSCARINIC](#).

**anticholinesterase** *n.* any substance that inhibits the action of [\\*cholinesterase](#), the enzyme that is responsible for the breakdown of the neurotransmitter acetylcholine, and therefore allows acetylcholine to

continue transmitting nerve impulses. Drugs with anticholinesterase activity include *\*neostigmine*, *\*pyridostigmine*, and *\*edrophonium*; their uses include the diagnosis and treatment of *\*myasthenia gravis*. *See also* PARASYMPATHOMIMETIC.

**anticoagulant** *n.* an agent that prevents the clotting of blood. The natural anticoagulant *\*heparin* directly interferes with blood clotting and is active both within the body and against a sample of blood in a test tube. Synthetic drugs, such as *\*warfarin*, are effective only within the body, since they act by affecting blood coagulation factors (*see* BLOOD COAGULATION). They take longer to act than heparin. Anticoagulants are used to prevent the formation of blood clots or to break up clots in blood vessels in such conditions as thrombosis and embolism. Incorrect dosage may result in haemorrhage (*see* INR). *See also* DIRECT ORAL ANTICOAGULANT; FIBRINOLYTIC.

**anticonvulsant** *n.* a drug that prevents or reduces the severity and frequency of seizures in various types of epilepsy; the term **antiepileptic drug** is now preferred since not all epileptic seizures involve convulsions. The choice of drug is dictated by the type of seizure and the patient's response, and the dosage must be adjusted carefully as individuals vary in their response to these drugs and side-effects may be troublesome. Commonly used antiepileptic drugs include *\*carbamazepine*, *\*lamotrigine*, *\*phenytoin*, *\*sodium valproate*, **levetiracetam**, **topiramate**, *\*gabapentin*, **pregabalin**, and **oxcarbazepine**. Phenobarbital is no longer commonly prescribed.

Certain anticonvulsants have shown efficacy in treating bipolar disorder and chronic pain, as in postherpetic neuralgia or *\*peripheral neuropathy*, and can be used to prevent migraine and other primary headache syndromes.

**antidepressant** *n.* a drug designed to alleviate the symptoms of *\*depression*. Most antidepressants act by altering the availability of *\*serotonin* and *\*noradrenaline* in the brain; they are also likely to influence synaptic transmission regulation and postsynaptic conduction. There are four main classes of antidepressants. The **selective serotonin reuptake inhibitors**, such as fluoxetine, sertraline, escitalopram, and citalopram (*see* SSRI), are recommended as first-line treatment for depression and anxiety by current NICE guidelines. Their mode of action is entirely on serotonin. Side-effects include gastrointestinal problems and nausea. **Tricyclic antidepressants**, such as *\*imipramine*, *\*doxepin*, *\*lofepramine*, *\*clomipramine*, and

**\*amitriptyline**, are also widely used. They act on noradrenaline as well as serotonin, although most of them primarily have a noradrenergic action. They are also used in chronic pain management. Their side-effect profile varies from that of SSRIs; on the whole they have more **\*antimuscarinic** effects and are more sedative. They are more dangerous in overdose than SSRIs and cause more weight gain. Other side-effects include postural hypotension. **Serotonin and noradrenaline reuptake inhibitors**), such as venlafaxine and duloxetine (see **SNRI**), are a common second-line choice in the treatment of depression and anxiety. **Monoamine oxidase inhibitors (MAOIs)**, such as the reversible moclobemide and the irreversible phenelzine (see **MAO INHIBITOR**), are older antidepressants. They are now less used because of significant side-effects and interactions with other drugs. The irreversible MAOIs also require certain dietary restrictions. Antidepressants are not addictive, but depending on their half-life they show a varying prevalence of **\*discontinuation syndrome**. Antidepressants have consistently been shown to be more effective than placebo. Their efficacy is lower in mild depression but moderate to good in moderate and severe depression. They are part of the gold-standard treatment for depression and anxiety.

**antidiabetic drugs** drugs used to control **\*diabetes mellitus**. Type 1 diabetes is treated with the wide range of formulations of **\*insulin**. Type 2 diabetes is treated mainly with **\*oral hypoglycaemic drugs** but in some cases insulin may be required.

**anti-D immunoglobulin (anti-D Ig)** a preparation of anti-D, a **\*rhesus factor** antibody formed by Rh-negative individuals following exposure to Rh-positive blood (usually by exchange between fetal and maternal blood in Rh-negative women who carry a Rh-positive fetus). Anti-D Ig is administered (by intramuscular injection) to Rh-negative women within 72 hours of giving birth to a Rh-positive child (or following miscarriage or abortion) to prevent the risk of **\*haemolytic disease of the newborn** in a subsequent child. It rapidly destroys any remaining Rh-positive cells, which could otherwise stimulate antibody production affecting the next pregnancy. Anti-D is also available as antenatal prophylaxis to all Rh-negative pregnant women.

**antidiuretic hormone (ADH)** see **VASOPRESSIN**.

**antidote** *n.* a drug that counteracts the effects of a poison or of overdose by another drug. Examples are *\*desferrioxamine* and *\*edetate*.

**antidromic** *adj.* describing impulses travelling ‘the wrong way’ in a nerve fibre. This is rare but may happen in shingles, when the irritation caused by the virus in the spinal canal initiates impulses that travel outwards in normally afferent nerves. The area of skin that the sensory nerves supply (usually a strip on the trunk) becomes painfully blistered. Antidromic impulses cannot pass *\*synapses*, which work in one direction only.

**antiemetic** *n.* a drug that prevents vomiting. Various drugs have this effect, including some *\*antihistamines* (e.g. cyclizine, promethazine) and *\*antimuscarinic* drugs. They are used for such conditions as motion sickness and vertigo; drugs used to counteract nausea and vomiting due to other causes (e.g. cytotoxic drugs) include *\*domperidone*, *\*metoclopramide*, and *\*ondansetron*.

**antiepileptic drug** *see* ANTICONVULSANT.

**antifibrinolytic** *adj.* describing an agent that inhibits the dissolution of blood clots (*see* FIBRINOLYSIS). Antifibrinolytic drugs include *\*tranexamic acid*.

**antifungal (antimycotic)** *adj.* describing a drug that kills or inactivates fungi and is used to treat fungal (including yeast) infections. Antifungal drugs include *\*amphotericin*, *\*griseofulvin*, the *\*imidazoles*, *\*itraconazole*, *\*nystatin*, and *\*terbinafine*.

**antigen** *n.* any substance that may be specifically bound by an *\*antibody* molecule. In order to generate antibodies specific for small molecules, the latter are attached to a larger molecule before immunization. The small molecule is called a **hapten**; the larger molecule is called a **carrier**. — **antigenic** *adj.*

**antigen-presenting cell (APC)** a cell, such as a *\*dendritic cell* or a *\*macrophage*, that processes antigen for presentation to a T lymphocytes (*see* HELPER T CELL).

**antihelix (anthelex)** *n.* the curved inner ridge of the *\*pinna* of the ear.

**antihistamine** *n.* a drug that inhibits the action of **\*histamine** by blocking specific histamine receptors. Four histamine receptors have been identified ( $H_1$  to  $H_4$ ).  **$H_1$ -receptor antagonists** are used for symptomatic relief of allergic conditions, such as hay fever, pruritus (itching), and urticaria (nettle rash). Many  $H_1$ -receptor antagonists, e.g. **\*cyclizine** and **\*promethazine**, also have a strong **\*antiemetic** activity and are used to prevent motion sickness. The most common side-effect of these drugs, especially the older antihistamines (e.g. **\*alimemazine**, promethazine), is drowsiness and because of this they are sometimes used for sedation. Newer antihistamines, e.g. **cetirizine**, **loratidine**, **mizolastine**, are less sedating. Other side-effects include dizziness, blurred vision, tremors, digestive upsets, and lack of muscular coordination.

$H_2$  receptors are mainly found in the stomach, where stimulation by histamine causes secretion of acid gastric juice.  **$H_2$ -receptor antagonists** (e.g. **\*cimetidine**, **\*nizatidine**, **\*ranitidine**, and **\*famotidine**) block these receptors and reduce gastric acid secretion; they are used in the treatment of functional dyspepsia, **\*peptic ulcers**, and **\*gastro-oesophageal reflux disease**.  **$H_3$ - and  $H_4$ -receptor antagonists** have yet to find a clinical role.

**antihypertensive drugs** drugs used in treating high blood pressure (*see* **HYPERTENSION**).

**anti-inflammatory 1.** *adj.* describing a drug that reduces **\*inflammation**. The various groups of anti-inflammatory drugs act against one or more of the mediators that initiate or maintain inflammation. Some groups suppress only certain aspects of the inflammatory response. The main groups of anti-inflammatory drugs are the **\*antihistamines**, the glucocorticoids (*see* **CORTICOSTEROID**), and the nonsteroidal anti-inflammatory drugs (*see* **NSAID**). **2.** *n.* an anti-inflammatory drug.

**antiketogenic** *n.* an agent that prevents formation of **\*ketones** in the body.

**antilymphocyte serum (antilymphocyte globulin, ALS, ALG)** an **\*antiserum**, containing antibodies that suppress lymphocytic activity, prepared by injecting an animal with lymphocytes. ALS may be given to a patient to prevent the immune reaction that causes tissue rejection following transplantation of such organs as kidneys or of bone marrow. Administration

naturally also impairs other immunity mechanisms, making infection a serious hazard.

**antimetabolite** *n.* any one of a group of drugs that interfere with the normal metabolic processes within cells by combining with the enzymes responsible for them. Some drugs used in the treatment of cancer, e.g. *\*cytarabine*, *\*fluorouracil*, *\*methotrexate*, and *\*mercaptopurine*, are antimetabolites that prevent cell growth by interfering with enzyme reactions essential for nucleic acid synthesis. For example, fluorouracil inhibits the enzyme thymidylate synthetase. Side-effects of antimetabolites can include blood cell disorders and digestive disturbances. *See also* **CHEMOTHERAPY**; **CYTOTOXIC DRUG**.

**antimitotic** *n.* any one of a group of drugs that inhibit cell division and growth, e.g. *\*doxorubicin*. The drugs used to treat cancer are mainly antimitotics. *See also* **ANTIMETABOLITE**; **CYTOTOXIC DRUG**.

**anti-Müllerian hormone** *see* **MÜLLERIAN DUCT**.

**antimuscarinic (anticholinergic)** *adj.* inhibiting the action of *\*acetylcholine*, the neurotransmitter that conveys information in the parasympathetic nervous system. Antimuscarinic drugs block the effects of certain (muscarinic) receptors (hence their name). The actions of these drugs include relaxation of smooth muscle, decreased secretion of saliva, sweat, and digestive juices, and dilation of the pupil of the eye. *\*Atropine* and similar drugs have these effects; they are used in the treatment of gut spasms (e.g. *\*propantheline*) and of parkinsonism (e.g. *\*trihexyphenidyl*) as bronchodilators (e.g. *\*ipratropium*), and as *\*mydriatics*. Characteristic side-effects include dry mouth, thirst, blurred vision, dry skin, increased heart rate, and difficulty in urination.

**antimutagen** *n.* a substance that can either reduce the spontaneous production of mutations or prevent or reverse the action of a *\*mutagen*.

**antimycotic** *adj.* *see* **ANTIFUNGAL**.

**antinuclear antibody (ANA)** an autoantibody directed against nuclear membranes, found in systemic *\*lupus* erythematosus and other autoimmune rheumatic diseases, such as *\*Sjögren's syndrome*, *\*scleroderma*, and inflammatory *\*myositis*.

The different types of ANAs are defined by their target antigen and different profiles have been correlated with clinical features.

**anti-oestrogen (oestrogen-receptor antagonist)** *n.* one of a group of drugs that oppose the action of oestrogen by binding to **\*oestrogen receptors** in the body's tissues. The most important of these drugs is currently **\*tamoxifen**, which is used in the treatment of breast cancers dependent on oestrogen. Because they stimulate the production of pituitary **\*gonadotrophins**, some anti-oestrogens (e.g. **\*clomifene**, tamoxifen) are used to induce or stimulate ovulation in infertility treatment. Side-effects of anti-oestrogens include hot flushes, itching of the vulva, nausea, vomiting, fluid retention, and sometimes vaginal bleeding.

**antioxidant** *n.* a substance capable of neutralizing oxygen free radicals – the highly active and damaging atoms and chemical groups produced by normal metabolic processes, by various disease processes, and by poisons, radiation, smoking, and other agencies. Antioxidants occur naturally in the body and in certain foods and beverages; they may also be ingested in the form of supplements. They include **\*vitamin C** (ascorbic acid), **\*vitamin E** (tocopherols), and  $\beta$ -**\*carotene**. *See also* PHYTOCHEMICAL.

**antiphospholipid antibody syndrome (APS, Hughes syndrome)** an autoimmune disease in which the presence of antibodies against phospholipid (see **ANTICARDIOLIPIN ANTIBODIES**; **LUPUS ANTICOAGULANT**) is associated with a tendency to arterial or venous thrombosis and, in women of childbearing age, to recurrent miscarriage. APS may be primary or occur in association with systemic lupus erythematosus (SLE) or other connective-tissue diseases. Treatment is by low-dose aspirin or heparin.

**antiplatelet drug** any one of a class of drugs that reduce platelet aggregation (see **PLATELET ACTIVATION**) and therefore the formation of clot (see **THROMBOSIS**). Examples are **\*abciximab**, **\*aspirin**, **\*clopidogrel**, **prasugrel**, and **ticagrelor**.

**antipruritic** *n.* an agent that relieves itching (**\*pruritus**). Examples are **\*doxepin** and **\*crotamiton**, applied in creams or lotions, and some

**\*antihistamine** drugs (e.g. **\*alimemazine**), used if the itching is due to an allergy.

**antipsychotic** *n.* any one of a group of drugs used to treat severe mental disorders (psychoses), including schizophrenia and mania; some are administered in small doses to relieve anxiety and tic disorders or to treat impulsivity in **\*emotionally unstable personality disorder**. Formerly called **major tranquillizers**, and later **typical** and **atypical antipsychotics**, they are now known as first- and second-generation antipsychotics. The **first-generation** (or **typical**) **antipsychotics** include the **\*phenothiazines** (e.g. **\*chlorpromazine**), **\*butyrophenones** (e.g. **\*haloperidol**), and **thioxanthenes** (e.g. **\*flupentixol**). Side-effects of antipsychotic drugs can include **\*extrapyramidal effects**, sedation, **\*antimuscarinic** effects, weight gain, and **\*long QT syndrome**. The **second-generation** (or **atypical**) **antipsychotics** are a group of more recently developed drugs that are in theory associated with fewer extrapyramidal effects than first-generation antipsychotics: they include **\*clozapine**, **\*risperidone**, **amisulpride**, **aripiprazole**, **olanzapine**, and **quetiapine**. Antipsychotics act on various neurotransmitter receptors in the brain, including dopamine, histamine, serotonin, and cholinergic receptors. Most of them block neurotransmitter activity, but some have partially agonistic effects. Recent evidence suggests that there are significant differences among the second-generation antipsychotics regarding their efficacy and side-effect profiles. Clozapine, amisulpride, and olanzapine were found to be the most effective antipsychotics. Clozapine, zotepine, and olanzapine caused the most weight gain; haloperidol, zotepine, and chlorpromazine caused the most extrapyramidal side-effects; sertindole, amisulpride, and ziprasidone caused the most QT-prolongation; and clozapine, zotepine, and chlorpromazine caused the most sedation.

**antipyretic** *n.* a drug that reduces fever by lowering the body temperature. Several analgesic drugs have antipyretic activity, including **\*aspirin** and **\*paracetamol**.

**antiretroviral drug (ARV)** any of a group of drugs that inhibit or slow the growth of **\*retroviruses**, specifically HIV, and are used in the treatment of HIV infection and **\*AIDS**. They include the **\*reverse transcriptase** inhibitors and the **\*protease inhibitors** (*see also* **MARAVIROC**; **RALTEGRAVIR**).

Treatment with a combination of antiretrovirals is known as **highly active antiretroviral therapy (HAART)**.

**antisecretory drug** any drug that reduces the normal rate of secretion of a body fluid, usually one that reduces acid secretion into the stomach. Such drugs include **\*antimuscarinic** drugs, H<sub>2</sub>-receptor antagonists (see **ANTI HISTAMINE**), and **\*proton-pump inhibitors**.

**antiseptis** *n.* the elimination of bacteria, fungi, viruses, and other microorganisms that cause disease by the use of chemical or physical methods.

**antiseptic** *n.* a chemical that destroys or inhibits the growth of disease-causing bacteria and other microorganisms and is sufficiently nontoxic to be applied to the skin or mucous membranes to cleanse wounds and prevent infections or to be used internally to treat infections of the intestine and bladder. Examples are **\*cetrimide**, **\*chlorhexidine**, and povidone-**\*iodine**.

**antiserum** *n.* (*pl.* **antisera**) a serum that contains antibodies against antigens of a particular kind; it may be injected to treat, or give temporary protection (passive **\*immunity**) against, specific diseases. Antisera are prepared in large quantities in such animals as horses. In the laboratory, they are used to identify unknown organisms responsible for infection (see **AGGLUTINATION**).

**antisocial personality disorder** a **\*personality disorder** characterized by callous unconcern for others, irresponsibility, violence, disregard for social rules, and an incapacity for maintaining enduring relationships. It is also known as **dyssocial personality** in ICD-10, **psychopathy**, and **sociopathy**.

**antispasmodic** *n.* a drug that relieves spasm of smooth muscle in the gut. Antispasmodics, which include **\*alverine citrate**, **\*dicycloverine**, and **mebeverine**, are used to treat irritable bowel syndrome and diverticular disease. *Compare* **ANTISPASTIC**.

**antispastic** *n.* a drug that relieves spasm of skeletal muscle. *See also* **MUSCLE RELAXANT**. *Compare* **ANTISPASMODIC**.

**antitachycardia pacing** termination of a **\*tachycardia** by temporarily pacing the heart at a faster rate.

**antithyroid drugs** drugs that are used to counteract the excessive production and release of thyroid hormones in thyrotoxic states. The main agents are *\*carbimazole* and *\*propylthiouracil*. *See also* THIONAMIDES.

**anti-TNF drugs** *see* CYTOKINE INHIBITOR.

**antitoxin** *n.* an antibody produced by the body to counteract a toxin formed by invading bacteria or from any other source.

**antitragus** *n.* a small projection of cartilage above the lobe of the ear, opposite the tragus. *See* PINNA.

**antitussive (cough suppressant)** *n.* a drug, such as *\*pholcodine* (a weak opioid), that suppresses coughing, possibly by reducing the activity of the cough centre in the brain and by depressing respiration. Some opioid analgesics also have antitussive activity, e.g. *\*codeine*, *\*diamorphine*, and *\*methadone*.

**anti-VEGF** an agent that inhibits the action of *\*vascular endothelial growth factor* (VEGF). *See* ANGIOGENESIS INHIBITOR.

**antivenene (antivenin)** *n.* an *\*antiserum* containing antibodies against specific poisons in the venom of such an animal as a snake, spider, or scorpion.

**antiviral drug** a drug effective against viruses that cause disease. Antiviral drugs include *\*DNA polymerase inhibitors* (e.g. *\*aciclovir*, *\*foscarnet*, *\*ganciclovir*), *\*ribavirin*, and *\*oseltamivir*; they are used for treating herpes, cytomegalovirus and respiratory syncytial virus infections, and influenza. Antiviral drugs are also used for treating HIV infection and AIDS (*see* ANTIRETROVIRAL DRUG).

**Anton's syndrome** *see* ANOSOGNOSIA. [G. Anton (1858–1933), Austrian neurologist]

**antrectomy** *n.* **1.** surgical removal of the bony walls of an *\*antrum*. *See* ANTROSTOMY. **2. (distal gastrectomy)** a surgical operation in which the gastric antrum is removed. Indications for antrectomy include peptic ulcer disease resistant to medical treatment, tumours, perforation, and gastric outlet obstruction.

**antroscope** *n.* inspection of the inside of the maxillary sinus (*see* **PARANASAL SINUSES**) using an **\*endoscope** (called an **antroscope**).

**antrostomy** *n.* a surgical operation to produce a permanent or semipermanent artificial opening to an **\*antrum** in a bone, so providing drainage for any fluid. The operation is sometimes carried out to treat infection or inflammation of the **\*paranasal sinuses**.

**antrum** *n.* **1.** a cavity, especially a cavity in a bone. The **mastoid** (or **tympanic**) **antrum** is the space connecting the air cells of the **\*mastoid process** with the chamber of the inner ear. **2.** (**gastric antrum**) the distal third of the **\*stomach**. —**antral** *adj.*

**ANUG** acute necrotizing ulcerating gingivitis: *see* **ULCERATIVE GINGIVITIS**.

**anuria** *n.* failure of urine production. Urgent assessment is required to determine the cause, which can be failure of the renal or prerenal stages of urine production or obstruction of urine outflow from the kidneys. Anuria is associated with increasing **\*uraemia** and may require **\*haemodialysis**.

**anus** *n.* the opening at the lower end of the alimentary canal, through which the faeces are discharged. It opens out from the **\*anal canal** and is guarded by two sphincters. The anus is closed except during defecation. —**anal** *adj.*

**anvil** *n.* (in anatomy) *see* **INCUS**.

**anxiety** *n.* generalized pervasive **\*fear**. **Anxiety disorders** are conditions in which anxiety dominates the patient's life or is experienced in particular situations; they include **\*panic disorder**, **\*post-traumatic stress disorder**, and **\*generalized anxiety disorder**. Symptoms include excessive worrying, disproportional fears, and a variety of physical symptoms. Treatment usually includes antidepressants, cognitive behavioural therapy, and anxiety management techniques.

**anxiety management** a **\*behaviour** therapy designed to allow patients who suffer from anxiety disorders to reduce their symptoms by learning how to achieve states of relaxation and deal with excessive **\*rumination** about anxiety-provoking thoughts.

**anxiolytic** *adj.* describing a group of drugs used for the short-term treatment of anxiety of various causes. Formerly known as **minor tranquillizers**, they include the **\*benzodiazepines** and **\*buspirone**. Common side-effects of these drugs are drowsiness and dizziness, and prolonged use may result in **\*dependence**.

**any qualified provider (AQP)** any of a range of suitable health-care providers in a scheme operating in the National Health Service from whom patients can choose to receive their care. These include providers from outside the NHS, such as social enterprises, charities, or private sector providers.

**A-O** Association for Osteosynthesis: denoting a widely used system for treating fractures by metal inserts.

**aorta** *n.* (*pl.* **aortae or aortas**) the main artery of the body, from which all others derive. It arises from the left ventricle (**ascending aorta**), arches over the top of the heart (*see* **AORTIC ARCH**) and descends in front of the backbone (**descending aorta**), giving off large and small branches and finally dividing to form the right and left **\*iliac arteries**. The part of the descending aorta from the aortic arch to the diaphragm is called the **thoracic aorta**; the part below the diaphragm is the **abdominal aorta**. —**aortic** *adj.*

**aortic aneurysm** *see* **ANEURYSM**.

**aortic arch** that part of the aorta that extends from the ascending aorta, upward over the heart and then backward and down as far as the fourth thoracic vertebra. **\*Stretch receptors** in its outer wall monitor blood pressure and form part of the system maintaining this at a constant level.

**aortic regurgitation** a leak of the aortic valve resulting in reflux of blood from the aorta into the left ventricle during diastole. Aortic regurgitation is most commonly due to degenerative ‘wear and tear’ of the aortic valve. Other causes include dilatation of the aortic root with secondary dilatation of the aortic valve, scarring of the aortic valve as a result of previous acute rheumatic fever, or destruction of the valve by infection (*see* **ENDOCARDITIS**). Mild cases are symptom-free, but patients more severely affected develop breathlessness, angina pectoris, and enlargement of the

heart; all have a diastolic murmur. A badly affected valve may be replaced surgically with a prosthesis.

**aortic replacement** a surgical technique used to replace a diseased length of aorta, most often the abdominal aorta. It usually involves inserting into the aorta a flexible tube of artificial material, which functions as a substitute for the diseased section.

**aortic stenosis** narrowing of the opening of the aortic valve due to fusion of the cusps that comprise the valve. It may result from previous rheumatic fever, or from calcification and scarring in a valve that has two *\*cusps* instead of the normal three, or it may be congenital. Aortic stenosis obstructs the flow of blood from the left ventricle to the aorta during systole. Breathlessness on effort, angina pectoris, and fainting may follow. The patient has a systolic *\*murmur*. When symptoms develop the valve should be replaced with a mechanical or biological prosthesis, either surgically or via a catheter (see [TRANSCATHETER AORTIC VALVE IMPLANTATION](#)).

**aortic valve** a valve in the heart, lying between the left ventricle and the aorta. It is a *\*semilunar valve* that prevents blood returning to the ventricle from the aorta.

**aortitis** *n.* inflammation of the aorta, which was previously common as a late complication of syphilis but is more often now associated with a variety of poorly understood autoimmune conditions (such as *\*Behçet's syndrome* and *\*Takayasu's disease*). Inflammation of the aortic wall may result in the formation of an aneurysm or vascular stenosis, obstructing blood flow to target organs. Chest pain may occur from pressure on surrounding structures or from the reduced blood supply to the heart. *\*Aortic regurgitation* may be found. Surgical repair to the aortic aneurysm or valve may be needed.

**aortocaval compression (supine hypotension)** compression of the aorta and inferior vena cava by a pelvic mass, such as the pregnant uterus, causing maternal hypotension when the woman adopts the supine position. The blood pressure usually returns to normal when the woman is turned onto a left lateral tilt.

**aortography** *n.* imaging of the aorta. In the traditional method a series of X-ray images were taken during the injection of X-ray dye into the aorta via a catheter. This technique has been largely replaced as a primary investigation

by other *\*cross-sectional imaging* methods, such as **CT aortography** and **MR aortography**.

**AP** *see* **ANTEROPOSTERIOR**.

**APACHE scoring system** *acute physiological and chronic health evaluation*: a tool used to assess the severity of illness in a critically ill patient and to estimate mortality. The assessment uses information from 12 physiological measurements, including temperature, blood pressure, arterial pH, and certain blood results.

**apareunia** *n.* inability to have penetrative intercourse due to physical discomfort, *\*vaginismus*, or an underlying psychological problem. *See* **DYSPAREUNIA**.

**apathetic hyperthyroidism** a condition seen in older patients with *\*thyrotoxicosis*, characterized by weight loss, slow atrial fibrillation, and severe depressive illness, rather than the usual florid symptoms. They have small goitres on examination and the blood tests confirm thyrotoxicosis, which is treated in the standard manner.

**apathy** *n.* an individual's lack of interest in or concern for matters that might be expected to affect him or her significantly. A sign of impaired motivation, it is associated with *\*depression*.

**APC** *see* **ANTIGEN-PRESENTING CELL**.

**APD 1.** *see* **AUDITORY PROCESSING DISORDER**. **2.** automated *\*peritoneal dialysis*.

**aperient** *n.* a mild *\*laxative*.

**Apert syndrome** a hereditary disorder characterized by *\*craniosynostosis*, underdevelopment of the midfacial tissues resulting in a sunken facial appearance, and *\*syndactyly* (fusion) of 2–5 digits ('mitten glove'). Variable mental deficits and cleft palate may result. The condition may be associated with *\*Crouzon syndrome*, in which case the fusion of the digits is less marked. *See also* **ACROCEPHALOSYNDACTYLY**. [E. Apert (1868–1940), French physician]

**apex** *n.* the tip or summit of an organ; for example the heart or lung. The apex of a **\*tooth** is the tip of the root, where there is a small hole (the **apical foramen**) through which vessels and nerves pass from the pulp to the periapical tissues. —**apical** *adj.*

**apex beat** the impact of the heart against the chest wall during **\*systole**. It can be felt to the left of the breastbone, in the space between the fifth and sixth ribs.

**apexification** *n.* a method of inducing a hard-tissue barrier at the apex of an immature tooth following traumatic injury that has caused the pulp to die.

**apexogenesis** *n.* a pulp-therapy procedure performed to encourage development and formation of the root end when an immature tooth has sustained injury following trauma but without pulp necrosis.

**Apgar score** a method of rapidly assessing the general state of a baby immediately after birth. A score of 0, 1, or 2 points is given for each sign, usually measured at one minute and five minutes after delivery (see **table**). Thus an infant scoring a total of 10 points would be in optimum condition. When the score is low, the test is repeated at intervals as a guide to short-term progress. [V. Apgar (1909–74), US anaesthetist]

Apgar score			
Apgar score	0	1	2
Appearance	Blue	Acrocyanotic	Pink
Pulse rate (bpm)	Absent	<100	>100
Reflex irritability	No response	Grimace	Vigorous cough/sneeze
Muscle tone	Limp	Some flexion of extremities	Active movement
Respiratory effort	Absent	Slow/irregular breaths	Good respiratory effort and cry

**aphagia** *n.* inability to swallow. *Compare* **DYSPHAGIA**.

**aphakia** *n.* absence of the lens of the eye: the state of the eye after a cataract has been removed when no intraocular lens has been inserted. —**aphakic** *adj.*

**aphakic spectacles** eyeglasses prescribed after cataract surgery when no intraocular lens is inserted into the eye (not common practice now). Usually these are thick convex lenses.

**aphasia (dysphasia)** *n.* a disorder of language affecting the generation and content of speech and its understanding (it is not a disorder of articulation: *see* **DYSARTHRIA**). It is caused by damage to the language-dominant half of the brain, which is usually the left hemisphere in a right-handed person. In **expressive aphasia** there is difficulty in producing language; in **receptive aphasia** there is difficulty with the comprehension of the spoken word. Aphasia is commonly accompanied by difficulties in reading and writing. — **aphasic** *adj.*

**aphonia** *n.* absence or loss of the voice caused by disease of the larynx or mouth or by disease of the nerves and muscles involved in the generation and articulation of speech. If loss of speech is due to a language defect in the cerebral hemispheres, the disorder is **\*aphasia**.

**aphrodisiac** *n.* an agent that stimulates sexual excitement.

**aphthous ulcer** a small ulcer, occurring singly or in groups in the mouth as white or red spots; their cause is unknown. Treatment is with topical tetracycline or topical corticosteroids.

**apical abscess** an infection in the bone around the apex of a tooth. An acute abscess is extremely painful and if left untreated may cause swelling of the jaw and sometimes the face. A chronic abscess may be completely asymptomatic. An abscess invariably results from damage to and infection of the pulp of the tooth. Treatment is drainage and **\*root canal treatment** or extraction of the tooth; antibiotics may give temporary relief. If left untreated, the infection may spread, resulting in severe complications and even mortality.

**apicectomy** *n.* (in dentistry) surgical removal of the apex of the root of a tooth, also referred to as **retrograde root canal treatment**, **root resection**, or **root-end resection**. The root end cavity is prepared and filled with a biocompatible material. The procedure is carried out when **\*root canal treatment** has failed and cannot be redone.

**aplasia** *n.* total or partial failure of development of an organ or tissue. *See also* **AGENESIS**. —**aplastic** *adj.*

**aplasia cutis congenita** the congenital absence of skin on the scalp, usually in one or more small patches. It may result from an infection in the uterus or from a developmental abnormality.

**aplastic anaemia** *see* **ANAEMIA**.

**APMPPE** acute posterior multifocal placoid **\*pigment epitheliopathy**.

**apneusis** *n.* a state in which prolonged inhalation occurs. It occurs when the appropriate inhibitory influences are prevented from reaching the inspiratory centre of the brain.

**apnoea** *n.* temporary cessation of breathing from any cause, formally defined as a reduction in nasal airflow to less than 30% of normal for more than 10 seconds. The presence of more than five episodes of apnoea per hour of sleep is indicative of **\*obstructive sleep apnoea**. Attacks of apnoea are common in newborn babies and should be taken seriously although they do not necessarily indicate serious illness. *See also* **SLEEP APNOEA**. —**apnoeic** *adj.*

**apnoea index** the number of **\*apnoea** episodes per hour of sleep.

**apnoea monitor** an electronic alarm that is activated by a sensor that responds to a baby's respiratory movements. It can be used at home to monitor babies thought to be at risk of **\*sudden infant death syndrome**.

**apocrine** *adj.* **1.** describing sweat glands that occur only in hairy parts of the body, especially the armpit and groin. These glands develop in the hair follicles and appear after puberty has been reached. The strong odours associated with sweating result from the action of bacteria on the sweat produced by apocrine glands. *Compare* **ECCRINE**. **2.** describing a type of gland that loses part of its protoplasm when secreting. *See* **SECRETION**.

**apolipoprotein** *n.* any one of a family of proteins that form the protein components of **\*lipoproteins**, which transport hydrophobic lipid molecules in the plasma. Individual members of the family are designated by the abbreviation 'Apo' followed by a capital letter. Apolipoproteins have a

range of molecular weights and perform a variety of functions during the life cycle of the lipoproteins in which they are found. These include acting as ligands for the binding of enzymes (ApoB) and as cofactors for the action of other enzymes (ApoA and ApoC).

**apomorphine** *n.* a **\*dopamine** receptor agonist used in the treatment of Parkinson's disease that is poorly controlled by **\*levodopa**. Side-effects include involuntary movements and instability of posture.

**aponeurosis** *n.* a thin but strong fibrous sheet of tissue that replaces a **\*tendon** in muscles that are flat and sheetlike and have a wide area of attachment (e.g. to bones). —**aponeurotic** *adj.*

**apophysis** *n.* **1.** a protuberance of bone to which a tendon is attached. It ossifies separately from the rest of the bone and fuses with it at maturity. **2.** a projection of any other part, e.g. of the brain (**apophysis cerebri**: the **\*pineal gland**).

**apophysitis** *n.* inflammation of an unfused **\*apophysis** resulting from excessive traction from a large tendon attachment. It most commonly occurs around the knee (see **OSGOOD-SCHLATTER DISEASE**) and the heel (see **SEVER'S DISEASE**). See also **OSTEOCHONDRITIS**.

**apoplexy** *n.* see **STROKE**.

**apoptosis** *n.* programmed cell death, which results in the ordered removal of cells and occurs naturally as part of the normal development, maintenance, and renewal of cells, tissues, and organs. During embryonic development, for example, the fingers are 'sculpted' from the embryonic spade-like hand by apoptosis of the cells between them. Defects in apoptosis, for example if it is absent or blocked, have been implicated in the uncontrolled division of malignant cells that occurs in cancer. Abnormal apoptosis, due to failure of the mechanisms that control it, may be a causative factor in autoimmune disease.

**appendectomy** *n.* the usual US term for **\*appendicectomy**.

**appendicectomy** *n.* surgical removal of the vermiform appendix. See also **APPENDICITIS**.

**appendicitis** *n.* inflammation of the vermiform **\*appendix**. The typical presentation of **acute appendicitis** is central abdominal pain, which later migrates to the right lower abdomen; other symptoms include malaise, anorexia, nausea and vomiting, and even diarrhoea. Palpation of the abdomen may reveal tenderness overlying the inflamed appendix (*see* **MCBURNEY'S POINT**). Unusual positions of the appendix may cause pain in different sites, leading to difficulty in diagnosis. Acute appendicitis is a surgical emergency requiring removal of the appendix (appendicectomy). Failure to do so may lead to abscess formation, perforation, peritonitis, life-threatening sepsis, and circulatory shock. Conditions that mimic appendicitis include mesenteric **\*lymphadenitis**, terminal ileitis (*see* **CROHN'S DISEASE**), right-sided ectopic pregnancy, a right-sided kidney stone, **\*pyelonephritis**, and (rarely) right-sided pneumonia.

**appendicular** *adj.* **1.** relating to or affecting the vermiform appendix. **2.** relating to the limbs: the **appendicular skeleton** comprises the bones of the limbs.

**appendix (vermiform appendix)** *n.* the short thin blind-ended tube, 7–10 cm long, that is attached to the end of the caecum (a pouch at the start of the large intestine). It has no known function in humans and is liable to become infected and inflamed, especially in young adults (*see* **APPENDICITIS**).

**apperception** *n.* (in psychology) the process by which the qualities of an object, situation, etc., perceived by an individual are correlated with his/her preexisting knowledge.

**apostat** *n.* a region in the brain that controls the amount of food intake. Appetite suppressants probably decrease hunger by changing the chemical characteristics of this centre.

**applanation** *n.* a method of flattening the cornea that is used to determine the intraocular pressure in applanation tonometry (*see* **TONOMETER**).

**apple-core** *adj.* describing the characteristic radiographic appearance of a **\*stricture** of the large bowel resulting from the presence of a cancer, observed in a double-contrast barium enema study. The bowel is narrow with an irregular outline and the ends of the stricture are 'shouldered', giving

the appearance of an apple core after eating the fleshy portion of the fruit. This contrasts with smooth tapering strictures, which are commonly benign.

**applicator** *n.* any device used to apply medication or treatment to a particular part of the body.

**apposition** *n.* the state of two structures, such as parts of the body, being in close contact. For example, the fingers are brought into apposition when the fist is clenched, and the eyelids when the eyes are closed.

**appraisal** *n.* formal review of a health-care professional's performance, carried out on an annual basis by a trained appraiser in order to provide feedback on past performance, chart continuing progress, and identify needs for development. For doctors, the content of the appraisal is based on the General Medical Council's document *Good Medical Practice*. See also [CLINICAL GOVERNANCE](#).

**apraclonidine** *n.* an alpha agonist (see [SYMPATHOMIMETIC](#)) administered to reduce or prevent raised intraocular pressure, especially after laser surgery.

**apraxia** *n.* an inability to make skilled movements with accuracy. This is a disorder of the [\\*cerebral cortex](#) resulting in the patient's inability to organize the movements rather than clumsiness due to weakness, sensory loss, or disease of the [\\*cerebellum](#). It is most often caused by disease of the dominant [\\*parietal lobe](#) of the brain and sometimes by disease of the frontal lobe, causing, for example, difficulty in walking (**gait apraxia**).

**aprepitant** *n.* an antiemetic drug used for the treatment of chemotherapy-induced and postoperative nausea. It blocks activation of neurokinin-1 receptors in the vomiting centres of the brain by substance P, a peptide released by chemotherapy.

**aproctia** *n.* congenital absence of the anus or its opening. See [IMPERFORATE ANUS](#).

**apronectomy** *n.* the surgical removal of excessive redundant skin and subcutaneous tissue from the front of the abdomen, usually after massive weight loss in morbidly obese patients.

**aprosexia** *n.* inability to fix the attention on any subject, due to poor eyesight, defective hearing, or mental weakness.

**APTT** activated partial thromboplastin time (*see* **PTTK**).

**APUD cells** cells that share the metabolic property of *amine-precursor uptake and decarboxylation*. They have a wide distribution, especially in the mucosa of the gastrointestinal tract and pancreas, and their function is to synthesize and release polypeptides that serve as regulator peptides and neurotransmitters. They are often known as the **diffuse neuroendocrine system**.

**apudoma** *n.* a tumour that contains **\*APUD cells** and may give rise to symptoms caused by excessive production of the hormones and other peptides that these cells produce. **\*Carcinoids** are a good example of this group of tumours, but there are many others (e.g. **\*gastrinomas**, **\*somatostatinomas**, and **\*VIPomas**).

**apyrexia** *n.* the absence of fever.

**AQP** *see* **ANY QUALIFIED PROVIDER**.

**aquaporin** *n.* any of a class of proteins that function as transmembrane water channels. Genetic mutations of aquaporin 2 (AQP-2) are responsible for some distinct forms of **\*nephrogenic diabetes insipidus**.

**aqueduct** *n.* (in anatomy) a canal containing fluid. An example is the **\*cerebral aqueduct**.

**aqueous humour** the watery fluid that fills the chamber of the **\*eye** immediately behind the cornea and in front of the lens. It is continually being formed – chiefly by capillaries of the ciliary processes – and it drains away into Schlemm's canal, at the junction of the cornea and sclera.

**aqueous misdirection (malignant glaucoma)** a rare form of secondary angle-closure **\*glaucoma** marked by raised intraocular pressure and shallowing of the central and peripheral anterior chamber.

**arachidonic acid** *see* **ESSENTIAL FATTY ACID**.

**arachnidism** *n.* poisoning from the bite of a spider. Toxins from the less venomous species of spider cause only local pain, redness, and swelling. Toxins from more venomous species, such as the black widow (*Lactrodectus mactans*), cause muscular pains, convulsions, nausea, and paralysis.

**arachnodactyly** *n.* abnormally long and slender fingers: usually associated with excessive height and congenital defects of the heart and eyes in *\*Marfan's syndrome*.

**arachnoid (arachnoid mater)** *n.* the middle of the three membranes covering the brain and spinal cord (see **MENINGES**), which has a fine, almost cobweb-like, texture. Between it and the pia mater within lies the subarachnoid space, containing cerebrospinal fluid and large blood vessels; the membrane itself has no blood supply.

**arachnoiditis** *n.* an inflammatory process causing thickening and scarring (fibrosis) of the membranous linings (*\*meninges*) of the spinal canal. The resulting entrapment of nerve roots may result in weakness, pain, and numbness in the affected area. The condition may result from infection or inflammation of the meninges, surgery, or as a response to the oil-based dyes previously used in *\*myelography*. The reaction to myelography is prevented by the current use of water-soluble dyes.

**arachnoid villus** one of the thin-walled projections outwards of the arachnoid membrane into the blood-filled sinuses of the dura, acting as a one-way valve for the flow of cerebrospinal fluid from the subarachnoid space into the bloodstream. Large villi, known as **arachnoid granulations** (or **Pacchionian bodies**), are found in the region of the superior sagittal sinus. They may be so distended as to cause pitting of the adjacent bone.

**arbor** *n.* (in anatomy) a treelike structure. **Arbor vitae** is the treelike outline of white matter seen in sections of the cerebellum; it also refers to the treelike appearance of the inner folds of the cervix (neck) of the uterus.

**arbovirus** *n.* one of a group of RNA-containing viruses that are transmitted from animals to humans by insects (i.e. arthropods; hence *arthropod-borne* viruses) and cause diseases resulting in encephalitis or serious fever, such as dengue and yellow fever.

**ARC** AIDS-related complex: see **AIDS**.

**arc-eye** *n.* a painful condition of the eyes caused by damage to the surface of the cornea by ultraviolet light from arc welding. It usually resolves if the eyes are padded for 24 hours. It is similar to **\*snow blindness** and the condition caused by overexposure of the eye to sun-tanning lamps.

**arch-** (**arche-**, **archi-**, **archo-**) *combining form denoting* first; primitive; ancestral. Example: **archinephron** (first-formed embryonic kidney).

**archenteron** *n.* a cavity that forms in the very early embryo as the result of gastrulation (*see* **GASTRULA**). In humans it forms a tubular cavity, the **archenteric canal**, which connects the amniotic cavity with the yolk sac. — **archenteric** *adj.*

**archetype** *n.* (in Jungian psychology) an inherited idea or mode of thought supposed to be present in the **\*unconscious** mind and to derive from the experience of the whole human race (the collective unconscious), not from the life experience of the individual. **Anima** is the feminine component of a male's personality; **animus** is the masculine component of a female's personality.

**archipallium** *n.* the **\*hippocampal formation** of the cerebrum. The term is seldom used.

**arcuate keratotomy** a curved incision made in the periphery of the cornea. It is usually performed in the region of greatest curvature of the cornea in order to flatten it and hence reduce **\*astigmatism**.

**arcuate uterus** an anomaly or anatomical variation in which there is a slight indentation of the endometrium at the top of the uterus. Unlike a **septate uterus**, in which the indentation extends into a septum that divides the interior of the uterus, and a **\*bicornuate** uterus, it does not normally affect reproductive function. *See also* **UTERUS DIDELPHYS**.

**arcus** *n.* an arch; for example the **arcus aortae** (**\*aortic arch**) or an **arcus senilis** or **arcus juvenilis** (*see* **CORNEAL ARCUS**).

**ARDS** *see* **ADULT RESPIRATORY DISTRESS SYNDROME**.

**areola** *n.* **1.** the brownish or pink ring of tissue surrounding the nipple of the breast. **2.** the part of the iris that surrounds the pupil of the eye. **3.** a small

space in a tissue. —**areolar** *adj.*

**areolar tissue** loose *\*connective tissue* consisting of a meshwork of collagen, elastic tissue, and reticular fibres interspersed with numerous connective tissue cells. It binds the skin to underlying muscles and forms a link between organs while allowing a high degree of relative movement.

**ARF** *see* **ACUTE RESPIRATORY FAILURE**.

**Argasidae** *n. see* **TICK**.

**argentaffin cells** cells that stain readily with silver salts. Such cells occur, for example, in the crypts of Lieberkühn in the intestine.

**arginine** *n.* an *\*amino acid* that plays an important role in the formation of *\*urea* by the liver.

**argon laser** a type of *\*laser* that utilizes argon gas to produce a beam of intense light, used especially in eye surgery to treat disease of the retina (e.g. diabetic retinopathy) or glaucoma (as in argon laser *\*trabeculoplasty*). *See also* **PHOTOCOAGULATION**.

**argon plasma coagulation** an endoscopic procedure used predominantly to control bleeding in the gastrointestinal tract. secondary to angiodysplasia and bleeding following polypectomy. Occasionally it is used in the debulking of tumours not amenable to surgery. An intermittent stream of argon gas is delivered through a catheter in the endoscope and ionized by a monopolar electrical current producing a controlled release of thermal energy. This causes coagulation in the adjacent tissues.

**Argyll Robertson pupil** a disorder of the eyes in which the *\*pupillary reflex* is absent. Although the pupils contract normally for near vision (the accommodation reflex), they fail to contract in bright light. It may occur, for example, as a result of syphilis or diabetes. [D. Argyll Robertson (1837–1909), Scottish ophthalmologist]

**argyria (argyrosis)** *n.* the deposition of silver in the skin and other tissues, either resulting from industrial exposure or following ingestion or long-term administration of silver salts. A slate-grey pigmentation develops slowly; this is accentuated in areas exposed to light. Deposition of silver in the conjunctiva, corneal epithelium, stroma, and Descemet's membrane is

usually due to chronic exposure to silver compounds or instillation of eye drops containing silver.

**ariboflavinosis** *n.* the group of symptoms caused by deficiency of riboflavin (**\*vitamin B<sub>2</sub>**). These symptoms include inflammation of the tongue and lips and sores in the corners of the mouth.

**Arimidex** *n.* *see* **AROMATASE INHIBITOR**.

**aripiprazole** *n.* *see* **ANTIPSYCHOTIC**.

**Aristolochia** *n.* a genus of plants containing aristolochic acid, a nephrotoxin associated with progressive renal failure and a tendency to urothelial tumours. Species are associated with **\*Balkan nephropathy** (*A. clematis*) and **\*Chinese herb nephropathy** (*A. fangchi*).

**ARMD** age-related **\*macular degeneration**.

**ARN** *see* **ACUTE RETINAL NECROSIS**.

**Arnold–Chiari malformation** a congenital disorder in which there is distortion of the base of the skull with protrusion of the lower brainstem and parts of the cerebellum through the opening for the spinal cord at the base of the skull (*see* **BANANA AND LEMON SIGNS**). It is associated commonly with **\*neural tube defects**, **\*hydrocephalus**, and a **\*syringomyelia**. [J. Arnold (1835–1915) and H. Chiari (1851–1916), German pathologists]

**Aromasin** *n.* *see* **AROMATASE INHIBITOR**.

**aromatase inhibitor** any one of a class of drugs used in the treatment of early and advanced oestrogen-dependent breast cancer in postmenopausal women. These drugs act by inhibiting the action of aromatase, an enzyme that promotes the conversion of testosterone to oestradiol. They therefore reduce oestrogen levels, which can be helpful in the control of oestrogen-dependent tumours. Aromatase inhibitors include **anastrozole**, **exemestane**, and **letrozole**. Side-effects include symptoms of oestrogen deficiency (e.g. hot flushes), nausea and vomiting, and headache.

**aromatherapy** *n.* a form of complementary medicine that utilizes fragrant essential oils to improve physical, psychological, and emotional wellbeing.

The oils can be massaged into the skin or their fragrances can be inhaled via an infusion.

**arousal** *n.* **1.** a state of alertness and of high responsiveness to stimuli. It is produced by strong motivation, by anxiety, and by a stimulating environment. **2.** physiological activation of the *\*cerebral cortex* by centres lower in the brain, such as the *\*reticular activating system*, resulting in wakefulness and alertness.

**arrhenoblastoma** *n.* *see* ANDROBLASTOMA.

**arrhythmia** *n.* any deviation from the normal rhythm (sinus rhythm) of the heart. Arrhythmias result from a disturbance of the generation or the conduction of electrical impulses from the *\*sinoatrial node* and may be intermittent or continuous. They are subdivided into **tachyarrhythmias** (fast rate) and **bradyarrhythmias** (slow rate). They include *\*ectopic beats* (extrasystoles), *\*re-entry tachycardia*, ectopic tachycardias (*see* SUPRAVENTRICULAR TACHYCARDIA; VENTRICULAR TACHYCARDIA), atrial and ventricular *\*fibrillation*, and *\*heart block* (which is often associated with slow heart rates). Symptoms include palpitations, breathlessness, and chest pain. In more serious arrhythmias the *\*Stokes-Adams syndrome* or *\*cardiac arrest* may occur. Arrhythmias may result from most heart diseases but they also occur without apparent cause.

**arsenic** *n.* a poisonous greyish metallic element producing the symptoms of nausea, vomiting, diarrhoea, cramps, convulsions, and coma when ingested in large doses. Drugs used as antidotes to arsenic poisoning include *\*chelating agents*. Arsenic was formerly readily available in the form of rat poison and in fly-papers and was the poisoner's first choice during the 19th century, its presence in a body being then difficult to detect. Today detection is relatively simple. Arsenic was formerly used in medicine, the most important arsenical drugs being **arsphenamine** (Salvarsan) and **neoarsphenamine**, used in the treatment of syphilis and dangerous parasitic diseases. Symbol: As.

**artefact** *n.* *see* ARTIFACT.

**artemisinin** *n.* the active ingredient of qinghaosu, a Chinese herbal medicine prepared from a species of wormwood (*Artemisia annua*) and long used for

treating malaria. Derivatives of artemisinin (including artesunate and artemether) have been developed for the treatment of malignant (*falciparum*) malaria; they act by killing the asexual stages of the parasite (*see* **PLASMODIUM**) and are used in combination with other antimalarial drugs. In the UK, for example, artemether is available in combination with lumefantrine.

**arter-** (**arteri-**, **arterio-**) *combining form denoting an artery*. Examples: **arteriopathy** (disease of); **arteriorrhaphy** (suture of); **arteriovenous** (relating to arteries and veins).

**arterial line** a narrow **\*catheter** inserted into an artery for the purposes of continuous monitoring or blood gas analysis. It is used for short periods during phases of acute or critical illness and should be clearly labelled to prevent inadvertent use as a medication conduit. The femoral, axillary, or posterior tibial arteries can be used as insertion sites.

**Arterial line.**

**arterial ulcer** a localized area of damage and breakdown of the skin due to inadequate arterial blood supply (**\*ischaemia**). Usually it is seen on the feet of patients with severe atheromatous narrowings of the arteries supplying the legs.

**arteriectomy** *n.* surgical excision of an artery or part of an artery. This may be performed as a diagnostic procedure (for example, to take an arterial biopsy in the diagnosis of arteritis) or during reconstruction of a blocked artery when the blocked segment is replaced by a synthetic graft.

**arteriogenesis** *n.* the enlargement of pre-existing collateral channels to form collateral arteries in order to bypass an occluded primary artery (*see* **COLLATERAL CIRCULATION**). This is an active process involving remodelling of the vessel wall mediated by cellular and chemical signals.

**arteriography** *n.* imaging of arteries (*see* **ANGIOGRAPHY**). The major roles of arteriography are to demonstrate the site and extent of atherosclerotic narrowing or occlusion, especially in the coronary arteries (*see* **CORONARY ANGIOGRAPHY**) and leg arteries (**peripheral arteriography**), and to demonstrate the anatomy of aneurysms within the skull (**carotid and vertebral arteriography**). This technique is also used to image a bleeding vessel prior to blocking it (*see* **EMBOLIZATION**).

**arteriole** *n.* a small branch of an **\*artery**, leading into many smaller vessels – the **\*capillaries**. By their constriction and dilation, under the regulation of the sympathetic nervous system, arterioles are the principal controllers of blood flow and pressure.

**arteriolitis** *n.* inflammation of the arterioles (the smallest arteries), which may complicate severe hypertension. This produces **necrotizing arteriolitis**, which may result in kidney failure. A similar condition may affect the lung in pulmonary hypertension.

**arteriolosclerosis** *n.* *see* **NEPHROSCLEROSIS**.

**arterioplasty** *n.* surgical reconstruction of an artery; for example, in the treatment of **\*aneurysms**.

**arteriportography (arterial portography)** *n.* an invasive imaging technique used to visualize the **\*portal vein**. A diagnostic catheter is advanced to the superior mesenteric artery or splenic artery from the common femoral artery or radial artery. X-ray contrast is injected and images are taken as this passes through the artery and returns via the veins, to opacify the portal vein. The images obtained will show the portal vein on

fluoroscopy. When it is combined with CT scanning (**CT arteriopography**), exquisite details of the portal vein and the liver will be obtained. As the liver is mainly supplied by the portal vein, this technique enhances the contrast of the normal liver and shows any abnormal areas very clearly. Tumours not seen on conventional CT scans are readily visible.

**arteriosclerosis** *n.* an imprecise term used for any of several conditions affecting the arteries. The term is often used as a synonym for atherosclerosis (*see* **ATHEROMA**).

**arteriotomy** *n.* an incision into, or a needle puncture of, the wall of an artery. This is most often performed as a diagnostic procedure in the course of **\*arteriography** or cardiac **\*catheterization**. It may also be required to remove an embolus (*see* **EMBOLECTOMY**).

**arteriovenous anastomosis** a thick-walled blood vessel that connects an arteriole directly with a venule, thus bypassing the capillaries. Arteriovenous anastomoses are commonly found in the skin of the lips, nose, ears, hands and feet; their muscular walls can constrict to reduce blood flow or dilate to allow blood through to these areas.

**arteriovenous aneurysm** a direct communication between an artery and vein, without an intervening capillary bed. It can occur as a congenital abnormality or it may be acquired following injury or surgery. It may affect the limbs, lungs, or viscera and may be single or multiple. If the connection is large, the short-circuiting of blood may produce heart failure. Large isolated arteriovenous aneurysms may be closed surgically.

**arteriovenous malformation** *see* **ANGIOMA**.

**arteritis** *n.* an inflammatory disease that affects the muscular walls of the arteries. It may be part of a **\*connective-tissue disease** or it may be due to an infection, such as syphilis. The affected vessels are swollen and tender and may become blocked. **Temporal** (or **giant-cell**) **arteritis** occurs in the elderly and most commonly affects the arteries of the scalp. The patient complains of severe headache, and double vision or scalp tenderness may be present; blindness may result from thrombosis of the arteries to the eyes. Treatment with steroid medication is rapidly effective.

**artery** *n.* a blood vessel carrying blood away from the heart. All arteries except the **\*pulmonary artery** carry oxygenated blood. The walls of arteries contain smooth muscle fibres, which contract or relax under the control of the sympathetic nervous system. See illustrations. *See also* **AORTA**; **ARTERIOLE**.

**Transverse section through an artery.**

### The principal arteries of the body.

**arthr-** (**arthro-**) *combining form denoting a joint.* Examples: **arthrology** (science of); **arthrosclerosis** (stiffening or hardening of).

**arthralgia** (**arthrodynia**) *n.* severe ache or pain in a joint, without swelling or other signs of arthritis. *Compare* **ARTHRITIS**.

**arthrectomy** *n.* surgical excision of a joint. It is usually performed on a painful joint that has ceased to function, as may result from intractable infection, or after a failed joint replacement. *See also* **ARTHROPLASTY**.

**arthritis** *n.* inflammation of one or more joints, characterized by pain, swelling, warmth, redness of the overlying skin, and diminished range of joint motion. There are four basic subgroups of arthritis: **noninflammatory arthritis**, including **\*osteoarthritis**, **\*neuropathic arthritis**, and **\*osteochondritis dissecans**; **inflammatory arthritis**, including **\*rheumatoid arthritis**, **\*gout**, **\*psoriatic arthritis**, and **\*juvenile idiopathic arthritis**; **infectious arthritis**, including **\*septic arthritis**; and **haemorrhagic arthritis**, including haemophilic arthritis (which occurs in patients with haemophilia). Arthritis may be **monoarticular** (involving one joint), **pauciarticular** (involving four or fewer joints), or **polyarticular** (involving five or more joints, either simultaneously or in sequence). Diagnosis is based on clinical and laboratory findings, including X-rays, blood tests, and where necessary analysis of synovial fluid obtained by **\*arthrocentesis**. Treatment is specific for each subgroup and may include any combination of supportive measures with activity modification, analgesics, anti-inflammatory medications (e.g. **\*NSAIDs**), **\*disease-modifying antirheumatic drugs** (DMARDs), corticosteroids, and surgical procedures, such as joint replacement (*see* **ARTHROPLASTY**). —**arthritic** *adj.*

- Website of Versus Arthritis (a merger of the former Arthritis Care and Arthritis Research): advice on living with arthritis together with

the latest research into the causes, treatment, and cure of the condition

**arthrocentesis** *n.* aspiration (removal) of fluid from a joint through a puncture needle into a syringe.

**arthrodesis** *n.* artificial ankylosis: the fusion of bones across a joint space by surgical means, in order to eliminate movement. This operation is performed when a joint is very painful, highly unstable, grossly deformed or chronically infected, or when an **\*arthroplasty** would be inadvisable or impossible. *See also* **CHARNLEY CLAMPS**.

**arthrodic joint (gliding joint)** a form of **\*diarthrosis** (freely movable joint) in which the bony surfaces slide over each other without angular or rotational movement. Examples are the joints of the carpus and tarsus.

**arthrodynia** *n.* *see* **ARTHRALGIA**.

**arthrography** *n.* an imaging technique for examining joints. A contrast medium (either **\*radiolucent** gas or a **\*radiopaque** material) is injected into the joint space, outlining its contents and extent accurately. Conventional arthrography has now largely been replaced by magnetic resonance arthrography (MR arthrography; *see* **MAGNETIC RESONANCE IMAGING**).

**arthrogryposis** *n.* congenital limitation of joint movement due to **\*contractures** affecting two or more joints. This is accompanied by joint stiffness, cylindrical limbs, and absence of skin creases. The most common of such syndromes is **arthrogryposis multiplex congenita**, a congenital condition of multiple contractures in which muscles are replaced by fibrous tissue, resulting in narrow limbs. Treatment, which begins soon after birth, consists initially of manipulation and splintage of deformed joints followed by contracture release and osteotomies.

**arthropathy** *n.* any disease or disorder involving a joint.

**arthroplasty** *n.* surgical refashioning of a diseased joint to relieve pain and to maintain or regain movement. An **excision** (or **resection**) **arthroplasty** involves the excision of enough bone to create a gap at which movement can occur. In an **interposition arthroplasty** a biological or artificial barrier is placed between the two bony surfaces. In a **total arthroplasty** both joint

surfaces are replaced by [\\*prostheses](#); in a **hemiarthroplasty**, performed for some fractures of the hip and shoulder, only one end of a joint is replaced.

**arthropod** *n.* any member of a large group of animals that possess a hard external skeleton and jointed legs and other appendages. Many arthropods are of medical importance, including the [\\*mites](#), [\\*ticks](#), and [\\*insects](#).

**arthroscope** *n.* a rigid telescope fitted with a lens system and fiberoptic illumination that is inserted into a joint through a small ('keyhole') incision and generates a magnified picture of the joint interior that can be viewed on a television monitor. The diameter of arthroscopes ranges from 2 mm for small joints to 5 mm for larger joints.

**arthroscopy** *n.* inspection of a joint cavity with an [\\*arthroscope](#), enabling percutaneous surgery (such as [\\*meniscectomy](#)) and [\\*biopsy](#) to be performed.

**arthrostomy** *n.* a procedure to enable a temporary opening to be made into a joint cavity.

**arthrotomy** *n.* the surgical opening of any joint. It is performed to allow joint inspection, removal of a loose body, drainage of pus (from an infected joint) or of a haematoma, synovectomy, joint reconstruction, or joint replacement.

**articaine** *n.* an amide-type local [\\*anaesthetic](#) used in dentistry. With a lower pKa of 7.8 (more rapid onset) and high lipid solubility (depth of anaesthesia), it is of significant benefit when infection is present. It also has the ability to penetrate bone. Although a causal relationship has not been proven, articaine has been associated with a higher risk of nerve damage when used as a block technique.

**articular** *adj.* relating to a joint. For example, **articular cartilage** is the layer of cartilage at the ends of adjoining bones at a joint. *See also* [EXTRA-ARTICULAR](#); [INTRA-ARTICULAR](#); [PERIARTICULAR](#).

**articulation** *n.* (in anatomy) the point or type of contact between two bones. *See* [JOINT](#).

**articulator** *n.* (in dentistry) an apparatus for relating the upper and lower models of a patient's dentition in a fixed position, usually with maximum

tooth contact. Some articulators can reproduce jaw movements. They are used in the construction of crowns, bridges, and dentures.

**artifact (artefact)** *n.* **1.** (in radiography) an appearance on an image that is not a true representation of the patient's body part. The cause may be a problem with the radiographic technique or something more straightforward. For example, a movement artifact is blurring of the image due to movement of the patient or organ during the exposure. All imaging techniques, including CT and MRI, are susceptible to a range of artifacts. *See also* **PARTIAL VOLUME ARTIFACT**. **2.** (in microscopy) a structure seen in a tissue under a microscope that is not present in the living tissue. Artifacts, which are produced by faulty **\*fixation** or staining of the tissue, may give a false impression that disease or abnormality is present in the tissue when it is not.

**artificial heart** *see* **VENTRICULAR ASSIST DEVICE**.

**artificial insemination** instrumental introduction of semen into the vagina in order that a woman may conceive. Insemination is timed to coincide with the day on which the woman is expected to ovulate (*see* **MENSTRUAL CYCLE**). The semen specimen may be provided by the husband (AIH – **artificial insemination husband**), for example in cases of erectile dysfunction, or by an anonymous donor (**DI – donor insemination**), usually in cases where the husband is sterile.

**artificial nutrition and hydration** the use of enteral feeding tubes or cannulas to administer nutrients and fluids directly into the gastrointestinal tract or bloodstream when the oral route cannot be used owing to disability or disease. When other intensive treatments are judged **\*futile**, artificial nutrition and hydration are considered **\*extraordinary means** of prolonging life in patients who have no prospect of recovery. It is permissible to withdraw such treatment when it is no longer in the patient's interests and when the primary intention is not to kill the patient, although death is foreseen (*see* **DOCTRINE OF DOUBLE EFFECT**). In cases of patients in a **\*persistent vegetative state** in England and Wales, the matter must be referred to the courts following the case of Tony Bland. Where food and water are withdrawn it is still considered important to moisten the patient's lips and to keep him or her comfortable until death.

**artificial respiration (artificial ventilation)** an emergency procedure for maintaining a flow of air into and out of a patient's lungs when the natural breathing reflexes are absent or insufficient. This may occur after drowning, poisoning, etc., or during a surgical operation on the thorax or abdomen when muscle-relaxing drugs are administered. The simplest and most efficient method is **\*mouth-to-mouth resuscitation**. In hospital the breathing cycle is maintained by means of a **\*ventilator**.

**artificial rupture of membranes (ARM)** *see* **AMNIOTOMY**.

**artificial sphincter** an apparatus designed to replace or support a **\*sphincter** that is either absent or ineffective. *See also* **NEOSPHINCTER**.

**ARV** *see* **ANTIRETROVIRAL DRUG**.

**arytenoid cartilage** either of the two pyramid-shaped cartilages that lie at the back of the **\*larynx** next to the upper edges of the cricoid cartilage.

**arytenoidectomy** *n.* surgical excision of the arytenoid cartilage of the larynx in the treatment of paralysis of the vocal folds.

**ASA classification** a widely used classification for grading patients' fitness for surgery prior to the operation. It was developed by the American Society of Anesthesia (ASA), but is now used worldwide. Patients are assigned grades between 1 and 6.

**asbestosis** *n.* a lung disease – a form of **\*pneumoconiosis** – caused by fibres of asbestos inhaled by those who are exposed to the mineral. The incidence of lung cancer is high in such patients, particularly if they smoke cigarettes (*see also* **MESOTHELIOMA**). Asbestosis does not include **\*asbestos-related pleural disease**. This is important because patients with asbestosis due to occupational exposure can often claim compensation, whereas this is only rarely possible for those with asbestos-related pleural disease.

**asbestos-related pleural disease** any one of a variety of conditions involving the **\*pleura**, but not the lungs (*see* **ASBESTOSIS**), in subjects exposed to asbestos. These include the formation of pleural plaques, diffuse pleural thickening, and pleural effusions (*see* **OEDEMA**).

**A-scan** *n.* examination of ocular tissue, including measurement of the length of the eye (axial length), by means of a high-frequency ultrasound machine. *See also* **B-SCAN**.

**ascariasis** *n.* a disease caused by an infestation with the parasitic worm *\*Ascaris lumbricoides*. Adult worms in the intestine can cause abdominal pain, vomiting, constipation, diarrhoea, appendicitis, and peritonitis; in large numbers they may cause obstruction of the intestine. The presence of the migrating larvae in the lungs can provoke pneumonia. Ascariasis occurs principally in areas of poor sanitation; it is treated with *\*levamisole*.

**Ascaris** *n.* a genus of parasitic nematode worms. *A. lumbricoides*, widely distributed throughout the world, is the largest of the human intestinal nematodes – an adult female measures up to 35 cm in length. Eggs, passed out in the stools, may be transmitted to a new host in contaminated food or drink. Larvae hatch out in the intestine and then undergo a complicated migration, via the hepatic portal vein, liver, heart, lungs, windpipe, and pharynx, before returning to the intestine where they later develop into adult worms (*see also* **ASCARIASIS**).

**ascites (hydroperitoneum)** *n.* the accumulation of fluid in the peritoneal cavity, causing abdominal swelling. Causes include infections (such as tuberculosis), heart failure, *\*portal hypertension*, *\*cirrhosis*, and various cancers (particularly of the ovary and liver): the presence of malignant cells in the fluid, revealed by cytological examination, is usually evidence of secondary spread. Obstruction to the drainage of lymph from the abdomen results in **chylous ascites** (*see* **CHYLE**). **Pancreatic ascites**, due to direct communication between the pancreatic duct and the peritoneal cavity, usually following trauma or severe pancreatitis, is diagnosed by very high amylase levels in aspirated ascitic fluid. Treatment includes diuretics and ascitic drainage (paracentesis) if there is associated respiratory distress. *See also* **OEDEMA**.

**ascorbic acid** *see* **VITAMIN C**.

**ASD** *see* **ATRIAL SEPTAL DEFECT**.

**-ase** *suffix denoting an enzyme*. Examples: **lactase**; **dehydrogenase**.

**asepsis** *n.* the complete absence of bacteria, fungi, viruses, or other microorganisms that could cause disease. Asepsis is the ideal state for the performance of surgical operations and is achieved by using **\*sterilization** techniques. —**aseptic** *adj.*

**Asherman syndrome** a condition in which **\*amenorrhoea** and infertility follow a major haemorrhage in pregnancy. It may result from overvigorous curettage of the uterus in an attempt to control the bleeding. This removes the lining, the walls adhere, and the cavity is obliterated to a greater or lesser degree. Some 50% of such patients are subsequently infertile, and of those who become pregnant, only a minority achieve an uncomplicated delivery. *Compare SHEEHAN'S SYNDROME.* [J. G. Asherman (20th century), Czechoslovakian gynaecologist]

**ash-leaf macules** impalpable pale spots that may be seen anywhere on the body and are a cutaneous sign of **\*tuberous sclerosis**. Identification is facilitated by examination of the skin with an ultraviolet light source (**\*Wood's light**).

**Askanazy cells** *see* **HÜRTHLE CELL TUMOUR.**

**asparaginase** *n.* an enzyme that inhibits the growth of certain tumours. **Crisantaspase**, the form produced by the bacterium *Erwinia chrysanthemi*, is used in the treatment of acute lymphoblastic leukaemia.

**asparagine** *n. see* **AMINO ACID.**

**aspartame** *n.* an artificial sweetener (E951) 200 times sweeter than sugar. Aspartame is metabolized by the body into its constituents – aspartic acid, phenylalanine, and methanol – and is therefore not suitable for people with **\*phenylketonuria**. It can be used in diabetic foods.

**aspartate aminotransferase (AST)** an enzyme involved in the transamination of amino acids. Measurement of AST in the serum may be used in the diagnosis of acute myocardial infarction and acute liver disease. It was formerly called **serum glutamic oxaloacetic transaminase (SGOT)**.

**aspartic acid (aspartate)** *see* **AMINO ACID.**

**Asperger's syndrome** a condition considered to be a mild form of \*autism, characterized by social aloofness, a limited range of interests, stilted and pedantic styles of speech, and an excessive preoccupation with a very specialized interest (such as timetables). Intelligence can be normal or enhanced, but is more commonly in the lower average range. [H. Asperger (1906–80), Austrian paediatrician]

**aspergillosis** *n.* a group of conditions caused by fungi of the genus *Aspergillus*, usually *Aspergillus fumigatus*. These conditions nearly always arise in patients with pre-existing lung disease and fall into three categories. The allergic form most commonly affects asthmatic patients and may cause collapse of segments or lobes of a lung. The colonizing form leads to formation of a fungus ball (**aspergilloma**), usually within a pre-existing cavity in the lung (such as an emphysematous \***bull**a or a healed tuberculous cavity). Similar fungus balls may be found in other cavities, such as the eye or the sinuses around the nose. The third form of aspergillosis, in which the fungus spreads throughout the lungs and may even disseminate throughout the body, is rare but potentially fatal. It is usually associated with deficiency in the patient's immunity.

**Aspergillus** *n.* a genus of fungi, including many common moulds, some of which cause infections of the respiratory system in humans. The species *A. fumigatus* causes \*aspergillosis. *A. niger* is commonly found in the external ear and can become pathogenic.

**aspermia** *n.* strictly, a lack or failure of formation of semen. More usually, however, the term is used to mean the total absence of sperm from the semen (see AZOOSPERMIA).

**asphyxia** *n.* suffocation: a life-threatening condition in which oxygen is prevented from reaching the tissues by obstruction of or damage to any part of the respiratory system. Drowning, choking, and breathing poisonous gas all lead to asphyxia. Unless the condition is remedied by removing the obstruction (when present) and by artificial respiration if necessary, there is progressive \*cyanosis leading to death. Brain cells cannot live for more than about four minutes without oxygen.

**aspiration** *n.* the withdrawal of fluid from the body by means of suction using an instrument called an **aspirator**. There are various types of aspirator: some

employ hollow needles for removing fluid from cysts, inflamed joint cavities, etc.; another kind is used to suck debris and water from the patient's mouth during dental treatment. *See also* [VACUUM ASPIRATION](#).

**aspiration cytology** the [\\*aspiration](#) of specimens of cells from tumours or cysts through a hollow needle, using a syringe, and their subsequent examination under the microscope after suitable preparation (by staining, etc.). The technique is now used widely, especially for superficial cysts or tumours, and has become a specialized branch of diagnostic pathology. *See also* [FINE-NEEDLE ASPIRATION CYTOLOGY](#).

**aspirin (acetylsalicylic acid)** *n.* a drug that relieves pain and also reduces inflammation and fever. Largely superseded by modern anti-inflammatory agents (*see* [NSAID](#)), aspirin is now most commonly taken regularly in low doses as an [\\*antiplatelet drug](#). In this role it reduces the risk of vascular thrombosis that may lead to events such as heart attack or stroke. Aspirin works by inhibiting the production of [\\*prostaglandins](#); it may irritate the lining of the stomach, causing nausea, vomiting, pain, and bleeding. High doses cause dizziness, disturbed hearing, mental confusion, and overbreathing (*see* [SALICYLISM](#)). Aspirin has been implicated as a cause of [\\*Reye's syndrome](#) and should therefore not be given to children below the age of 16 years unless specifically indicated by a physician. *See also* [ANALGESIC](#).

**assay** *n.* a test or trial to determine the strength of a solution, the proportion of a compound in a mixture, the potency of a drug, or the purity of a preparation. *See also* [BIOASSAY](#).

**assent** *n.* agreement to undergo medical treatment sought from an adult or child who lacks capacity to [\\*consent](#). More generally, permission from patients with capacity, but whose autonomy is constrained, given to their doctor to act in their [\\*best interests](#). Assent has ethical but not legal force. In medical research, particularly with children over seven years, it is difficult to justify proceeding without assent, since research is not principally and inevitably in the patient's best interests.

**assertive outreach team (AOT)** a multidisciplinary psychiatric team specialized in the treatment of patients with severe mental illness who are

difficult to engage. Most AOTs will only see patients who have had a number of recent hospital admissions ('revolving door' patients). Recently, in many areas of the UK AOTs have been subsumed into *\*community mental health* teams.

**assimilation** *n.* the process by which food substances are taken into the cells of the body after they have been digested and absorbed.

**assisted living** a situation in which older adults reside in their own flats or units in a facility where they receive help with tasks of daily living (e.g. bathing, dressing).

**assisted suicide** the act of helping a patient to commit suicide by giving them the means (e.g. drugs) to do so. Aiding and abetting a suicide is a criminal offence in England and Wales by virtue of the Suicide Act 1961, section 2. Guidance on whether those who assist terminally ill patients in suicide – e.g. by accompanying people to jurisdictions where euthanasia is lawful, such as Switzerland – would be prosecuted for this offence, issued by the Director of Public Prosecutions in 2010, lists 6 'public interest factors' against and 16 in favour of prosecution. Those against include that the person assisted had reached a voluntary, clear, settled and informed decision to commit suicide and that the person assisting them was wholly motivated by compassion. Those factors in favour of prosecution include that the person assisting was acting in his or her capacity as a medical doctor, nurse, or other caring or custodial professional. For doctors to respect the decision of a patient with capacity to refuse life-saving or life-preserving treatment, however, is not legally regarded as assisted suicide. *See also* *EUTHANASIA*.

<https://www.cps.gov.uk/legal-guidance/suicide-policy-prosecutors-respect-cases-encouraging-or-assisting-suicide>

- Guidance from the Director of Public Prosecutions for prosecutors in cases of assisted suicide

**assistive listening device** a device for helping people with hearing difficulties. An assistive listening device can be a stand-alone device or can work in conjunction with a *\*hearing aid* or *\*cochlear implant*. Assistive listening devices include *\*induction loop systems*, amplifiers for telephones,

and radio headphones to wear when listening to the radio or television. Such devices increase the loudness of the desired sound without increasing the level of any background noise; i.e. they improve the signal-to-noise ratio. *See also* [ENVIRONMENTAL HEARING AID](#).

**association area** an area of [\\*cerebral cortex](#) that lies away from the main areas that are concerned with the reception of sensory impulses and the start of motor impulses but is linked to them by many neurons known as **association fibres**. The areas of association are thought to be responsible for the elaboration of the information received by the primary sensory areas and its correlation with the information fed in from memory and from other brain areas. They are thus responsible for the maintenance of many higher mental activities. *See also* [BODY IMAGE](#).

**association of ideas** (in psychology) linkage of one idea to another in a regular way according to their meaning. In **free association** the linkage of ideas arising in dreams or fantasy may be used to discover the underlying motives of the individual. In **word association tests** stimulus words are produced to which the subject has to respond as quickly as possible. *See also* [LOOSENING OF ASSOCIATIONS](#).

**ASSR** *see* [AUDITORY STEADY STATE RESPONSE](#).

**AST** *see* [ASPARTATE AMINOTRANSFERASE](#).

**astasia-abasia** *see* [ABASIA](#).

**aster** *n.* a star-shaped object in a cell that surrounds the [\\*centrosome](#) during mitosis and meiosis and is concerned with the formation of the [\\*spindle](#).

**astereognosis** *n. see* [AGNOSIA](#).

**asteroid hyalosis** **1.** a degenerative condition, formerly known as **asteroid hyalitis**, in which tiny deposits of calcium are suspended in the vitreous humour. They are more commonly seen in the elderly and usually cause no decrease in vision. **2.** *see* [SYNCHYSIS SCINTILLANS](#).

**asthenia** *n.* weakness or loss of strength.

**asthenopia** *n. see* [EYESTRAIN](#).

**asthenospermia** *n.* *see* OLIGOSPERMIA.

**asthma** *n.* the condition of subjects with widespread narrowing of the bronchial airways, which changes in severity over short periods of time (either spontaneously or under treatment) and leads to cough, wheezing, and difficulty in breathing. **Bronchial asthma** may be precipitated by exposure to one or more of a wide range of stimuli, including *\*allergens*, drugs (such as aspirin and other NSAIDs and beta blockers), exertion, emotion, infections, and air pollution. The onset of asthma is usually early in life and in atopic subjects (*see* ATOPY) may be accompanied by other manifestations of hypersensitivity, such as hay fever and dermatitis; however, the onset may be delayed into adulthood or even middle or old age. Treatment is with *\*bronchodilators*, with or without corticosteroids, usually administered via aerosol or dry-powder inhalers, or – if the condition is more severe – via a nebulizer. Oral corticosteroids are reserved for those patients who fail to respond adequately to these measures. Severe asthmatic attacks may need large doses of oral corticosteroids (*see* STATUS ASTHMATICUS). Selection of treatment for individual cases is made using stepped guidelines issued by respiratory organizations, e.g. the British and American Thoracic Societies and the European Respiratory Society. A new group of drug treatments, using *\*monoclonal antibodies* to target components in the allergic response, have recently become available (*see* OMALIZUMAB). Avoidance of known allergens, especially the house dust mite, allergens arising from domestic pets, and food additives, will help to reduce the frequency of attacks, as will the discouragement of smoking.

**Cardiac asthma** occurs in left ventricular heart failure and must be distinguished from bronchial asthma, as the treatment is quite different. — **asthmatic** *adj.*

<https://www.asthma.org.uk/>

- Website of Asthma UK

**astigmatism** *n.* a defect of vision in which the image of an object is distorted because not all the light rays come to a focus on the retina. Some parts of the object may be in focus but light from other parts may be focused in front of or

behind the retina. This is usually due to irregular curvature of the cornea and/or lens (*see* [REFRACTION](#)), whose surface resembles part of the surface of an egg (rather than a sphere). The defect can be corrected by wearing **cylindrical lenses** (or **cylinders**), which produce exactly the opposite degree of distortion and thus cancel out the distortion caused by the eye itself. — **astigmatic** *adj.*

**astragalus** *n. see* [TALUS](#).

**astringent** *n.* a drug that causes cells to shrink by precipitating proteins from their surfaces. Astringents are used in lotions to harden and protect the skin and to reduce bleeding from minor abrasions. They are also used in mouth washes, throat lozenges, eye drops, etc., and in antiperspirants.

**astrocyte (astroglial cell)** *n.* a type of cell with numerous sheet-like processes extending from its cell body, found throughout the central nervous system. It is one of the several different types of cell that make up the [\\*glia](#). The cells have been ascribed the function of providing nutrients for neurons and possibly of taking part in information storage processes.

**astrocytoma** *n.* a brain tumour derived from non-nervous cells ([\\*glia](#)), which – unlike the neurons – retain the ability to reproduce themselves by mitosis. All grades of malignancy occur, from slow-growing tumours whose histological structure resembles normal glial cells, to rapidly growing highly invasive tumours whose cell structure is poorly differentiated (including **anaplastic astrocytoma** and [\\*glioblastoma](#)). In adults astrocytomas are usually found in the cerebral hemispheres but in children they also occur in the cerebellum.

**asymbolia** *n. see* [ALEXIA](#).

**asymmetric septal hypertrophy (ASH)** *see* [HYPERTROPHIC CARDIOMYOPATHY](#).

**asymmetric tonic neck reflex** a primitive reflex that is present from birth but should disappear by six months of age. If the infant is lying on its back and the head is turned to one side, the arm and leg on the side to which the head is turned should straighten, and the arm and leg on the opposite side

should bend (the ‘fencer’ position). Persistence of the reflex beyond six months is suggestive of *\*cerebral palsy*.

**asymptomatic** *adj.* not showing any symptoms of disease, whether disease is present or not.

**asynclitism** *n.* tilting of the fetal skull towards one or other shoulder causing the top of the skull to be either nearer to the sacrum (**anterior asynclitism** or **Naegele’s obliquity**) or nearer to the pubis (**posterior asynclitism** or **Litzmann’s obliquity**). These mechanisms enable the fetal head to pass more easily through the maternal pelvis.

**asystole** *n.* a condition in which the heart no longer beats, accompanied by the absence of complexes in the *\*electrocardiogram*. The clinical features, causes, and treatment are those of *\*cardiac arrest*.

**atavism** *n.* the phenomenon in which an individual has a character or disease known to have occurred in a remote ancestor but not in his parents.

**ataxia** *n.* the shaky movements and unsteady gait that result from the brain’s failure to regulate the body’s posture and the strength and direction of limb movements. In **cerebellar ataxia**, due to disease of the *\*cerebellum*, there is clumsiness of willed movements. The patient staggers when walking; he or she cannot pronounce words properly and may have *\*nystagmus*. The common causes are alcohol, drugs (e.g. phenytoin), multiple sclerosis, hereditary degenerative conditions, and *\*paraneoplastic syndromes*. **Friedreich’s ataxia** is an inherited disorder appearing first in adolescence. It has the features of cerebellar ataxia, together with spasticity of the limbs. The unsteady movements of **sensory ataxia**, caused by disease of the sensory nerves, are exaggerated when the patient closes his eyes (see **ROMBERG’S SIGN**). See also **ATAXIA TELANGIECTASIA**; **TABES DORSALIS**. —**ataxic** *adj.*

**ataxia telangiectasia** an inherited (autosomal *\*recessive*) neurological disorder. *\*Ataxia* is usually noted early in life, and a key feature is the presence of dilated blood vessels visible in the sclerae of the eyes and on the cheeks and ears. Other symptoms may include slow slurred speech, abnormal eye movements, skin lesions, and immune deficiency. Affected individuals may develop malignant disease. A raised level of *\*alpha-fetoprotein* is found in the blood.

**atel-** (**atelo-**) *combining form denoting imperfect or incomplete development.* Examples: **atelencephaly** (of the brain); **atelocardia** (of the heart).

**atelectasis** *n.* failure of part of the lung to expand. This occurs when the cells lining the air sacs (alveoli) are too immature, as in premature babies, and unable to produce the wetting agent (surfactant) with which the surface tension between the alveolar walls is overcome. It also occurs when the larger bronchial tubes are blocked from within by retained secretions, inhaled foreign bodies, or bronchial cancers, or from without by enlarged lymph nodes, such as are found in patients with tuberculosis and lung cancers. The lung can usually be helped to expand by physiotherapy and removal of the internal block (if present) via a **\*bronchoscope**, but prolonged atelectasis becomes irreversible.

**ateleiosis** *n.* failure of sexual development owing to lack of pituitary hormones. *See* **INFANTILISM**; **DWARFISM**.

**atenolol** *n.* a cardioselective **\*beta blocker** used to treat angina, high blood pressure, and irregular heart rhythms. Side-effects are fatigue, depression, and digestive upsets.

**atherectomy** excision or destruction of **\*atheroma** within an artery using equipment introduced by **\*catheter**. **Directional atherectomy** involves the use of a device with an incising blade that can be directed to one side of the artery at a time. **Rotational atherectomy (rotablation)** is achieved with a diamond-tipped drill (burr) that rotates at up to 185,000 times per minute.

**atheroembolic renal disease** a disease associated with diffuse atherosclerosis and sloughing of atheromatous plaques in the aorta and main renal arteries. This results in occlusion of smaller arteries and arterioles downstream within the kidney, with ischaemic and inflammatory reactions. This leads to the onset of renal impairment. Precipitating factors include invasive procedures with aortic cannulae, vascular surgery, and therapy with thrombolytics or anticoagulants. Less commonly the condition can occur spontaneously.

**atheroma** *n.* degeneration of the walls of the arteries due to the formation in them of fatty plaques and scar tissue. This limits blood circulation and

predisposes to thrombosis. A diet rich in animal fats (*see* [CHOLESTEROL](#)) and refined sugar, cigarette smoking, obesity, and inactivity are the principal causes. Individuals with diabetes, hypertension, or a family history of early atheroma are particularly predisposed to the condition. It may be symptomless but often causes complications from arterial obstruction in middle and late life (such as angina pectoris, heart attack, stroke, and gangrene). Treatment is by prevention, but some symptoms may be ameliorated by drug therapy (e.g. angina by glyceryl trinitrate), by surgical bypass of the arterial obstruction, or by *\*atherectomy*. —**atheromatous** *adj.*

**atherosclerosis** *n.* a disease of the arteries in which fatty plaques develop on their inner walls, with eventual obstruction of blood flow. *See* [ATHEROMA](#). —**atherosclerotic** *adj.*

**athetosis** *n.* a writhing involuntary movement especially affecting the hands, face, and tongue. It is usually a form of *\*cerebral palsy*. It impairs the child's ability to speak or use his hands; intelligence is often unaffected. Such movements may also be caused by drugs used to treat *\*parkinsonism* or by the phenothiazines (*see also* [DYSKINESIA](#)). —**athetotic** *adj.*

**athlete's foot** a fungal infection of the skin between the toes: a type of *\*ringworm*. Medical name: **tinea pedis**.

**athyreosis** *n.* absence of or lack of function of the thyroid gland, causing *\*cretinism* in infancy and *\*myxoedema* in adult life.

**atlas** *n.* the first *\*cervical* vertebra, by means of which the skull is articulated to the backbone.

**ATLS** advanced trauma life support: *see* [ADVANCED LIFE SUPPORT](#).

**ATN** *see* [ACUTE TUBULAR NECROSIS](#).

**atomoxetine** *n.* a CNS *\*stimulant* used for the treatment of attention-deficit/hyperactivity disorder in children and adolescents. Side-effects include anorexia, dry mouth, gastrointestinal upsets, palpitation, and sleep disturbance, and there is a small risk of suicidal thoughts and behaviour.

**atony** *n.* a state in which muscles are floppy, lacking their normal elasticity. —**atonic** *adj.*

**atopen** *n.* any substance responsible for **\*atopy**.

**atopy** *n.* a form of **\*allergy** in which there is a hereditary or constitutional tendency to develop hypersensitivity reactions (e.g. hay fever, allergic asthma, atopic **\*eczema**) in response to allergens (**atopens**). Individuals with this predisposition – and the conditions provoked in them by contact with allergens – are described as **atopic**.

**atorvastatin** *n.* a drug used to reduce abnormally high levels of cholesterol and other lipids in the blood (*see* **STATIN**). Side-effects include insomnia, abdominal pain, flatulence, diarrhoea, and nausea.

**atosiban** *n.* *see* **TOCOLYTIC**.

**ATP (adenosine triphosphate)** a compound that contains adenine, ribose, and three phosphate groups and occurs in cells. The chemical bonds of the phosphate groups store energy needed by the cell, for muscle contraction; this energy is released when ATP is split into ADP or AMP. ATP is formed from ADP or AMP using energy produced by the breakdown of carbohydrates or other food substances. *See also* **MITOCHONDRION**.

**atracurium besilate** a nondepolarizing **\*muscle relaxant** administered during anaesthesia or intensive care. Side-effects including flushing and an increase in heart rate.

**atresia** *n.* **1.** congenital absence or abnormal narrowing of a body opening. *See* **BILIARY ATRESIA**; **DUODENAL ATRESIA**; **TRICUSPID ATRESIA**. **2.** the degenerative process that affects the majority of ovarian follicles. Usually only one Graafian follicle will ovulate in each menstrual cycle. —**atretic** *adj.*

**atri- (atrio-)** *combining form denoting* an atrium, especially the atrium of the heart. Example: **atrioventricular** (relating to the atria and ventricles of the heart).

**atrial fibrillation** *see* **FIBRILLATION**.

**atrial natriuretic peptide (ANP)** *see* **NATRIURETIC PEPTIDE**.

**atrial septal defect (ASD)** a congenital defect of the heart in which there is a hole in the partition (septum) separating the two atria (see **SEPTAL DEFECT**). There are two kinds of ASD – **ostium primum** and **ostium secundum**. Ostium primum defects are rarer but more serious as the defect lies low down near the valves of the heart. Affected children often have heart failure, although in some a heart murmur detected at routine medical examinations is the only indication of the defect. Ostium secundum defects lie away from the valves and most children have no symptoms; the defect is most commonly indicated by the detection of a heart murmur, and may not be apparent until adulthood. Most persisting ostium secundum defects can now be treated with an umbrella-shaped closure device passed to the heart through the venous system under X-ray and ultrasound control. Ostium primum defects still require surgical closure.

Intrauterine surgical techniques now enable a fetus in which an ASD has been detected to proceed to full term by using the placental circulation as a substitute for the **\*extracorporeal** circulation that would otherwise be required.

**atrioventricular bundle (AV bundle, bundle of His)** a bundle of modified heart muscle fibres (**Purkinje fibres**) passing from the **\*atrioventricular node** forward to the septum between the ventricles, where it divides into right and left bundles, one for each ventricle. The fibres transmit contraction waves from the atria, via the AV node, to the ventricles.

**atrioventricular nodal re-entry tachycardia (AVNRT)** **\*re-entry tachycardia** arising from the presence of an abnormal electrical connection between atria and ventricles situated within the **\*atrioventricular node**.

**atrioventricular node (AV node)** a mass of modified heart muscle situated in the lower middle part of the right atrium. It receives the impulse to contract from the **\*sinoatrial node**, via the atria, and transmits it through the **\*atrioventricular bundle** to the ventricles.

**atrioventricular reciprocating tachycardia (AVRT)** **\*re-entry tachycardia** arising from the presence of an abnormal electrical connection between atria and ventricles situated outside the **\*atrioventricular node**. See **ACCESSORY PATHWAY**.

**at-risk register** *see* CHILD PROTECTION REGISTER.

**atrium** *n.* (*pl.* **atria**) **1.** either of the two upper chambers of the **\*heart**. Their muscular walls are thinner than those of the ventricles; the left atrium receives oxygenated blood from the lungs via the pulmonary vein; the right atrium receives deoxygenated blood from the venae cavae. *See also* **AURICLE**. **2.** any of various anatomical chambers into which one or more cavities open. — **atrial** *adj.*

**atrophic vaginitis** *see* VAGINITIS.

**atrophy** *n.* the wasting away of a normally developed organ or tissue due to degeneration of cells. This may be physiological or pathological. Physiological atrophy occurs during embryonic life and the neonatal period (web spaces, notochord, umbilical vessels), in adolescence (the thymus), in adult life (the **\*corpus luteum** during the menstrual cycle), and in a variety of organs and tissues in old age. Pathological atrophy may occur through starvation, disuse, denervation, abnormal hormonal stimulation, lack of hormonal stimulation, or ischaemia. **Muscular atrophy** is associated with various diseases, such as poliomyelitis.

**atropine** *n.* an **\*antimuscarinic** drug that occurs in deadly nightshade (*see* **BELLADONNA**). Because it dilates the pupil and paralyses the ciliary muscle (*see* **CYCLOPLEGIA**; **MYDRIATIC**), atropine is used in eye examinations and the treatment of anterior **\*uveitis**. It is also administered by injection to treat a slow heart rate (**\*bradycardia**) associated with arrhythmias or, with **\*neostigmine**, to reverse the action of muscle relaxants used during surgery. It is sometimes used to treat gut spasms and – rarely – for **\*premedication**. Common side-effects include dryness of the throat, thirst, impaired vision, and increased heart rate.

**attachment** *n.* **1.** (in psychology) the process of developing the first close selective relationship of a child's life, most commonly with the mother. The relationship acts to reduce anxiety in strange settings and forms a base from which children develop further relationships and explore their environment. Seriously disturbed attachment is hypothesized to lead to personality disorders, depression, or anxiety disorders in later life. **2.** (in the National Health Service) working arrangements by which workers employed by

public bodies (such as *\*district nurses* and social workers) are engaged in association with specific general practitioners, caring for their registered patients rather than working solely on a geographical or district basis. **3. (clinical attachment)** (in the NHS) a person shadowing a clinical professional, often in order to gain experience in that professional's field or in the UK in general.

**attachment disorder** a psychiatric disorder in infants and young children resulting from *\*institutionalization*, poor parenting, emotional neglect, or *\*child abuse*. Affected children may be withdrawn or aggressive, and fearful or attention-seeking and indiscriminately friendly. Treatment requires the provision of stable caring adults as parents over a long period of time.

**attendance allowance** *see* **DISABILITY LIVING ALLOWANCE**.

**attention-deficit/hyperactivity disorder (ADHD, attention deficit disorder, hyperkinetic disorder)** a developmental disorder characterized by grossly excessive levels of activity and a marked impairment of the ability to attend and concentrate. The behaviour may be predominantly hyperactive-impulsive, predominantly inattentive, or combined. It is hypothesized that the majority of patients have a higher than normal number of dopamine transporter complexes, reducing the amount of freely available dopamine in the synaptic cleft. This leads to cognitive problems, including an inability to keep attention, to focus attention, and to perform organizational planning. Learning is impaired as a result, and behaviour can be disruptive and may be defiant or aggressive. ADHD is highly genetic. It is estimated to affect up to 5% of children; the prevalence is lower in adults because the number of dopamine transporter complexes in the brain naturally declines over time. Untreated, many children later develop *\*conduct disorder* or *\*personality disorders*. Treatment usually involves drugs (such as amphetamines and *\*methylphenidate*) and behaviour therapy; the family needs advice and practical help.

**attenuation** *n.* reduction of the disease-producing ability (virulence) of a bacterium or virus by chemical treatment, heating, drying, by growing under adverse conditions, or by passing through another organism. Treated (**attenuated**) bacteria or viruses are used for many *\*immunizations*.

**atticotomy** *n.* a surgical operation to remove **\*cholesteatoma** from the ear. It is a form of limited **\*mastoidectomy**.

**attrition** *n.* (in dentistry) non-carious tooth-surface loss caused by tooth-to-tooth contact. A small amount of attrition occurs with age but accelerated wear may occur in **\*bruxism** and with certain diets.

**atypical antipsychotics** *see* **ANTIPSYCHOTIC**.

**atypical facial pain** *see* **PERSISTENT IDIOPATHIC FACIAL PAIN**.

**atypical mole syndrome (dysplastic naevus syndrome)** a condition in which patients have numerous moles, some of which are relatively large and irregular in shape or pigmentation. There may be a family history of this syndrome or of malignant **\*melanoma**.

**atypical pneumonia** any one of a group of community-acquired **\*pneumonias** that do not respond to penicillin but do respond to such antibiotics as tetracycline and erythromycin. They include infection with *Mycoplasma pneumoniae*, *Chlamydia psittaci* (*see* **PSITTACOSIS**), and *Coxiella burnetii* (*see* **Q FEVER**).

**audi- (audio-)** *combining form denoting* hearing or sound.

**audiogram** *n.* the graphic record of a test of hearing carried out on an audiometer. The term is also commonly used to refer to types of hearing test. A **pure tone audiogram (PTA)** is a test that uses tones of a single frequency, played to the test subject through headphones. A **free field audiogram** uses sounds presented to the patient through loudspeakers. A **speech audiogram** uses lists of words played to the patient through headphones.

**audiology** *n.* the study of disorders of hearing.

**audiometer** *n.* an apparatus for testing hearing at different sound frequencies, so helping in the diagnosis of deafness. — **audiometry** *n.*

**audit** *n.* *see* **CLINICAL AUDIT**.

**AUDIT (Alcohol Use Disorders Identification Tool)** an international tool used as an outcome or screening measure for alcohol problems. Developed by the World Health Organization, it consists of 10 questions that review

consumption, drinking behaviours, and alcohol-related issues using an interview or a self-report approach. A score of 8 or above suggests hazardous or harmful alcohol consumption; 20 or above suggests alcohol dependence.

**auditory** *adj.* relating to the ear or to the sense of hearing.

**auditory brainstem implant** a device similar to a **\*cochlear implant** except that the electrode stimulates the auditory parts of the **\*brainstem** rather than the cochlea. It is used to restore hearing of profoundly deaf people who have had damage to both auditory nerves and are hence unsuitable for cochlear implantation. It consists of an electrode that is permanently implanted on the surface of the brainstem. An external device with a microphone and an electronic processing unit pass information to the electrode using radio-frequency waves. The implant is powered by batteries in the external part of the device. It is most commonly used in patients with **\*neurofibromatosis** type II who have had bilateral **\*vestibular schwannomas**.

**auditory brainstem response audiometry (ABR audiometry, brainstem evoked response audiometry, BSER)** an objective test of hearing that measures the electrical activity in the auditory nerve and **\*brainstem** following sound stimulation using repeated clicks or brief tones.

**auditory canal (auditory meatus)** the canal leading from the pinna to the eardrum.

**auditory dyssynchrony** *see* **AUDITORY NEUROPATHY SPECTRUM DISORDER**.

**auditory nerve** *see* **COCHLEAR NERVE**.

**auditory neuropathy spectrum disorder (auditory neuropathy, auditory dyssynchrony)** a form of hearing loss characterized by normal cochlear function as measured by **\*otoacoustic emissions** or detection of **\*cochlear microphonics** but abnormal or absent **\*middle ear reflexes** and abnormal **\*auditory brainstem responses**.

**auditory processing disorder (APD, central auditory processing disorder, CAPD)** a series of conditions characterized by difficulty in hearing and processing auditory information, especially in poor acoustic environments,

despite normal or near-normal ear function. It may be due to genetic factors, maturational delay in the central nervous system, or focal abnormalities of the central nervous system (such as tumours). Treatments include *\*hearing therapy*, *\*auditory skills training*, educational support, use of *\*assistive listening devices*, and training with computerized therapy tools.

**auditory skills training** a method of teaching people to use their hearing to its best potential, undertaken in the treatment of *\*auditory processing disorder*.

**auditory steady state response (ASSR)** an objective test of hearing that measures the electrical activity in the auditory nerve and *\*brainstem* following sound stimulation using a modulated continuous tone.

**auditory verbal therapy (AVT)** a technique for teaching deaf children to communicate that focuses on speech and residual hearing rather than sign language.

**Auerbach's plexus (myenteric plexus)** a collection of nerve fibres – fine branches of the *\*vagus nerve* – within the walls of the intestine. It supplies the muscle layers and controls the movements of *\*peristalsis*. [L. Auerbach (1828–97), German anatomist]

**AUR** acute urinary retention (*see* *RETENTION*).

**aura** *n.* the forewarning of an epileptic or migrainous attack. An **epileptic aura** (sometimes known as the **preictal phase**, because it precedes the main *\*ictus* or seizure) may take many forms, such as an odd smell or taste. The **migrainous aura** may affect the patient's eyesight with visual phenomena, such as fortification spectra (zigzag lines) or scotomas (black holes in the visual field), but it may also result in pins and needles, weakness of the limbs, or *\*aphasia*.

**aural** *adj.* relating to the ear.

**auricle** *n.* **1.** a small pouch in the wall of each *\*atrium* of the heart: the term is also used incorrectly as a synonym for *\*atrium*. **2.** *see* *PINNA*.

**auriscope (auroscope, otoscope)** *n.* an apparatus for examining the ear canal (external meatus) and eardrum. It consists of a funnel (speculum), a light, and lenses (*see* illustration).

**An auriscope.**

**auscultation** *n.* the process of listening, usually with the aid of a **\*stethoscope**, to sounds produced by movement of gas or liquid within the body. Auscultation is an aid to diagnosis of abnormalities of the heart, lungs, intestines, and other organs according to the characteristic changes in sound pattern caused by different disease processes. —**auscultatory** *adj.*

**auscultatory gap** a silent period in the knocking sounds heard with a stethoscope over an artery, between the systolic and diastolic blood pressures, when the blood pressure is measured with a **\*sphygmomanometer**.

**Austin Flint murmur** a heart **\*murmur** that is loudest in diastole and associated with a third heart sound. It is a sign of **\*aortic regurgitation**, which allows retrograde filling and rapid rise in left intraventricular pressure. This prevents the mitral valve from opening fully, giving rise to the murmur, which is best heard in the mitral area (apex) rather than the aortic area (where the problem lies). [Austin Flint (1812–86), US physician]

**Australia antigen** another name for the **\*hepatitis B** antigen, which was first discovered in the blood of an Australian aborigine. This disease is caused by a virus of which the Australia antigen forms part.

**aut- (auto-)** *combining form denoting self.* Example: **autokinesis** (voluntary movement).

**autism** *n.* a psychiatric disorder of childhood, with an onset before the age of 2½ years. It is marked by severe difficulties in communicating and forming relationships with other people, in developing language, and in using abstract concepts; repetitive and limited patterns of behaviour (see **STEREOTYPY**); and obsessive resistance to tiny changes in familiar surroundings. Autistic children find it hard to understand how other people feel, and so tend to remain isolated even into adult life. About 50% have learning disabilities, but some may be gifted in specific areas. The cause is unknown, but genetic factors and brain damage may be important. The condition usually progresses into adulthood, and independent living is uncommon. Treatment is not specific, but lengthy specialized education is usually necessary. Behaviour problems and anxiety can be controlled with behaviour therapy and drugs (such as **\*antipsychotics**). Autism and similar developmental disorders, including **\*Asperger's syndrome** and **\*Rett's syndrome**, are known as **autistic spectrum disorders**. —**autistic** *adj.*

<https://www.autism.org.uk/>

- Website of the National Autistic Society: includes resources for health and care professionals and links to the UK's Autism Services Directory

**autoagglutination** *n.* the clumping together of the body's own red blood cells by antibodies produced against them, which occurs in acquired haemolytic anaemia (an **\*autoimmune disease**).

**autoantibody** *n.* an antibody formed against one of the body's own components in an **\*autoimmune disease**.

**autochthonous** *adj.* **1.** remaining at the site of formation. A blood clot that has not been carried in the bloodstream from its point of origin is described as autochthonous. **2.** originating in an organ without external stimulus, like the beating of the heart.

**autoclave** **1.** *n.* a piece of equipment for sterilizing surgical instruments, dressings, etc. It consists of a chamber, similar to a domestic pressure cooker, in which the articles are placed and treated with steam at high pressure. **2.** *vb.* to sterilize in an autoclave.

**autocrine** *adj.* describing the production by a cell of substances, such as hormones or **\*growth factors**, that can influence the growth of the cell that produces them.

**autofluorescence** *n.* **\*fluorescence** of structures in the absence of fluorescein dye. Structures such as optic disc **\*drusen** fluoresce when stimulated by cobalt blue light.

**autogenous** *adj.* originating within the body of the patient. For example, an autogenous vein graft, to bypass a blocked artery, is made from material derived from the body of the patient receiving the graft.

**autograft** *n.* a tissue graft taken from one part of the body and transferred to another part of the same individual. The repair of burns is often done by grafting on strips of skin taken from elsewhere on the body, usually the upper arm or thigh. Unlike **\*allografts**, autografts are not rejected by the body's immunity defences. *See also* **SKIN GRAFT**; **TRANSPLANTATION**.

**autoimmune disease** one of a number of otherwise unrelated disorders caused by inflammation and destruction of tissues by the body's own **\*immune response**. These disorders include acquired haemolytic anaemia, pernicious anaemia, rheumatic fever, rheumatoid arthritis, glomerulonephritis, systemic lupus erythematosus, myasthenia gravis, Sjögren's syndrome, and several forms of thyroid dysfunction, including Hashimoto's disease. It is not known why the body should lose the ability to distinguish between substances that are 'self' and those that are 'non-self'.

**autoimmunity** *n.* a disorder of the body's defence mechanisms in which an **\*immune response** is generated against components or products of its own tissues, treating them as foreign material and attacking them. *See* **AUTOIMMUNE DISEASE**; **IMMUNITY**.

**autoinoculation** *n.* the accidental transfer of inoculated material from one site in the body to another. Following vaccination against smallpox, for example, satellite lesions may occur around the site of inoculation. Sometimes the conjunctiva is affected.

**autointoxication** *n.* poisoning by a toxin formed within the body.

**autologous** *adj.* denoting a graft or transplant that is derived from the recipient of the graft. In dentistry, autologous pulp stem cells are used in the generation of new tissue to replace damaged or defective tissue and autologous bone grafts may be used when placing dental implants.

**autolysis** *n.* the destruction of tissues or cells brought about by the actions of their own enzymes. *See* [LYSOSOME](#).

**automated external defibrillator (AED)** a type of external [\\*defibrillator](#) that can analyse the heart rhythm it detects and advise via voice prompts on therapy to be given according to the latest guidelines. In cases of ventricular fibrillation, some defibrillators will make decisions on delivering electric shocks and do so after issuing appropriate warnings to the attending health-care professionals.

**automated lamellar keratectomy (ALK)** excision of the outer layers of the cornea using an automated [\\*keratome](#). It is usually used as part of a surgical procedure, to alter the shape of the cornea to correct errors of refraction.

**automated perimeter** *see* [PERIMETER](#).

**automatism** *n.* behaviour that may be associated with [\\*epilepsy](#), in which the patient performs well-organized movements or tasks while unaware of doing so. The movements may be simple and repetitive, such as hand clapping and lip smacking, or they may be so complex as to mimic a person's normal conscious activities.

**autonomic nervous system** the part of the [\\*peripheral nervous system](#) responsible for the control of involuntary muscles (e.g. the heart, bladder, bowels) and hence those bodily functions that are not consciously directed, including regular beating of the heart, intestinal movements, sweating, salivation, etc. The autonomic system is subdivided into **sympathetic** and **parasympathetic nervous systems**. Sympathetic nerves lead from the middle section of the spinal cord and parasympathetic nerves from the brain and lower spinal cord. The heart, smooth muscles, and most glands receive fibres of both kinds: the interplay of sympathetic and parasympathetic reflex activity (the actions are often antagonistic) governs their working. For example, the parasympathetic system is responsible for slowing the heart rate and constricting the pupillary muscles; the sympathetic system increases the

heart rate and dilates the pupil. Sympathetic nerve endings liberate *\*noradrenaline* as a neurotransmitter; parasympathetic nerve endings release *\*acetylcholine*.

**autonomy** *n.* literally ‘self-rule’, the capacity for reasoned self-determination in thought and action. Respect for the autonomy of all persons with capacity, particularly patients, is one of the *\*four principles* of medical ethics. In practice, a patient’s capacity to exercise autonomy may be constrained by various circumstances, but in law it is formally safeguarded by the need for valid *\*consent* to treatment or research. Autonomy is not unlimited in its scope, e.g. as a general principle, patients can request but not demand treatment. Professional autonomy involves *\*reflective practice* and attempting to follow one’s own principles consistently and confidently. — **autonomous** *adj.*

**autophony** *n.* a sensation of being able to hear one’s own voice or breathing unusually loudly. It occurs most commonly in conductive *\*deafness*, more rarely in *\*patulous* Eustachian tube and *\*superior canal dehiscence syndrome*.

**autoploidy** *n.* the normal condition in cells or individuals, in which each cell has a chromosome set consisting of *\*homologous* pairs, enabling cells to divide normally. — **autoploid** *adj., n.*

**autopsy (necropsy, post mortem)** *n.* a review of the clinical history of a deceased person followed by external examination of the body, evisceration and dissection of the internal organs, and ancillary investigations (such as histopathology, microbiology, or toxicology) to determine the cause of death. Autopsies may be performed on the instruction of a medicolegal authority or at the request of clinicians (with consent of the family). In addition to determining the cause of death, autopsies have a role in research, audit, clinical governance, and medical education.

**autopulse** *n.* a mechanical device designed to compress the chest (and thereby the heart) rhythmically, with the aim of maintaining the circulation during *\*cardiac arrest*. It is more efficient than manual chest compression and has the advantage of allowing *\*percutaneous* coronary intervention to be performed without interruption of chest compression.

**autoradiography (radioautography)** *n.* a technique for examining the distribution of a radioactive **\*tracer** in the tissues of an experimental animal. The tracer is injected into the animal, which is killed after a certain period. Thin sections of its organs are placed in close contact with a radiation-sensitive material, such as a photographic emulsion, and observed under a microscope. Blackening of the film indicates a high concentration of radioactive material.

**autorefractor** *n.* a machine that automatically determines the spectacle prescription for the eye. *See also* **OPTOMETER**.

**autosomal dominant** *see* **DOMINANT**.

**autosomal recessive** *see* **RECESSIVE**.

**autosome** *n.* any chromosome that is not a **\*sex chromosome** and occurs in pairs in diploid cells. —**autosomal** *adj.*

**autotransfusion** *n.* reintroduction into a patient of his or her own blood. This may be blood previously drawn and stored in the blood bank or blood that has been lost from the patient's circulation during surgical operation. The blood is collected by suction during the operation, filtered to remove bubbles and small blood clots, and returned into one of the patient's veins through a drip. *See also* **CELL SAVER**.

**autotrophic (lithotrophic)** *adj.* describing organisms (known as **autotrophs**) that synthesize their organic materials from carbon dioxide and nitrates or ammonium compounds, using an external source of energy. **Photoautotrophic** organisms, including green plants and some bacteria, derive their energy from sunlight; **chemoautotrophic** (or **chemosynthetic**) organisms obtain energy from inorganic chemical reactions. All autotrophic bacteria are nonparasitic. *Compare* **HETEROTROPHIC**.

**aux- (auxo-)** *combining form denoting* increase; growth. Example: **auxocardia** (enlargement of the heart).

**auxiliary** *n.* a person who volunteers to assist and carry out complementary tasks at hospitals or other medical facilities.

**auxotroph** *n.* a strain of a microorganism, derived by mutation, that requires one or more specific factors for growth not needed by the parent organism.

**avascular** *adj.* lacking blood vessels or having a poor blood supply. The term is usually used with reference to cartilage.

**avascular necrosis** *see* **OSTEONECROSIS**.

**Avastin** *n.* *see* **BEVACIZUMAB**.

**aversion therapy** a form of **\*behaviour therapy** that is used to reduce the occurrence of undesirable behaviour, such as sexual deviations or drug addiction. **\*Conditioning** is used, with repeated pairing of some unpleasant stimulus with a stimulus related to the undesirable behaviour. An example is the use of **\*disulfiram** in the treatment of alcoholism. Aversion therapy is little used nowadays. *See also* **SENSITIZATION**.

**avian influenza** a disease of poultry and other birds caused by strains of **\*influenza** A virus. The severity of the disease depends on the strain of virus involved: H5N1 is particularly deadly (causing fowl plague (or pest), with a mortality approaching 100%) and very contagious, being spread between domestic flocks by wild birds. This virus is not easily transmissible to humans, requiring close contact with infected birds or their faeces. The first human cases of H5N1 infection ('bird flu') were reported in 1997 and restricted to Hong Kong: 18 people were infected, six of whom died. Since then half of the people infected with H5N1 in Asia, Europe, the Near East, and Africa have died. Most cases of avian influenza in humans have resulted from contact with infected poultry; human-to-human transmission has been extremely rare. However, if H5N1 should develop this ability, a serious pandemic could occur. *See also* **SWINE INFLUENZA**.

**AVM** arteriovenous malformation (*see* **ANGIOMA**).

**AVNRT** *see* **ATRIOVENTRICULAR NODAL RE-ENTRY TACHYCARDIA**.

**avoidant** *adj.* describing a **\*personality** disorder characterized by self-consciousness, hypersensitivity to rejection and criticism from others, avoidance of normal situations because of their potential risk, high levels of tension and anxiety, and consequently a restricted life.

**AVPU** a system for assessing the depth of unconsciousness: A = alert; V = voice responses present; P = pain responses present; U = unresponsive. It is useful for judging the severity of head injury and the need for specialized neurosurgical assistance before proceeding to formal evaluation by the **\*Glasgow Coma Scale**.

**AVRT** *see* **ATRIOVENTRICULAR RECIPROCATING TACHYCARDIA**.

**AVT** *see* **AUDITORY VERBAL THERAPY**.

**avulsion** *n.* **1.** the tearing or forcible separation of part of a structure. For example, a tendon may be torn from the bone to which it attaches or the skin of the scalp may be torn from the underlying tissue and bone. **2.** (in dentistry) the complete displacement of a tooth from its socket owing to trauma. The ideal treatment for an avulsed permanent tooth would be **\*replantation** (immediately if possible).

**axial** *adj.* at right angles to the long **\*axis** of the body, i.e. denoting a horizontal plane through a standing patient at 90° to the **\*coronal** and **\*sagittal** planes. This is the usual plane for the primary images obtained at **\*computerized tomography**. *See also* **MULTIPLANAR RECONSTRUCTION**.

**axilla** *n.* (*pl.* **axillae**) the armpit. —**axillary** *adj.*

**axis** *n.* **1.** a real or imaginary line through the centre of the body or one of its parts or a line about which the body or a part rotates. **2.** the second **\*cervical** vertebra, which articulates with the atlas vertebra above and allows rotational movement of the head.

**axolemma** *n.* the fine cell membrane, visible only under the electron microscope, that encloses the protoplasm of an **\*axon**.

**axon** *n.* a nerve fibre: a single process extending from the cell body of a **\*neuron** and carrying nerve impulses away from it. An axon may be over a metre in length in certain neurons. In large nerves the axon has a sheath (**neurilemma**) made of **\*myelin**; this is interrupted at intervals by gaps called **nodes of Ranvier**, at which branches of the axon leave. An axon ends by dividing into several branches called **telodendria**, which make contact with other nerves or with muscle or gland membranes.

**axonotmesis** *n.* rupture of nerve fibres (axons) within an intact nerve sheath. This may result from prolonged pressure or crushing and it is followed by degeneration of the nerve beyond the point of rupture. The prognosis for **\*nerve regeneration** is good. *Compare* **NEURAPRAXIA**; **NEUROTMESSIS**.

**axoplasm** *n.* the semifluid material of which the **\*axon** of a nerve cell is composed. It flows slowly outwards from the cell body.

**azathioprine** *n.* an **\*immunosuppressant** drug, used mainly to aid the survival of organ or tissue transplants. It may also be used in the treatment of severe Crohn's disease, rheumatoid arthritis (*see* **DISEASE-MODIFYING ANTIRHEUMATIC DRUG**), myasthenia gravis, and severe eczema. Azathioprine may damage bone marrow, causing blood disorders; other possible side-effects include nausea and vomiting, malaise, muscle pain, and skin rashes.

**azelaic acid** an antibacterial drug applied externally as a cream or gel in the treatment of acne and rosacea. Possible side-effects include local irritation and light sensitivity.

**azelastine** *n.* an **\*antihistamine** drug administered for the treatment of hay fever and to treat allergic conjunctivitis. Possible side-effects include nasal irritation and disturbances of taste sensation.

**azithromycin** *n.* an antibiotic used to treat respiratory, skin, soft-tissue, and other infections, including genital and eye infections caused by *Chlamydia trachomatis*. Possible side-effects include allergic reactions, nausea, and vomiting.

**azo- (azoto-)** *combining form denoting* a nitrogenous compound, such as urea. Example: **azothermia** (raised temperature due to nitrogenous substances in the blood).

**azoospermia (aspermia)** *n.* the complete absence of sperm from the seminal fluid. This is due either to profound impairment of sperm formation (**\*spermatogenesis**) due to damage to the testes (e.g. caused by **\*cryptorchidism**, mumps **\*orchitis**, or radio- or chemotherapy) or – more commonly – to obstruction of the genital tract (e.g. resulting from vasectomy, gonorrhoea, or *Chlamydia* infection). A biopsy of the testis is necessary in order to differentiate these two causes of azoospermia; if a blockage is

present it may be possible to relieve it surgically (*see* EPIDIDYMOVASOSTOMY).

**azotaemia** *n.* a former name for *\*uraemia*.

**azoturia** *n.* the presence in the urine of an abnormally high concentration of nitrogen-containing compounds, especially urea.

**aztreonam** *n.* an antibiotic administered by injection or inhalation used to treat infections of the lungs, bones, skin, and soft tissues caused by Gram-negative organisms (*see* GRAM'S STAIN), including lung infections in patients with cystic fibrosis. Possible side-effects include skin rashes, diarrhoea, and vomiting.

**azygos vein** an unpaired vein that arises from the inferior vena cava and drains into the superior vena cava, returning blood from the thorax and abdominal cavities.

## B

**Babinski reflex** *see* **PLANTAR REFLEX**. [J. F. F. Babinski (1857–1932), French neurologist]

**baby blues (postpartum blues)** a colloquial name for the brief episodes of low mood, tearfulness, poor sleep, and irritability that affect up to half of all women during the first week after delivery. Reassurance and support are the mainstay of management. *Compare* **POSTNATAL DEPRESSION**; **PUERPERAL PSYCHOSIS**.

**bacillaemia** *n.* the presence of bacilli in the blood, resulting from infection.

**bacille Calmette–Guérin** *see* **BCG**. [A. L. C. Calmette (1863–1933) and C. Guérin (1872–1961), French bacteriologists]

**bacilluria** *n.* the presence of bacilli in the urine, resulting from a bladder or kidney infection. *See* **CYSTITIS**.

**bacillus** *n.* (*pl.* **bacilli**) any rod-shaped bacterium. *See also* **BACILLUS**; **LACTOBACILLUS**; **STREPTOBACILLUS**.

**Bacillus** *n.* a large genus of Gram-positive spore-bearing rodlike bacteria. They are widely distributed in soil and air (usually as spores). Most feed on dead organic material and are responsible for food spoilage. The species *B. anthracis*, which is nonmotile, causes **\*anthrax**, a disease of farm animals transmissible to humans. *B. polymyxa*, commonly found in soil, is the source of the polymyxin group of antibiotics. *B. subtilis* may cause conjunctivitis in humans; it is also a source of the antibiotic **\*bacitracin zinc**.

**bacitracin zinc** an antibiotic effective against a number of microorganisms. Combined with polymyxin B, it is applied externally to treat infections of the

skin and eyes.

**backbone (spinal column, spine, vertebral column)** *n.* a flexible bony column extending from the base of the skull to the small of the back. It encloses and protects the spinal cord, articulates with the skull (at the atlas), ribs (at the thoracic vertebrae), and hip girdle (at the sacrum), and provides attachment for the muscles of the back. It is made up of individual bones (*see* **VERTEBRA**) connected by discs of fibrocartilage (*see* **INTERVERTEBRAL DISC**) and bound together by ligaments. The backbone of a newborn baby contains 33 vertebrae: seven cervical (neck), 12 thoracic (chest), five lumbar (lower back), five sacral (hip), and four coccygeal. In the adult the sacral and coccygeal vertebrae become fused into two single bones (sacrum and coccyx, respectively); the adult vertebral column therefore contains 26 bones (*see* illustration). Anatomical name: **rachis**.

**The backbone.** Seen from the back (A) and left side (B).

**back slaps** a manoeuvre for the treatment of a choking patient. Firm slaps are given to the patient's back in an attempt to dislodge the obstructing article from the upper airway.

**baclofen** *n.* a skeletal **\*muscle relaxant** drug administered to relieve spasm resulting from injury or disease of the brain or spinal cord, including cerebral palsy and multiple sclerosis. Side-effects include dizziness, drowsiness, and nausea.

**bacteraemia** *n.* the presence of bacteria in the blood: a sign of infection.

**bacteri-** (**bacterio-**) *combining form denoting* bacteria. Example: **bacteriolysis** (dissolution of).

**bacteria** *pl. n.* (*sing.* **bacterium**) a group of microorganisms all of which lack a distinct nuclear membrane (and hence are considered more primitive than animal and plant cells) and most of which have a cell wall of unique composition (many antibiotics act by destroying the bacterial cell wall). Most bacteria are unicellular; the cells may be spherical (**\*coccus**), rod-shaped (**\*bacillus**), spiral (**\*Spirillum**), comma-shaped (**\*Vibrio**), or corkscrew-shaped (**\*spirochaete**). Generally, they range in size between 0.5 and 5  $\mu\text{m}$ . Motile species bear one or more fine hairs (flagella) arising from their surface. Many possess an outer slimy **\*capsule**, and some have the ability to produce an encysted or resting form (**\*endospore**). Bacteria reproduce asexually by simple division of cells; incomplete separation of daughter cells leads to the formation of **\*colonies** consisting of different numbers and arrangements of cells. Some colonies are filamentous in shape, resembling those of fungi. Transfer of DNA from one bacterium to another takes place in the process of **\*conjugation**.

Bacteria are very widely distributed. Some live in soil, water, or air; others are parasites of humans, animals, and plants. Many parasitic bacteria do not harm their hosts; some cause diseases by producing poisons (*see* **ENDOTOXIN**; **EXOTOXIN**).

**bacterial vaginosis** a condition caused by overgrowth of certain species of the bacteria that are normally present in the vagina (e.g. *Bacteroides*, **\*Gardnerella vaginalis**). One of the most common vaginal infections, it is marked by a greyish watery vaginal discharge with a characteristic fishy odour. Treatment is with clindamycin or metronidazole.

**bactericidal** *adj.* being capable of killing bacteria. Substances with this property include antibiotics, antiseptics, and disinfectants; they are known as **bactericides**. *Compare* BACTERIOSTATIC.

**bacteriology** *n.* the science concerned with the study of bacteria. It is a branch of \*microbiology. —**bacteriological** *adj.* —**bacteriologist** *n.*

**bacteriolysin** *n.* *see* LYSIN.

**bacteriophage (phage)** *n.* a virus that attacks bacteria. In general, a phage consists of a head, tail, and tail fibres, all composed of protein molecules, and a core of DNA. The tail and tail fibres are responsible for attachment to the bacterial surface and for injection of the DNA core into the host cell. The phage grows and replicates in the bacterial cell, which is eventually destroyed with the release of new phages. Each phage acts specifically against a particular species of bacterium. This is utilized in **phage typing**, a technique of identifying bacteria by the action of known phages on them. *See also* LYSOGENY.

**bacteriostatic** *adj.* capable of inhibiting or retarding the growth and multiplication of bacteria. Erythromycin is bacteriostatic. *Compare* BACTERICIDAL.

**bacterium** *n.* *see* BACTERIA.

**bacteriuria** *n.* the presence of bacteria in the urine ( $10^5/\text{ml}$ ) with or without symptoms of urinary tract infection (e.g. burning or frequent urination). **Asymptomatic bacteriuria** is more common in women (especially during pregnancy), the elderly, and in patients with diabetes, bladder catheters, and spinal cord injuries. Unless treated with antibiotics, patients are at higher risk of kidney infections (\*pyelonephritis).

**Bacteroides** *n.* a genus of Gram-negative, mostly nonmotile, anaerobic rodlike bacteria. They are normally present in the alimentary and urinogenital tracts of mammals and are found in the mouth, particularly in dental plaque associated with periodontal disease. Some species have now been classified into the genera *Porphyromonas* and *Prevotella*.

**bagassosis** *n.* a form of external allergic \*alveolitis caused by exposure to the dust of mouldy bagasse, the residue of sugar cane after the sugar has been

extracted, which is used in the production of hardboard and other thermal boards. Symptoms usually appear in the evening after exposure during the day and include fever, malaise, irritant cough, and respiratory distress.

**Baghdad boil** *see* **ORIENTAL SORE**.

**Bagolini lens** a lens with fine parallel lines (almost invisible striations) across its width, used in various vision tests; for example, to test suppression and abnormal retinal correspondence. [B. Bagolini (20th century), Italian ophthalmologist]

**BAHA** *see* **BONE-ANCHORED HEARING AID**.

**Baker's cyst (popliteal cyst)** a cyst behind the knee resulting from rupture or herniation of the synovial membrane from a knee joint affected by osteoarthritis or rheumatoid arthritis. [W. M. Baker (1839–96), British surgeon]

**Bakri balloon** *see* **RUSCH CATHETER**. [Y. Bakri (21st century), US obstetrician]

**BAL** *see* **BRONCHOALVEOLAR LAVAGE**.

**balanced salt solution (BSS)** a solution containing physiological concentrations of sodium chloride, potassium chloride, calcium chloride, magnesium chloride, sodium acetate, and sodium citrate. Such fluids are isotonic to eye tissue; they are used during intraocular surgery and to replace intraocular fluids.

**balanitis** *n.* inflammation of the glans penis, usually associated with tightness of the foreskin (**\*phimosis**). It is more common in childhood than in adult life. An acute attack is associated with redness and swelling of the glans. Treatment is by antibiotics, and further attacks are prevented by **\*circumcision**. In **Zoon's plasma cell balanitis** persistent shiny red patches develop on the glans; the cause is unknown. **Balanitis xerotica obliterans (BXO, lichen sclerosis et atrophicus)** is an autoimmune condition characterized by ivory-white patches on the glans associated with stenosis of the urethral meatus and urethral strictures.

**balanoposthitis** *n.* inflammation of the foreskin and the surface of the underlying glans penis. It usually occurs as a consequence of **\*phimosis** and represents a more extensive local reaction than simple **\*balanitis**. The affected areas become red and swollen, which further narrows the opening of the foreskin and makes passing urine difficult and painful. Treatment of an acute attack is by administration of antibiotics, and further attacks are prevented by **\*circumcision**.

**balantidiasis** *n.* an infestation of the large intestine with the parasitic protozoan **\*Balantidium coli**. Humans usually become infected by ingesting food or drink contaminated with cysts from the faeces of a pig. The parasite invades and destroys the intestinal wall, causing ulceration and **\*necrosis**, and the patient may experience diarrhoea and dysentery. Balantidiasis is a rare cause of dysentery, mainly affecting farm workers; it is treated with various antibiotics.

**Balantidium** *n.* a genus of one of the largest parasitic **\*protozoans** affecting humans (70 µm or more in length). The oval body is covered with threadlike cilia (for locomotion). *B. coli*, normally living in the gut of pigs as a harmless **\*commensal**, occasionally infects humans (see **BALANTIDIASIS**).

**baldness** *n.* see **ALOPECIA**.

**Balint's syndrome** a disorder, arising from bilateral occipito-parietal **\*strokes**, characterized by inability to perceive the visual field as a whole (simultanagnosia), difficulty in fixating the eyes (oculomotor apraxia), and inability to move the hand to a specific object using vision (optic ataxia). [R. Balint (1874–1929), Hungarian neurologist]

**Balkan nephropathy** a severe and progressive form of tubulointerstitial renal disease (see **TUBULOINTERSTITIUM**), first described in 1956 and endemic to certain rural areas along the tributaries of the Danube in Bosnia, Bulgaria, Croatia, Romania, and Serbia. The natural course of the disease is progression to end-stage kidney failure and frequent development of tumours in the upper urinary tract. It seems likely that an environmental factor is responsible for the disease, and evidence supports the theory that long-term consumption of food contaminated with seeds from plants of **\*Aristolochia** spp. underlies the pathogenesis.

**ball-and-cage valve** a form of mechanical prosthesis commonly used in the past for replacing damaged heart valves. Currently, most mechanical valve replacements are of the tilting-disc variety.

**ball-and-socket joint** *see* ENARTHROSIS.

**Ballantyne syndrome (maternal mirror syndrome)** a condition that occurs in cases of *\*hydrops fetalis* when the maternal condition begins to mirror the state of the fetus. The maternal signs and symptoms are similar to those of *\*pre-eclampsia*, including vomiting, hypertension, oedema, and proteinuria.

**ballism** *n.* violent repetitive involuntary movements particularly involving the proximal limbs. They occur following bilateral damage to the *\*subthalamic nuclei* of the basal ganglia, most commonly after stroke, haemorrhage, or trauma. In **hemiballismus**, only one side of the body is affected due to contralateral subthalamic dysfunction.

**balloon** *n.* an inflatable plastic cylinder of variable size that is mounted on a thin tube and used for dilating narrow areas (*\*stenosis*) in blood vessels (*see* ANGIOPLASTY), in the alimentary tract (*\*strictures*), or in the urinary tract (*see* ENDOPYELOTOMY).

**balloon Eustachian tuboplasty** a surgical procedure used to treat dysfunction of the *\*Eustachian tube*. A small balloon is inserted from the *\*nasopharynx* into the Eustachian tube in a deflated state under endoscopic control. It is then inflated to widen the Eustachian tube before being deflated and removed.

**balloon sinuplasty** a surgical procedure to open or enlarge a blocked ostium of the *\*paranasal sinuses* in patients with chronic *\*rhinosinusitis*. A small balloon is inserted into the ostium in a deflated state under endoscopic control. It is then inflated to enlarge the ostium and finally deflated and removed.

**ballottement** *n.* the technique of examining a fluid-filled part of the body to detect a floating object. During pregnancy, a sharp tap with the fingers, applied to the uterus through the abdominal wall or the vagina, causes the fetus to move away and then return to impart an answering tap to the examiner's hand as it floats back to its original position. This confirms that

swelling of the uterus is due to a fetus rather than a tumour or other abnormality.

**balneotherapy** *n.* the treatment of disease by bathing, usually in the mineral-containing waters of hot springs. The once fashionable ‘water cures’, taken at spas, certainly had a more psychological than physical effect. Today, specialized remedial treatment in baths, under the supervision of physiotherapists, is used to alleviate pain and improve blood circulation and limb mobility in arthritis and in nerve and muscle disorders.

**bamboo spine** an X-ray appearance of the spine in which there is squaring of the vertebrae and vertical *\*syndesmophytes* that span adjacent vertebrae, so that the spine resembles a stick of bamboo. This results in fusion of the spine with a very limited range of motion. It is seen in ankylosing *\*spondylitis*.

**banana and lemon signs** ultrasound features of the *\*Arnold–Chiari malformation* in fetuses with spina bifida. The **banana sign** refers to the shape of the cerebellum owing to caudal displacement; the **lemon sign** refers to the lemon-shaped head resulting from scalloping of the frontal bones. See illustration.

**Banana and lemon signs.**

**bandage** *n.* a piece of material, in the form of a pad or strip, applied to a wound or used to bind around an injured or diseased part of the body.

**bandage lens** a soft contact lens that can be useful in managing certain external eye disorders, including tiny perforations.

**band keratopathy** the deposition of calcium in the superficial layers of the cornea, usually as a horizontal band starting peripherally and moving centrally. It is associated with chronic eye disease, e.g. chronic *\*uveitis*, particularly juvenile chronic uveitis. It is treated by application of EDTA (see *EDETATE*) or with an *\*excimer laser*.

**band ligation (banding)** *see* *OESOPHAGEAL VARICES*. *See also* *GASTRIC BANDING*.

**Bandl's ring** *see* *RETRACTION RING*. [L. Bandl (1842–92), German obstetrician]

**Banti's syndrome** a disorder in which enlargement and overactivity of the spleen occurs as a result of increased pressure within the splenic vein (see *HYPERSPLENISM*; *SPLENOMEGALY*). It arises primarily in children and occurs with *\*cirrhosis* of the liver. [G. Banti (1852–1925), Italian pathologist]

**barbiturate** *n.* any of a group of drugs, derived from barbituric acid, that depress activity of the central nervous system and were formerly widely used as sedatives and hypnotics. They are classified into three groups according to their duration of action – short, intermediate, and long. Because they produce *\*tolerance* and psychological and physical *\*dependence*, have serious toxic side-effects (see *BARBITURISM*), and can be fatal following large overdosage, barbiturates have been largely replaced in clinical use by safer drugs. The main exception is the very short-acting drug *\*thiopental*, which is used to induce anaesthesia. *See also* *AMOBARBITAL*; *BUTOBARBITAL*; *PHENOBARBITAL*.

**barbiturism** *n.* addiction to drugs of the barbiturate group. Signs of intoxication include confusion, slurring of speech, yawning, sleepiness, loss of memory, loss of balance, and reduction in muscular reflexes. Withdrawal of the drugs must be undertaken slowly, over 1–3 weeks, to avoid the withdrawal symptoms of tremors and convulsions, which can prove fatal.

**barefoot doctor** *see* *MEDICAL ASSISTANT*.

**bariatric surgery** surgery performed for the purpose of weight loss in obese patients. Most procedures are restrictive, being designed to promote feelings of fullness and satiety after meals (see [GASTRIC BANDING](#); [STOMACH STAPLING](#)). *See also* [GASTRIC BYPASS SURGERY](#); [JAW WIRING](#).

**baritosis** *n.* a lung disease – a form of [\\*pneumoconiosis](#) – caused by inhaling barium dust. It gives dramatic shadows on chest X-rays but no respiratory disability.

**barium enema** a radiological technique used to diagnose conditions of the large bowel using the combination of X-ray imaging and radiopaque contrast (barium sulphate). Prior bowel cleansing is usually required with a colonic cleansing preparation. A large-bore tube with a balloon is inserted into the rectum and through this the barium is delivered to the caecum. The balloon is inflated in the rectum to prevent leakage of barium outside. In [\\*double contrast](#) studies, air is passed through the catheter to distend the colon. A series of radiographs are taken after barium has coated the colon, and the patient may be asked to change position to ensure that the whole bowel is delineated. Barium enema is used to identify colonic polyps, colorectal cancer, and diverticular disease. However, its role has been largely taken over by [\\*colonoscopy](#) which enables additional mucosal sampling and therapeutic intervention.

**barium follow-through** *see* [SMALL-BOWEL MEAL](#).

**barium sulphate** a barium salt, extremely insoluble in water, that is opaque to X-rays and is used as a [\\*contrast medium](#) in radiography of the gastrointestinal tract (see [BARIUM ENEMA](#); [BARIUM SWALLOW AND MEAL](#)).

**barium swallow and meal** a radiological technique used to assess the anatomy and function of the upper gastrointestinal tract. The patient swallows radiopaque contrast (barium sulphate), which coats the mucosal surfaces of the oesophagus, stomach, and duodenum. The descent of the barium is charted by a series of radiographs. Gas-forming agents (such as sodium bicarbonate) may be given to aid gastric distension and improve the quality of the images. This can be used to diagnose disorders of oesophageal motor function, tumours, peptic ulcers, hiatus [\\*hernias](#), and [\\*gastro-oesophageal](#)

**reflux disease**. Many indications for this examination have been replaced by the use of an endoscope.

**Barlow manoeuvre** a test for **\*congenital dislocation of the hip** that detects whether or not a hip can be readily dislocated. With the baby lying supine and the pelvis steadied with one hand, the hip being tested is gently adducted and backward pressure is applied to the head of the femur. If the hip is dislocatable, a clunk will be felt and sometimes heard (**Von Rosen's sign**). If the hip is gently abducted, it will usually relocate. [T. Barlow (1845–1945), British physician]

**BARN** bilateral **\*acute retinal necrosis**.

**baroreceptor (baroreceptor)** *n.* a collection of sensory nerve endings specialized to monitor changes in blood pressure. The main receptors lie in the **\*carotid sinuses** and the **\*aortic arch**; others are found in the walls of other large arteries and veins and some within the walls of the heart. Impulses from the receptors reach centres in the medulla; from here autonomic activity is directed so that the heart rate and resistance of the peripheral blood vessels can be adjusted appropriately.

**barotitis** *n.* disease of the ear caused by changing air pressure, as experienced during air travel.

**barotrauma** *n.* damage to the ear, **\*Eustachian tube**, or paranasal sinuses caused by changes in ambient pressure, as experienced during air flight or deep-sea diving.

**Barr body** *see* **SEX CHROMATIN**. [M. L. Barr (1908–95), Canadian anatomist]

**Barrett's oesophagus (columnar-lined oesophagus)** a condition in which the squamous **\*epithelium** lining the oesophagus is replaced by columnar epithelium of the type normally lining the intestine ('intestinal metaplasia'). Barrett's oesophagus is caused by chronic inflammation and damage resulting from **\*gastro-oesophageal reflux** or (less frequently) corrosive **\*oesophagitis**. The appearance of Barrett's epithelium seen at endoscopy must be confirmed by biopsy. Patients with confirmed Barrett's oesophagus are at a higher risk of developing oesophageal adenocarcinoma and may be kept under

surveillance with regular endoscopies. [N. R. Barrett (1903–79), British thoracic surgeon]

**barrier cream** a preparation used to protect the skin against water-soluble irritants (e.g. detergents, breakdown products of urine). Usually applied in the form of a cream or ointment and often containing a silicone (such as *\*dimeticone*), barrier creams are useful in the alleviation of various skin disorders, including napkin rash and pressure sores.

**Barron's banding apparatus** an apparatus for treating haemorrhoids in which a tight elastic band is applied across their base to cause ischaemic necrosis leading to sloughing off within a few days.

**bartholinitis** *n.* inflammation of *\*Bartholin's glands*. In **chronic bartholinitis** cysts may form in the glands as a result of blockage of their ducts. In **acute bartholinitis** abscess formation may occur (**Bartholin's abscess**).

**Bartholin's glands (greater vestibular glands)** a pair of glands that open at the junction of the vagina and the external genitalia (vulva). Their secretions lubricate the vulva and so assist penetration by the penis during coitus. The **lesser vestibular glands**, around the vaginal opening, perform the same function. [C. Bartholin (1655–1738), Danish anatomist]

**Bartonella (Haemobartonella)** *n.* a genus of Gram-negative bacteria that are facultative intracellular parasites. They occur in the red blood cells and cells of the lymphatic system, spleen, liver, and kidneys and cause several infections in humans (*see* **BARTONELLOSIS**).

**bartonellosis** *n.* an infectious disease, largely confined to high river valleys in Peru, Ecuador, and Colombia, caused by the bacterium *\*Bartonella bacilliformis*. The parasite, present in red blood cells and cells of the lymphatic system, is transmitted to humans by sandflies. There are two clinical types of the disease: **Oroya fever (Carrion's disease)**, whose symptoms include fever, anaemia, and enlargement of the liver, spleen, and lymph nodes; and **verruca peruana**, characterized by wartlike eruptions on the skin that can bleed easily and ulcerate. Oroya fever accounts for nearly all fatalities. Bartonellosis can be treated successfully with penicillin and other antibiotics and blood transfusions may be given to relieve the anaemia.

Other species of *Bartonella* cause *\*cat-scratch disease* and *\*trench fever*.

**Bartter syndrome** an inherited condition of the kidney, which causes abnormalities in the excretion and reabsorption of salts from the blood. This results in lowered levels of potassium and chloride and an increased level of calcium. The baby fails to grow properly and becomes progressively weaker and dehydrated. Treatment consists of correcting the salt imbalance with appropriate supplements. [F. C. Bartter (1914–83), US physician]

**basal cell carcinoma (BCC)** the commonest form of skin cancer. Although classified as a malignant tumour, it grows very slowly and hardly ever metastasizes. BCC usually occurs on the central area of the face, especially in fair-skinned people; the prevalence increases greatly with episodes of sunburn. The initial sign is a spot or lump that fails to heal, which slowly enlarges. Treatment depends on subtype and is usually straightforward, e.g. topical chemotherapy agents (such as 5-fluorouracil), **\*curettage** and cautery, surgical excision, **\*cryotherapy**, or **\*radiotherapy**. High-risk BCCs around the eyes or nose may be treated with **\*Mohs' micrographic surgery** to ensure low rates of recurrence and maximal tissue conservation. Only if neglected for decades does a BCC eventually become a so-called **rodent ulcer** and destroy the surrounding tissue. However, the term 'rodent ulcer' is still sometimes used to mean any basal cell carcinoma.

**basal ganglia** several large masses of grey matter embedded deep within the white matter of the **\*cerebrum** (see illustration). They include the **caudate** and **lenticular nuclei** (together known as the **corpus striatum**) and the **amygdaloid nucleus**. The lenticular nucleus consists of the **putamen** and **globus pallidus**. The basal ganglia have complex neural connections with both the cerebral cortex and thalamus: they are involved with the regulation of voluntary movements at a subconscious level. Diseases of the basal ganglia cause a range of disorders predominantly affecting movement, the commonest being **\*parkinsonism**.

**The basal ganglia.** Showing their position in relation to neighbouring parts (seen from the front).

**basal metabolism** the minimum amount of energy expended by the body to maintain vital processes, e.g. respiration, circulation, and digestion. It is expressed in terms of heat production per unit of body surface area per day (**basal metabolic rate – BMR**), and for an average man the BMR is 1.7 Calories (7.115 kilojoules) per day. BMR may be determined by the direct method, in which the subject is placed in a respiratory chamber and the amount of heat evolved is measured, or (more normally) by the indirect method, based on the *\*respiratory quotient*. Measurements are best taken during a period of least activity, i.e. during sleep and 12–18 hours after a meal, under controlled temperature conditions. Various factors, such as age, sex, and particularly thyroid activity, influence the value of the BMR.

**basement membrane** the thin delicate membrane that lies at the base of an *\*epithelium*. It is composed of mucopolysaccharide and fibres of protein.

**base pairing** the linking of the two strands of a DNA molecule by means of hydrogen bonds between the bases of the nucleotides. Adenine always pairs with thymine and cytosine with guanine. See *DNA*.

**basic life support** the provision of treatment designed to maintain adequate circulation and ventilation to a patient in *\*cardiac arrest*, without the use of drugs or specialist equipment. *Compare* **ADVANCED LIFE SUPPORT**.

**basilar artery** an artery in the base of the brain, formed by the union of the two vertebral arteries. It extends from the lower to the upper border of the pons Varolii and then divides to form the two posterior cerebral arteries.

**basilar membrane** a membrane in the *\*cochlea* of the ear that separates two of the three channels (scalae) that run the length of the spiral cochlea. The organ of Corti is situated on the basilar membrane, inside the scala media.

**basilic vein** a large vein in the arm, extending from the hand along the back of the forearm, then passing forward to the inner side of the arm at the elbow.

**basion** *n.* the midpoint of the anterior border of the large hole (foramen magnum) at the base of the *\*skull*.

**basophil 1.** *n.* a variety of white blood cell distinguished by a lobed nucleus and the presence in its cytoplasm of coarse granules that stain purple-black with *\*Romanowsky stains*. Basophils are capable of ingesting foreign particles and contain *\*histamine* and *\*heparin*. There are normally  $30\text{--}150 \times 10^6$  basophils per litre of blood. *See also* **POLYMORPH. 2.** (**basophilic**) *adj.* describing any cell that stains well with basic dyes. For example, certain cells in the anterior pituitary gland are basophilic.

**basophilia** *n.* **1.** a property of a microscopic structure whereby it shows an affinity for basic dyes. **2.** an increase in the number of certain white blood cells (*\*basophils*) in the blood, which may occur in a variety of blood diseases.

**basophilic** *adj.* *see* **BASOPHIL**.

**bat ears** *see* **PROTRUDING EARS**.

**bathyaesthesia** *n.* sensation experienced in the deeper parts of the body, such as the joints and muscles.

**Batten's disease** one of a group of rare hereditary disorders (known as the **neuronal ceroid lipofuscinoses**) that also includes *\*Tay-Sachs disease*. Fatty substances accumulate in the cells of the nervous system, causing progressive

dementia, epilepsy, spasticity, and visual failure. The condition starts in late infancy or childhood. There is no treatment. [F. E. Batten (1865–1918), British neurologist]

**battered baby syndrome** *see* [NONACCIDENTAL INJURY](#).

**battery** *n.* (in law) the wrongful touching of another person, which may be a criminal offence or a tort in civil law (the latter is known as **trespass against the person**). Any intentional touching of another is a potential battery unless it occurs with the *\*consent* of the person involved. Consent therefore provides a defence against a charge of battery brought in relation to medical treatment.

**Bazin's disease** a rare disease of young women in which tender nodules develop under the skin in the calves. The condition is a *\*tuberculide*; the nodules may break down and ulcerate though they may clear up spontaneously. Medical name: **erythema induratum**. [A. P. E. Bazin (1807–78), French dermatologist]

**BCC** *see* [BASAL CELL CARCINOMA](#).

**B cell** *n.* *see* [LYMPHOCYTE](#).

**BCG (bacille Calmette–Guérin)** a strain of tubercle bacillus that has lost the power to cause *\*tuberculosis* but retains its antigenic activity; it is therefore used to prepare a vaccine against the disease.

**BCI** bladder contractility index: a scale used to grade how strongly the urinary bladder can contract.

**bear tracks** (in ophthalmology) areas of hypertrophy of retinal pigment epithelium (*see* [RETINA](#)) that clinically resemble the prints of bears' paws.

**Beau's lines** transverse depressions on the nails appearing some weeks or months after a severe illness or chemotherapy. [J. H. S. Beau (1806–65), French physician]

**Becker muscular dystrophy** a *\*sex-linked* (X-linked) disorder in which affected males develop an increase in muscle size followed by weakness and wasting. It usually starts between the ages of 5 and 15, and 25 years after onset most patients are wheelchair-bound. Although most men become

severely disabled, life expectancy is close to normal. The disorder is similar to Duchenne *\*muscular dystrophy* but less severe. [P. E. Becker (20th century), German geneticist]

**Becker's naevus (Becker melanosis)** an irregularly shaped hyperpigmented patch that contains more hairs than is normal (hypertrichosis). The patch usually appears over half the upper trunk or shoulders in the mid- to late teens, expands over a period of 1–2 years, and persists for life. It is more common in males. No treatment is necessary except for cosmetic reasons. [W. Becker (1894–1964), US dermatologist]

**Beck's triad** *see* **CARDIAC TAMPONADE**. [C. S. Beck (1894–1971), US surgeon]

**beclometasone** *n.* a *\*corticosteroid* drug that is administered by mouth to treat ulcerative colitis, by nasal spray to treat hay fever, as a cream or ointment to treat severe skin infections, and by inhaler for the prevention of asthma. Possible side-effects include nasal irritation and hoarseness.

**becquerel** *n.* the *\*SI unit* of activity of a radioactive source, being the activity of a radionuclide decaying at a rate of one spontaneous nuclear transition per second. It has replaced the curie. Symbol: Bq.

**bed bug** a bloodsucking insect of the genus *Cimex*. *C. hemipterus* of the tropics and *C. lectularius* of temperate regions have reddish flattened bodies and vestigial wings. They live and lay their eggs in the crevices of walls and furniture and emerge at night to suck blood; although bed bugs are not known vectors of disease their bites leave a route for bacterial infection. Premises can be disinfested with appropriate insecticides.

**bed occupancy** the number of hospital beds occupied by patients expressed as a percentage of the total beds available in the ward, specialty, hospital, area, or region. It may be recorded in relation to a defined point in time or more usefully for a period, when the calculation is based on bed-days. It is used with other indices (such as *\*admission rate*) to assess the demands for hospital beds in relation to diseases, specialties, or populations and hence to gauge an appropriate balance between demand for health care and number of beds.

**bedsore** *n. see* **PRESSURE SORE**.

**bedwetting** *n.* *see* **ENURESIS**.

**behaviourism** *n.* an approach to psychology postulating that only observable behaviour need be studied, thus denying any importance to unconscious processes. Behaviourists are concerned with the laws regulating the occurrence of behaviour (*see* **CONDITIONING**). —**behaviourist** *n.*

**behaviour modification** the use of the methods of behaviourist psychology (*see* **BEHAVIOURISM**) – especially operant **\*conditioning** – to alter people's behaviour. Behaviour modification has wider applications than **\*behaviour therapy**, since it is also used in situations in which the client is not ill; for example, in education. *See also* **CHAINING**; **PROMPTING**.

**behaviour therapy** treatment based on the belief that certain psychological problems are the products of faulty learning. Treatment is directed at the problem or target behaviour and is designed for the particular patient, not for the particular underlying diagnosis the patient may have. *See also* **AVERSION THERAPY**; **CONDITIONING**; **DESENSITIZATION**; **EXPOSURE**; **RESPONSE PREVENTION**.

**Behçet's syndrome** an idiopathic disease of the immune system characterized by **\*aphthous ulcers** in the mouth, genital ulcers, skin lesions, and severe inflammation of the uveal tract of the eye (*see* **UVEITIS**). It may also involve the joints and nervous system and cause inflammation of the veins. The condition occurs more often in men than women. Treatment is aimed at controlling the immune system. [H. Behçet (1889–1948), Turkish dermatologist]

**bejel (endemic syphilis)** *n.* a long-lasting nonvenereal form of **\*syphilis** that occurs in the Balkans, Turkey, eastern Mediterranean countries, and the dry savannah regions of North Africa; it is particularly prevalent where standards of personal hygiene are low. The disease is spread among children and adults by direct body contact. Early skin lesions are obvious in the moist areas of the body (mouth, armpits, and groin) and later there may be considerable destruction of the tissues of the skin, nasopharynx, and long bones. Wartlike eruptions in the anal and genital regions are common. Bejel, which is rarely fatal, is treated with penicillin.

**bel** *n.* see DECIBEL.

**belladonna** *n.* the deadly nightshade plant (*Atropa belladonna*) or the mixture of alkaloids derived from it, which include **\*atropine** and **\*hyoscine**.

**bell and pad** a psychological method of treating bed-wetting in children and adults. When the subject starts to pass urine it is detected by a pad (or by sheets of metallic mesh) and this sets off a bell (or loud buzzer). The modern form of the apparatus has a small electronic sensor worn under the underclothes and produces a loud bleep. The purpose of the alarm is to waken the subject, who then empties the bladder fully. A process of conditioning leads to the subject learning to be dry. It is effective in about 80% of cases.

**belle indifference** a symptom of **\*conversion disorder** in which an apparently grave physical affliction or disability (which has no physical cause) is accepted in a smiling and calm fashion. It can also be a sign of dementia or psychosis.

**Bell's palsy** paralysis of the **\*facial nerve** causing weakness of the muscles of one side of the face and an inability to close the eye. In some patients hearing may be affected so that sounds seem abnormally loud, and a loss of taste sensation may occur. The cause of this condition is usually a viral infection, and recovery normally occurs spontaneously. [Sir C. Bell (1774–1842), Scottish physiologist]

**Bell's phenomenon** the normal outward and upward rotation of the eyes that occurs when the lids are closed, but not during blinking. [Sir C. Bell]

**belly** *n.* **1.** the **\*abdomen** or abdominal cavity. **2.** the central fleshy portion of a muscle.

**Bence-Jones protein** a protein of low molecular weight found in the urine of patients with multiple **\*myeloma** and rarely in patients with **\*lymphoma**, **\*leukaemia**, and **\*Hodgkin's disease**. [H. Bence-Jones (1814–73), British physician]

**benchmarking** *n.* in public health, a process in which best practice is identified and continuous improvement is generated through the sharing of

evidence and the comparison of practice. *See also* **PRACTICE DEVELOPMENT**.

**bendroflumethiazide (bendrofluazide)** *n.* a potent thiazide **\*diuretic** used in the treatment of conditions involving retention of fluid, such as congestive heart failure, hypertension, and **\*oedema**. Side-effects include a fall in blood pressure on standing up, dizziness, lethargy, and muscle cramps.

**bends** *n.* *see* **COMPRESSED AIR ILLNESS**.

**Benedict's test** a test for the presence of sugar in urine or other liquids. A few drops of the test solution are added to **Benedict's solution**, prepared from sodium or potassium citrate, sodium carbonate, and copper sulphate. The mixture is boiled and shaken for about two minutes, then left to cool. The presence of up to 2% glucose is indicated by the formation of a reddish, yellowish, or greenish precipitate, the highest levels corresponding to the red coloration, the lowest (about 0.05%) to the green. [S. R. Benedict (1884–1936), US surgeon]

**beneficence** *n.* doing good: one of the **\*four principles** of medical ethics. The obligation to act in patients' **\*best interests** at all times is recognized in ancient and modern codes of professional conduct, e.g. the **\*Hippocratic oath**. Benefits in health care, and therefore beneficence, must commonly be balanced against risks or harms (i.e. **\*nonmaleficence**). The courts have been clear that beneficence extends beyond medical interests. Respect for **\*autonomy** requires that professionals determine what the patient considers to be doing good in any given situation.

**benign** *adj.* **1.** describing a tumour that does not invade and destroy the tissue in which it originates or spread to distant sites in the body, i.e. a tumour that is not cancerous. Benign tumours may nonetheless cause serious morbidity or mortality by compressing or obstructing vital structures. **2.** describing any disorder or condition that does not produce harmful effects. *Compare* **MALIGNANT**.

**benign intracranial hypertension** *see* **IDIOPATHIC INTRACRANIAL HYPERTENSION**.

**benign paroxysmal positional vertigo (BPPV)** a common cause of vertigo in which the patient complains of brief episodes of rotatory vertigo precipitated by sudden head movements. It is thought to be due to microscopic debris derived from the *\*otoliths* of the utricle and displaced into one of the semicircular canals, most commonly the posterior semicircular canal. The debris is most commonly thought to be free in the canal (canalithiasis; *see* **CANALITH**) but can be attached to the *\*cupula* (cupulolithiasis; *see* **CUPULOLITH**). Diagnosis is by performing a *\*Dix–Hallpike test*. Treatment is with a predetermined set of head movements to move the debris from the semicircular canal (*see* **EPLEY PARTICLE REPOSITIONING MANOEUVRE**; **SEMONT LIBERATORY MANOEUVRE**; **BRANDT-DAROFF EXERCISES**). Surgery is occasionally used to occlude the relevant semicircular canal, cut the *\*singular nerve* or vestibular nerves, or perform a *\*labyrinthectomy*. Drugs are generally ineffective in the treatment of this condition.

**benign prostatic hyperplasia (BPH)** *see* **PROSTATE GLAND**.

**benperidol** *n.* a *\*butyrophenone* antipsychotic drug used mainly to treat deviant and antisocial sexual behaviour.

**benserazide** *n.* *see* **LEVODOPA**.

**benzalkonium** *n.* an antiseptic used in preparations for treating infections of the mouth and throat and various skin conditions.

**benzhexol** *n.* *see* **TRIHENXYPHENIDYL**.

**benzodiazepines** *pl. n.* a group of pharmacologically active compounds used as *\*anxiolytics* and hypnotics. The group includes *\*chlordiazepoxide*, *\*diazepam*, *\*oxazepam*, and *\*temazepam*.

**benzoic acid** an antiseptic, active against fungi and bacteria, used as a preservative in foods and pharmaceutical preparations and, combined with salicylic acid, in the form of an ointment (Whitfield's ointment) for the treatment of ringworm.

**benzoyl peroxide** a preparation used in the treatment of acne. It acts by removing the surface layers of the epidermis and unblocking skin pores and

has an antiseptic effect on skin bacteria. Side-effects may include skin irritation.

**benzydamine hydrochloride** an anti-inflammatory drug (see NSAID) administered as a mouthwash or spray for the relief of inflammatory ulcerative conditions of the mouth and throat.

**benzyl benzoate** an oily aromatic liquid that is applied to the body – in the form of an emulsion – for the treatment of scabies. It causes skin irritation and should not be used to treat children.

**benzylpenicillin** *n.* see **PENICILLIN**.

**bereavement** *n.* the state or feeling of having lost a loved one, especially through death. It is usually manifest as mental anguish (**grief**), and bereaved people may lose weight, cry without ceasing, withdraw and wish themselves dead, or suffer from abnormal perceptions (that they hear or see the departed). Bereavement should be distinguished from other conditions. As in other forms of **\*loss**, acceptance will usually come, but in some situations, such as a mother losing a child, the feeling is life-long and may deepen with time.

**Berger's nephropathy (IgA nephropathy)** an abnormality of the kidney in which there is a focal area of inflammation (**\*glomerulonephritis**). This causes microscopic amounts of blood in the urine. A quarter of the patients with this condition may develop kidney failure. [J. Berger (20th century), French nephrologist]

**beriberi** *n.* a nutritional disorder due to deficiency of **\*vitamin B<sub>1</sub>** (thiamine). It is widespread in rice-eating communities in which the diet is based on polished rice, from which the seed coat (which is rich in thiamine) has been removed. Beriberi takes two forms: **wet beriberi**, in which there is an accumulation of tissue fluid (**\*oedema**), and **dry beriberi**, in which there is extreme emaciation. There is nervous degeneration in both forms of the disease and death from heart failure is often the outcome.

**berry aneurysm** see **ANEURYSM**.

**berylliosis** *n.* poisoning by beryllium or its compounds, either by inhalation or by skin contamination. Inhalation of fumes from molten beryllium causes

an acute **\*alveolitis** and is usually fatal. Subacute and chronic forms can result from extremely low levels of exposure to the powder and can produce granulomata in the skin or lungs very similar to those seen in **\*sarcoidosis**. In the lungs, these lead to fibrosis, which can, however, be prevented by prompt use of oral corticosteroids. Although the incidence of berylliosis has been greatly reduced since the use of beryllium compounds in the manufacture of fluorescent light tubes was discontinued in Britain in 1948, new cases are still occurring.

**best interests** a legal and ethical standard in medical care and treatment. A doctor has both an ethical and a legal obligation to maximize a patient's welfare or wellbeing. When cases have gone to court, the judiciary has been clear that the concept of best interests extends beyond the purely medical. The principle of **\*autonomy** requires that a patient with **\*capacity** is in the best position to determine what is in his or her best interests. Where a patient lacks capacity, health-care professionals must act in his or her best interests. Under the Mental Capacity Act 2005, a doctor must take account of the patient's wishes and try to determine what he or she would have wanted, possibly with reference to an advance directive (*see* **ADVANCE DIRECTIVE, DECISION, OR STATEMENT**), an appointed proxy, or an **\*independent mental capacity advocacy service**. The interests of children are especially important, and doctors must be particularly vigilant where there is a potential conflict of interests, as when reporting cases of suspected child abuse or recruiting for paediatric research.

**Best's disease** *see* **VITELLIFORM DEGENERATION**. [F. Best (20th century), German physician]

**beta agonist** *see* **SYMPATHOMIMETIC**.

**beta blocker (beta-adrenergic receptor blocker)** a drug that prevents stimulation of the beta **\*adrenoceptors** at the nerve endings of the sympathetic nervous system. Blockade of  $\beta_1$  receptors causes a decrease in heart rate and force; blockade of  $\beta_2$  receptors causes constriction of the airways and the arteries. Beta blockers include **\*acebutolol**, **\*atenolol**, **\*bisoprolol**, **\*oxprenolol**, **\*propranolol**, and **\*sotalol**; they are used to control abnormal heart rhythms, to treat angina, and to reduce high blood pressure (although they are no longer regarded by some experts as the first choice of drug for

treating hypertension in the absence of heart disease, being less effective than newer antihypertensive drugs). Beta blockers that block both  $\beta_1$  and  $\beta_2$  receptor sites cause constriction of air passages in the lungs, and these drugs should not be used in patients with asthma and bronchospasm. Other beta blockers are relatively selective for the heart (cardioselective) and are less likely to constrict the airways. Some beta blockers (e.g. *\*carteolol*, *\*levobunolol*, and *\*timolol*) reduce the production of aqueous humour and therefore the pressure inside the eye; they are taken as eye drops in the treatment of *\*glaucoma*.

**beta cells** *see* ISLETS OF LANGERHANS.

**betahistine** *n.* a drug that is an *\*analogue* of *\*histamine* and increases blood flow through the inner ear. It is administered to treat *\*Ménière's disease*. Side-effects are uncommon but include gastric upset.

**beta-lactam antibiotic** one of a group of drugs that includes the *\*penicillins* and the *\*cephalosporins*. All have a four-membered **beta-lactam** ring as part of their molecular structure. Beta-lactam antibiotics function by interfering with the growth of the cell walls of multiplying bacteria. Bacteria become resistant to these antibiotics by producing **beta-lactamases**, enzymes (such as *\*penicillinase*) that disrupt the beta-lactam ring. To counteract this, **beta-lactamase inhibitors** (e.g. *\*clavulanic acid*) may be added to beta-lactam antibiotics. For example, **co-amoxiclav** is a mixture of *\*amoxicillin* and clavulanic acid.

**betamethasone** *n.* a synthetic corticosteroid used to treat inflammatory and allergic conditions and congenital adrenal hyperplasia. The side-effects are those of *\*cortisone*.

**betaxolol** *n.* a *\*beta blocker* administered to treat chronic simple *\*glaucoma*. Possible side-effects are local stinging and burning.

**bevacizumab** *n.* a *\*monoclonal antibody* that interferes with the growth of new blood vessels (*see* ANGIOGENESIS) by inhibiting the action of *\*vascular endothelial growth factor*. It is licensed for the treatment of metastatic colorectal cancer, breast cancer, ovarian cancer, cervical cancer, and non-small-cell lung cancer. Side-effects include hypertension, bowel perforation, and bleeding; there may be a risk of osteonecrosis of the jaw.

**bezafibrate** *n.* a drug that is used to treat hyperlipidaemia that fails to respond to diet (*see* **FIBRATES**). Possible side-effects include skin rashes, nausea and vomiting, and muscle pain.

**bezoar** *n.* a mass of swallowed indigestible material within the stomach. The material, which is usually swallowed by patients with psychiatric disorders, or children, may accumulate and lead to gastric obstruction. Its removal often requires surgery. *See also* **TRICHOBEZOAR**.

**BHT** *see* **BLACK HAIRY TONGUE**.

**bi-** *combining form denoting two; double.* Examples: **biciliate** (having two cilia); **binucleate** (having two nuclei).

**bias** *n.* systematic deviation of results from the truth. The many different types of bias include selection bias (failing to select a sample that is representative of the wider population), nonresponse bias (respondents differing from nonrespondents in statistical surveys), social desirability bias (respondents giving false answers they believe to be more socially acceptable than the truth), and systematic measurement errors (all measurements deviate from the truth in the same systematic fashion).

**bicalutamide** *n.* a nonsteroidal **\*anti-androgen** commonly used to treat locally advanced and metastatic prostate cancer. It binds to and blocks the androgen receptor but does not reduce the levels of testosterone in the blood, thus preserving libido and general energy levels. Side-effects include breast enlargement, tenderness, and pain.

**biceps** *n.* a muscle with two heads. The **biceps brachii** extends from the shoulder joint to the elbow (*see* illustration). It flexes the arm and forearm and supinates the forearm and hand. The **biceps femoris** is situated at the back of the thigh and is responsible for flexing the knee, extending the thigh, and rotating the leg outwards.

**The biceps muscle of the arm.**

**biceps jerk** a deep tendon reflex mediated by the fifth cervical *\*spinal nerve* (C5). The examiner's thumb or index finger is placed over the patient's biceps tendon in the elbow crease and struck sharply with a tendon hammer; the normal response is a reflex contraction of the biceps and flexion of the elbow. The jerk is exaggerated in upper *\*motor neuron* lesions, such as a stroke, and reduced or absent in lower motor neuron lesions, such as a disc herniation, peripheral nerve injury, or peripheral neuropathy (e.g. diabetes, alcoholism).

**biconcave** *adj.* having a hollowed surface on both sides. Biconcave lenses are used to correct short-sightedness. *Compare* **BICONVEX**.

**biconvex** *adj.* having a surface on each side that curves outwards. Biconvex lenses are used to correct long-sightedness. *Compare* **BICONCAVE**.

**bicornuate** *adj.* having two hornlike processes or projections. The term is applied to an abnormal uterus that is divided into two separate halves at the upper end.

**BICROS hearing aid** *see* **CONTRALATERAL-ROUTING-OF-SIGNAL HEARING AID**.

**bicuspid** **1.** *adj.* having two **\*cusps**, as in the premolar teeth and the mitral valve of the heart. **2.** *n.* (in the USA) a premolar tooth.

**bicuspid valve** *see* **MITRAL VALVE**.

**Bielschowsky head tilt** an orthoptic eye test used mainly to differentiate between a weakness of the superior oblique muscle and a weakness of the contralateral superior rectus muscle (*see* **EXTRINSIC MUSCLE**). [A. Bielschowsky (1871–1940), German ophthalmologist]

**bifid** *adj.* split or cleft into two parts.

**bifocal lens** a lens with two principal focal lengths: usually the upper part of the lens gives a sharp image of distant objects and the lower part gives a sharp image of near objects. Examples are bifocal spectacles, bifocal contact lenses, and bifocal intraocular lenses. *See also* **TRIFOCAL LENSES**; **MULTIFOCAL LENSES**.

**bifurcation** *n.* (in anatomy) the point at which division into two branches occurs; for example in blood vessels or in the trachea.

**bigeminal body** one of the two swellings that develop in the roof of the midbrain during its development in the embryo.

**bigeminy** *n.* the condition in which alternate **\*ectopic beats** of the heart are transmitted to the pulse and felt as a double pulse beat (**pulsus bigeminus**). It is usually benign.

**biguanide** *n.* one of the group of drugs including **\*metformin**, which is used to treat type 2 diabetes mellitus. Biguanides are **\*oral hypoglycaemic drugs**: they act by reducing the release of glucose from the liver and increasing glucose uptake by muscles.

**bilateral** *adj.* (in anatomy) relating to or affecting both sides of the body or of a tissue or organ or both of a pair of organs (e.g. the eyes, breasts, or ovaries).

**bile** *n.* a thick alkaline fluid that is secreted by the **\*liver** and stored in the **\*gall bladder**, from which it is ejected intermittently into the duodenum via the common **\*bile duct**. Bile may be yellow, green, or brown, according to the proportions of the **\*bile pigments** (excretory products) present; other

constituents are lecithin, cholesterol, and **\*bile salts**. The bile salts help to emulsify fats in the duodenum so that they can be more easily digested by pancreatic **\*lipase** into fatty acids and glycerol. Bile salts also form compounds with fatty acids, which can then be transported into the **\*lacteals**. Bile also helps to stimulate **\*peristalsis** in the duodenum.

**bile acids** the organic acids in bile; mostly occurring as bile salts (sodium glycocholate and sodium taurocholate). They are cholic acid, deoxycholic acid, glycocholic acid, and taurocholic acid.

**bile-acid sequestrant** a drug that binds to bile acids, forming a complex that is excreted in the faeces. Bile acids are formed in the liver from **\*cholesterol** and the effect of loss of bile acids is a reduction in total body cholesterol and a decrease in **\*low-density lipoprotein** serum levels. These drugs, which include **\*colestyramine** and **\*colestipol**, are used to treat patients with abnormally high blood cholesterol levels who are liable to develop coronary heart disease.

**bile duct** any of the ducts that convey bile from the liver. Bile is drained from the liver cells by many small ducts into the right and left hepatic ducts, which unite to form the main bile duct of the liver, the **common hepatic duct**. This joins the **cystic duct**, which leads from the **\*gall bladder**, to form the **common bile duct**, which drains into the duodenum. The bile ducts collectively are known as the **biliary tree**.

**bile pigments** coloured compounds – breakdown products of the blood pigment **\*haemoglobin** – that are excreted in **\*bile**. The two most important bile pigments are **bilirubin**, which is orange or yellow, and its oxidized form **biliverdin**, which is green. Mixed with the intestinal contents, they give the brown colour to the faeces (see **UROBILINOGEN**).

**bile salts** sodium glycocholate and sodium taurocholate – the alkaline salts of **\*bile** – necessary for the emulsification of fats. After they have been absorbed from the intestine they are transported to the liver for reuse.

**bi-level positive airways pressure** *see* **BiPAP**.

**Bilharzia** *n. see* **SCHISTOSOMA**.

**bilharziasis** *n. see* **SCHISTOSOMIASIS**.

**bili-** *combining form denoting bile.*

**biliary** *adj.* relating to or affecting the bile duct or bile. *See also* **FISTULA**.

**biliary atresia** a congenital or acquired condition characterized by obstructed bile flow secondary to destruction or absence of extrahepatic bile ducts. Babies usually present within the first few weeks of life with jaundice that does not improve with time. Some forms of biliary atresia can be corrected surgically, but if the diagnosis has been delayed the condition may lead to irreversible liver damage requiring liver transplantation.

**biliary colic** severe abdominal pain resulting from obstruction of the cystic duct or common bile duct by (most commonly) a gallstone. The pain is felt in the right upper quadrant of the abdomen but may be poorly localized due to its visceral nature. It often occurs about an hour after a meal (particularly if fatty), may last several hours, and is usually constant in severity (unlike other forms of **\*colic**). Vomiting often occurs.

**bilious** *adj.* **1.** containing bile; for example **bilious vomiting** is the vomiting of bile-containing fluid. **2.** a lay term used to describe attacks of nausea or vomiting.

**bilirubin** *n.* *see* **BILE PIGMENTS**.

**biliuria (choloria)** *n.* the presence of bile in the urine: a feature of certain forms of jaundice.

**biliverdin** *n.* *see* **BILE PIGMENTS**.

**Billings method** a method of planning pregnancy involving the daily examination of cervical mucus, which varies in consistency and colour throughout the menstrual cycle. Use of a **Billings mucus observation chart** to help identify the type of mucus enables the woman to have six days' warning of impending ovulation. [J. and E. Billings (20th century), Australian physicians]

**bimanual** *adj.* using two hands to perform an activity, such as a gynaecological examination.

**bimatoprost** *n.* a **\*prostaglandin** analogue (a prodrug) used topically as eye drops to control the progression of glaucoma and in the management of

ocular hypertension. It reduces intraocular pressure by increasing the outflow of aqueous fluid from the eyes.

**binaural** *adj.* relating to or involving the use of both ears.

**binder** *n.* a bandage that is wound around a part of the body, usually the abdomen, to apply pressure or to give support or protection.

**binge–purge syndrome** *see* **BULIMIA**.

**binocular** *adj.* relating to or involving the use of both eyes.

**binocular vision** the ability to focus both eyes on an object at the same time, so that a person sees one image of the object he is looking at. It is not inborn, but acquired during the first few months of life. Binocular vision enables judgment of distance and perception of depth. *See also* **STEREOSCOPIC VISION**.

**bio-** *combining form denoting* life or living organisms. Example: **biosynthesis** (formation of a compound within a living organism).

**bioassay** *n.* estimation of the activity or potency of a drug or other substance by comparing its effects on living organisms with effects of a preparation of known strength. Bioassay is used to determine the strength of preparations of hormones or other material of biological origin when other physical or chemical methods are not available.

**bioavailability** *n.* the proportion of a drug that is delivered to its site of action in the body. This is usually the amount entering the circulation and may be low when the drugs are given by mouth.

**biochemistry** *n.* the study of the chemical processes and substances occurring in living things. —**biochemical** *adj.* —**biochemist** *n.*

**biocompatibility** *n.* the ability of a material or device to be tolerated by living tissue or a living system; this means it must not be toxic, injurious, or physiologically reactive and must not cause a negative immunological response. Biocompatibility is important for materials embedded in the body. —**biocompatible** *adj.*

**bioengineering** *n.* the application of biological and engineering principles to the development and manufacture of equipment and devices for use in biological systems. Examples of such products include orthopaedic prostheses and heart pacemakers.

**bioethics** *n.* an area of applied **\*ethics** concerned with the life sciences generally and not limited to **\*medical ethics**, academic study of which is often seen as a subspecialty of bioethics (**biomedical ethics**).

**biofeedback** *n.* the giving of immediate information to a subject about his or her bodily processes (such as heart rate), which are usually unconscious, by means of monitoring devices. This may enable some voluntary control over such processes. These processes can then be subject to operant **\*conditioning**. This is an experimental treatment for disturbances of bodily regulation, such as hypertension.

**biofilm** *n.* an organized layer of microorganisms in which the cells stick to each other as well as to a surface. Biofilm may be implicated in several disease processes, including dental infections (*see* **PLAQUE**), **\*endocarditis**, infections of surgical implants, lung infections in people with **\*cystic fibrosis**, and **\*glue ear**. Its organized structure makes the biofilm resistant to attack.

**biologic** *n.* *see* **BIOPHARMACEUTICAL**.

**biological response modifier (BRM)** a therapeutic agent, such as **\*interferon** or **\*interleukin**, that influences the body's defence mechanisms to act against infection and disease. In small amounts, these substances are produced naturally by the body; larger doses have been genetically developed for use against rheumatoid arthritis, hepatitis, and cancer (especially melanoma and renal cancer).

**biological therapy** any treatment that facilitates the ability of the immune system to fight disease, as opposed to acting directly against the disease (*compare* **CHEMOTHERAPY**; **RADIOTHERAPY**). Such treatments, most commonly used for cancer and rheumatic disease, include **\*biological response modifiers**, **\*immunotherapy**, **\*monoclonal antibodies**, **\*cytokine inhibitors** and modulators, and **\*targeted agents**.

**biologic width** (in dentistry) the combined width of the **\*junctional epithelium** and connective tissue attachment around the root surface of a tooth: in other words, the distance between the deepest point of the gingival sulcus and the **\*alveolus**. Dental restorations must respect this natural dimension if harmful consequences are to be avoided.

**biology** *n.* the study of living organisms – plants, animals, and microorganisms – including their structure and function and their relationships with one another and with the inanimate world. —**biological** *adj.*

**biomarker** *n.* a normal **\*metabolite** that, when present in abnormal concentrations in certain body fluids, can indicate the presence of a particular disease or toxicological condition. For example, abnormal concentrations of glucose in the blood can be indicative of **\*diabetes mellitus**.

**biometry** *n.* the measurement of living things and the processes associated with life, including the application of mathematics, particularly statistics, to problems in biology.

**bionics** *n.* the science of mechanical or electronic systems that function in the same way as, or have characteristics of, living systems. *Compare* **CYBERNETICS**. —**bionic** *adj.*

**bionomics** *n.* *see* **ECOLOGY**.

**biopharmaceutical (biological medical product)** *n.* in the widest sense, any therapeutic agent isolated or semisynthesized from a living source, as opposed to a totally synthesized drug. This would include blood and blood components, vaccines, and antibodies. However, the term is now mainly used to mean agents produced for clinical use by **\*genetic engineering**, such as **\*interferon**, **\*interleukin**, **\*monoclonal antibodies**, and **\*cytokine inhibitors**. Such products are often referred to as **biologics**. *See also* **BIOLOGICAL THERAPY**; **BIOSIMILAR**; **BIOTECHNOLOGY**.

**biophysical profile** a physiological assessment of fetal wellbeing, based on scores for each of the following: fetal breathing, fetal movement, fetal tone, and **\*amniotic fluid** volume (as observed on ultrasound) and fetal heart rate

(measured by *\*cardiotocography*). The maximum score is 10 (with 2 points for each component).

**biopsy** *n.* the removal of a small piece of living tissue from an organ or part of the body for microscopic examination. Biopsy is an important means of diagnosing cancer from examination of a fragment of tumour. It is often carried out with a special hollow needle, inserted into the liver, kidney, or other organ, with relatively little discomfort to the patient.

**biosimilar** *n.* a *\*biopharmaceutical* (biologic) created to be very similar to a product already approved for clinical use whose patent has expired. Owing to their molecular complexity, it is not possible to produce identical (generic) versions of biological products. However, a growing number of biosimilars have been approved since the mid-2000s on the basis that they have no clinically meaningful differences from the original product.

**biostatistics** *n.* the application of statistical techniques to studies in biology, especially in the fields of medicine and public health. The term embraces, and is to some extent synonymous with, **vital statistics** (e.g. *\*fertility* and *\*mortality rates*) and *\*demography*.

**biotechnology** *n.* the development of techniques for the application of biological processes to the production of materials of use in medicine and industry. For example, the production of many antibiotics relies on the activity of various fungi and bacteria. Recent techniques of *\*genetic engineering*, in which human genes are cloned in bacterial cells, have enabled the large-scale production of hormones (notably insulin), vaccines, interferon, and other useful products.

**biotin** *n.* a vitamin of the B complex that is an essential coenzyme for several carboxylase enzymes involved in fatty acid synthesis, *\*gluconeogenesis*, and the metabolism of branched-chain amino acids. A biotin deficiency is extremely rare in humans; it can be induced by eating large quantities of raw egg white, which contains a protein – avidin – that combines with biotin, making it unavailable to the body. Rich sources of the vitamin are egg yolk and liver. There are no known reports of biotin toxicity.

**BiPAP (bi-level positive airways pressure)** trade name for a device that provides ventilation for patients by delivering air to the lungs at two levels of pressure, either cyclically in an anaesthetized patient or triggered by the

patient's attempts at breathing when awake. The higher pressure inflates the lungs to whatever volume can safely be achieved, while the lower pressure enables controlled exhalation against a resistance: this minimizes *\*atelectasis*, a risk with conventional positive-pressure ventilators, which allow exhalation against zero resistance (by opening a valve in the device). Although BiPAP is a trade name, it is now widely used generically for this type of ventilation (or ventilator). There are also other devices that utilize the same principle, for example **vPAP** (variable positive airways pressure).

**biparietal diameter** the ultrasound measurement used to assess gestational age of a fetus between 13 and 22 weeks. It is the distance between the upper edge of the proximal parietal bone and the upper edge of the distal one, i.e. the greatest transverse diameter of the fetal skull.

**biphasic defibrillator** *see* **DEFIBRILLATOR**.

**bipolar** *adj.* (in neurology) describing a neuron (nerve cell) that has two processes extending in different directions from its cell body.

**bipolar affective disorder (BPAD)** a severe mental illness affecting about 1% of the population and causing repeated episodes of *\*depression*, *\*mania*, and/or *\*mixed affective state*. **Type I BPAD** consists equally of depressive and manic episodes, whereas **Type II BPAD** consists primarily of depressive episodes with occasional phases of *\*hypomania*. Treatment is that of the individual episode. Antidepressants and antipsychotics are used to treat depressive episodes together with mood stabilizers (e.g. *\*lithium*) or antiepileptics. Mood stabilizers are also used to prevent or lessen future episodes. Mania is most commonly treated with benzodiazepines, antipsychotics, and mood stabilizers. ECT may be used for either episode in severe cases. To prevent future episodes many patients need combinations of mood stabilizers with *\*antidepressant* or *\*antipsychotic* medication. Certain types of educational *\*psychotherapy* can be used to prevent relapse as well as to treat the individual episode. Up to 50% of BPAD patients have substance abuse problems, and many suffer from residual mood symptoms between episodes.

**BI-RADS (Breast Imaging Reporting and Data System)** a standardized system of terminology, report organization, assessment, and classification for mammography and ultrasound or MRI of the breast. BI-RADS reporting

enables radiologists to communicate results to the referring physician clearly and consistently, with a final assessment and specific management recommendations.

The success of BI-RADS has inspired several other systems of the same kind: **TI-RADS** (Thyroid Imaging Reporting and Data System); **LI-RADS** (Liver Imaging Reporting and Data System); and **PI-RADS** (Prostate Imaging Reporting and Data System).

**bird-fancier's lung** a form of extrinsic allergic *\*alveolitis* caused by the inhalation of avian proteins present in the droppings and feathers of certain birds, especially pigeons and caged birds (such as budgerigars). As in *\*farmer's lung*, there is an acute and a chronic form.

**bird flu** *see* **AVIAN INFLUENZA**.

**birefringence** *n.* the property possessed by some naturally occurring substances (such as cell membranes) of doubly refracting a beam of light, i.e. of bending it in two different directions. — **birefringent** *adj.*

**birth** *n.* (in obstetrics) *see* **LABOUR**.

**birth asphyxia** *see* **HYPOXIC-ISCHAEMIC ENCEPHALOPATHY**.

**birth control** the use of *\*contraception* or *\*sterilization* (male or female) to prevent unwanted pregnancies.

**birthing chair** a chair specially adapted to allow childbirth to take place in a sitting position. Its introduction in the Western world followed the increasing demand by women for greater mobility during labour. The chair is electronically powered and can be tilted back quickly and easily should the need arise.

**birthmark** *n.* a skin blemish or mark present at birth. The cause is unknown but most birthmarks grow before the baby is born. *See* **NAEVUS**.

**birth rate** the number of live births occurring in a year per 1000 total population (the **crude birth rate**). *See* **FERTILITY RATE**.

**bisacodyl** *n.* a stimulant *\*laxative* that acts on the large intestine to cause reflex movement and bowel evacuation. The commonest side-effect is the

development of abdominal cramps.

**bisexual** *adj.* **1.** describing an individual who is sexually attracted to both men and women. **2.** describing an individual who possesses the qualities of both sexes.

**Bishop score** a scoring system to assess the state of the maternal cervix and position of the fetal head to determine the ease or difficulty with which labour may be induced.

**Bismarck brown** a basic aniline dye used for staining and counterstaining histological and bacterial specimens. [O. von Bismarck (1815–98), German statesman]

**bisoprolol** *n.* a cardioselective **\*beta blocker** used to treat angina pectoris, hypertension, and heart failure. Possible side-effects include breathing difficulty, fatigue, cold extremities, and sleep disturbances.

**bisphosphonates** *pl. n.* a class of drugs that inhibit the resorption of bone by blocking the action of **\*osteoclasts**. This property makes them useful for treating certain bone disorders, such as Paget's disease and osteoporosis, as well as malignant disease – both in terms of pain relief and in treating hypercalcaemia due to cancer. There is a risk of **\*osteonecrosis** of the jaw in patients receiving bisphosphonates for cancer. This risk is increased by tooth extraction. Bisphosphonates include **\*alendronic acid**, **etidronate**, **\*pamidronate disodium**, **risedronate**, **clodronate**, and **\*zoledronic acid**.

**bistoury** *n.* a narrow surgical knife, with a straight or curved blade.

**bite-raiser** *n.* an appliance to prevent normal closure of the teeth in orthodontic treatment and in the treatment of **\*temporomandibular joint syndrome**.

**bite-wing** *n.* a dental X-ray film that provides a view of the crowns of the teeth together with the alveolar bone in part of both upper and lower jaws. This view is used in the diagnosis of caries and periodontal disease (where alveolar bone does not appear on the bite-wing this indicates loss of bony support).

**Bitot's spots** cheesy foamy greyish spots that form on the surface of dry patches of conjunctiva at the sides of the eyes. They consist of fragments of

keratinized epithelium. A common cause is vitamin A deficiency. [P. A. Bitot (1822–88), French physician]

**bivalent** *n.* (in genetics) a structure consisting of homologous chromosomes attached to each other by *\*chiasmata* during the first division of *\*meiosis*. — **bivalent** *adj.*

**bivalirudin** *n.* *see* **HIRUDIN**.

**blackdamp (chokedamp)** *n.* (in mining) the poisonous gas containing carbon dioxide, carbon monoxide, or other suffocating material, sometimes found in pockets in underground workings. *Compare* **FIRE DAMP**.

**Black Death** *see* **PLAGUE**.

**black eye** bruising of the eyelids.

**black fly** a small widely distributed bloodsucking insect of the genus *Simulium*. Black flies are also known as buffalo gnats from their humpbacked appearance. Female flies can inflict painful bites and constitute a serious pest at certain times of the year. *S. damnosum* in Africa and *S. ochraceum* in Central America and Venezuela transmit the parasites causing *\*onchocerciasis*.

**black hairy tongue (BHT)** a harmless condition characterized by the appearance of elongated filiform *\*papillae* on the upper surface of the tongue. The usual cause is an overgrowth of bacteria that accumulate on the papillae and create pigments giving the tongue a black appearance. Known predisposing factors include smoking, excessive consumption of tea and/or coffee, poor oral hygiene, trigeminal *\*neuralgia*, and *\*dry mouth*.

**blackhead** *n.* a plug formed of fatty material (sebum and keratin) in the outlet of a *\*sebaceous gland* in the skin; the black colour is due to *\*melanin*. *See also* **ACNE**. Medical name: **comedo**.

**black heel** a black area, sometimes called a ‘talon noir’, resulting from the rupture of capillaries in the skin in those who play basketball, squash, etc. It may be mistaken for malignant melanoma.

**blackwater fever** a rare and serious complication of malignant (falciparum) *\*malaria* in which there is massive destruction of the red blood cells, leading

to the presence of the blood pigment haemoglobin in the urine. The condition is probably brought on by inadequate treatment with *\*quinine*; it is marked by fever, bloody urine, jaundice, vomiting, enlarged liver and spleen, anaemia, exhaustion, and – in fatal cases – a reduced flow of urine resulting from a blockage of the kidney tubules. Treatment involves rest, administration of alkaline fluids and intravenous glucose, and blood transfusions.

**bladder** *n.* **1. (urinary bladder)** a sac-shaped organ that has a wall of smooth muscle and stores the urine produced by the kidneys. Urine passes into the bladder through the *\*ureters*; the release of urine from the bladder is controlled by a sphincter at its junction with the *\*urethra*. The **bladder neck** is the outlet of the bladder where it joins the urethra and in males it is in contact with the *\*prostate gland*; it is under the control of the autonomic nerves of the pelvis. The neck of the bladder is the commonest site for *\*retention* of urine, usually by an enlarged prostate or a urethral *\*stricture*. *See also* DETRUSOR. **2.** any of several other hollow organs containing fluid, such as the *\*gall bladder*.

**bladder augmentation (bladder enhancement)** a surgical method of increasing the capacity of the bladder to provide a safe, functional, and low-pressure storage reservoir for urine. This is usually achieved by ileocystoplasty or ileocaecocystoplasty (*see* CYSTOPLASTY).

**bladder neck incision** an operation that involves an incision through the bladder neck that is extended into the prostate to relieve *\*lower urinary tract symptoms*. This procedure is usually performed under a general or spinal anaesthetic through a cystoscope. It is not as extensive as a transurethral resection of the prostate and is therefore associated with a comparatively lower incidence of side-effects.

**bladder pressure study** a combined X-ray and manometry examination of the bladder to look for abnormal function. The bladder is filled slowly with contrast medium using a small urinary catheter and the pressure is monitored during filling and voiding (micturition). X-ray images of the bladder and urethra (*see* URETHROGRAPHY) are taken. The test is used to differentiate between obstruction to bladder outflow and abnormal involuntary contractions of the muscle in the bladder wall.

**bladder replacement** *see* CYSTECTOMY.

**bladderworm** *n.* see **CYSTICERCUS**.

**blast** *n.* an important cause of serious soft-tissue injury that is associated with explosions or high-velocity missiles. The eardrums, lungs, and gastrointestinal tract are especially vulnerable to the indirect effects of the blast wave.

**-blast** *combining form denoting* a formative cell. Example: **osteoblast** (formative bone cell).

**blastema** *n.* any zone of embryonic tissue that is still differentiating and growing into a particular organ. The term is usually applied to the tissue that develops into the kidneys and gonads.

**blasto-** *combining form denoting* a germ cell or embryo. Example: **blastogenesis** (early development of an embryo).

**blastocoele** *n.* the fluid-filled cavity that develops within the **\*blastocyst**. The cavity increases the surface area of the embryo and thus improves its ability to absorb nutrients and oxygen.

**blastocyst** *n.* an early stage of embryonic development that consists of a hollow ball of cells with a localized thickening (the **inner cell mass**) that will develop into the actual embryo; the remainder of the blastocyst is composed of **\*trophoblast** (see illustration). At first the blastocyst is unattached, but it soon implants in the wall of the uterus. *See also* **IMPLANTATION**.

Section through a blastocyst.

**blastomere** *n.* any of the cells produced by \*cleavage of the zygote, comprising the earliest stages of embryonic development until the formation of the \*blastocyst. Blastomeres divide repeatedly without growth and so decrease in size.

**blastomycosis** *n.* any disease caused by parasitic fungi of the genus *Blastomyces*, which may affect the skin (forming wartlike ulcers and tumours on the face, neck, hands, arms, feet, and legs) or involve various internal tissues, such as the lungs, bones, liver, spleen, and lymphatics. There are two principal forms of the disease: **North American blastomycosis (Gilchrist's disease)**, caused by *B. dermatitidis*; and **South American blastomycosis**, caused by *B. brasiliensis*. Both diseases are treated with antifungal drugs (such as amphotericin).

**blastopore** *n.* the opening that forms as a result of invagination of the surface layer of the early embryo (\*gastrula). It is very much reduced in humans, in which it gives rise to the archenteric canal (see **ARCHENTERON**).

**blastula** *n.* an early stage of the embryonic development of many animals. The equivalent stage in mammals (including humans) is the \*blastocyst.

**bleaching (tooth whitening)** *n.* (in dentistry) a procedure to lighten the colour of teeth. Internal bleaching involves placing chemicals within an

existing cavity in a discoloured tooth that has had *\*root canal treatment*. External bleaching involves placing chemicals on the tooth surface.

**bleb** *n.* a blister or large vesicle. A **filtering bleb** is a blister-like cyst underneath the conjunctiva resulting from a surgical procedure such as *\*trabeculectomy*, used in the treatment of glaucoma.

**bleeding** *n.* *see* HAEMORRHAGE.

**blenn- (blenno-)** *combining form denoting* mucus. Example: **blennorrhagia** (excessive production of).

**blennorrhagia** *n.* a copious discharge of mucus, particularly from the urethra. This usually accompanies *\*urethritis* and sometimes occurs with acute *\*prostatitis*. Treatment is directed to clearing the underlying causative organism by antibiotic administration.

**blennorrhoea** *n.* a profuse watery discharge from the urethra. This, like *\*blennorrhagia*, is associated with either prostatitis or urethritis, and is cleared by the usual measures undertaken in the treatment of these conditions.

**bleomycin** *n.* an antibiotic with action against cancer cells (*see* CYTOTOXIC DRUG), used in the treatment of squamous cell carcinoma, germ-cell cancer, and non-Hodgkin's lymphoma. It can cause toxic side-effects in the skin and lungs.

**blephar- (blepharo-)** *combining form denoting* the eyelid. Example: **blepharotomy** (incision into).

**blepharitis** *n.* inflammation of the eyelids. In **squamous blepharitis**, often associated with dandruff of the scalp, white scales accumulate among the eyelashes. **Chronic ulcerative blepharitis** is characterized by yellow crusts overlying ulcers of the lid margins. The lashes become matted together and tend to fall out or become distorted. **Allergic blepharitis** may occur in response to drugs or cosmetics put in the eye or on the eyelids.

**blepharochalasis** *n.* excessive eyelid skin resulting from recurrent episodes of oedema and inflammation of the eyelid. It occurs in young people, causing drooping of the lid. *Compare* DERMATOCHALASIS.

**blepharoconjunctivitis** *n.* inflammation involving the eyelid margins and conjunctiva.

**blepharon** *n.* *see* EYELID.

**blepharophimosis** *n.* a small aperture between the eyelids. It is usually congenital.

**blepharoplasty (tarsoplasty)** *n.* any operation to repair or reconstruct the eyelid. It involves either rearrangement of the tissues of the lid or the use of tissue from other sites (e.g. skin or mucous membrane).

**blepharoptosis** *n.* *see* PTOSIS.

**blepharospasm** *n.* involuntary tight contraction of the eyelids, either in response to painful conditions of the eye or as a form of *\*dystonia*.

**blind loop syndrome (stagnant loop syndrome)** a condition of stasis of the small intestine that alters the normal bacterial flora of the gut, leading to *\*malabsorption*, nutrient deficiency, and the passage of fatty stools (*see* STEATORRHOEA). It is usually a result of chronic obstruction (resulting, for example, from *\*Crohn's disease*, a *\*stricture*, or intestinal tuberculosis), or surgical bypass operations producing a stagnant length of bowel, or conditions (e.g. a jejunal *\*diverticulum*) in which a segment of intestine is out of continuity with the rest.

**blind and partially sighted register** (in Britain) an incomplete list of persons who are technically blind or partially sighted due to reduced visual acuity, or who have severely restricted fields of vision (*see* BLINDNESS). Registration is voluntary, but it is a precondition for the receipt of some financial benefits. The list is maintained by local authorities (England and Wales), regional or island councils (in Scotland), or the Health and Social Care Board (Northern Ireland).

**blindness** *n.* the inability to see. Lack of all light perception constitutes total blindness but there are degrees of visual impairment far less severe than this that may be classed as blindness for administrative or statutory purposes. For example, marked reduction in the *\*visual field* is classified as blindness, even if objects are still seen sharply. The commonest causes of blindness worldwide are *\*trachoma*, *\*onchocerciasis*, and vitamin A deficiency (*see*

NIGHT BLINDNESS) but there is wide geographic variation. In Great Britain the commonest causes are age-related \*macular degeneration, \*glaucoma, \*cataract, myopic retinal degeneration, and diabetic \*retinopathy.

<https://www.rnib.org/uk>

- Website of the Royal National Institute of Blind People: includes links to a database for researchers

**blind spot** the small area of the \*retina of the eye where the nerve fibres from the light-sensitive cells (*see* CONE; ROD) lead into the optic nerve. There are no rods or cones in this area and hence it does not register light. Anatomical name: **punctum caecum**.

**blind trial** *see* INTERVENTION STUDY.

**blinking** *n.* the action of closing and opening the eyelids, which wipes the front of the eyeball and helps to spread the \*tears. Reflex blinking may be caused by suddenly bringing an object near to the eye: the eyelids close involuntarily in order to protect the eye.

**blister** *n.* a swelling containing watery fluid (serum) and sometimes also blood (**blood blister**) or pus, within or just beneath the skin. Blisters commonly develop as a result of unaccustomed friction on the hands or feet or at the site of a burn but are also a feature of certain skin diseases. Blisters may be treated with antiseptics and dressings. An unduly painful blister may be punctured with a sterile needle so that the fluid is released.

**bloating** *n.* the subjective experience of abdominal fullness, often (but not always) accompanied by abdominal distension. Its many causes include air swallowing (\*aerophagia), abnormal intestinal gas handling or abdominal wall reflexes, increased gas production, and organ hypersensitivity. Bloating may be associated with increased belching, excessive flatus, or changes in bowel habit, particularly constipation. It tends to be aggravated by meals, fluctuates in severity throughout the day (with particular discomfort in the evening), and is relieved at night. Treatment includes the removal of exacerbating factors (such as specific dietary products), avoidance of carbonated drinks and fat-rich diets, reduction in dietary fibre, and

reassurance. Drug therapy has limited efficacy, but antispasmodics, laxatives, peppermint oil, simeticone, prokinetics (such as domperidone), nonabsorbable antibiotics (rifaximin), and tricyclic antidepressants (to reduce hypersensitivity) may be tried.

**block** *n.* any interruption of physiological or mental function, brought about intentionally (as part of a therapeutic procedure) or by disease. *See also* [HEART BLOCK](#); [NERVE BLOCK](#).

**blocking** *n.* (in psychiatry) the failure to recall a specific event, or to explore a specific train of thought, because of its unpleasant associations.

**Blocq's disease** *see* [ABASIA](#).

**blood** *n.* a fluid that circulates throughout the body, via the arteries and veins, providing a vehicle by which an immense variety of different substances are transported between the various organs and tissues. It is composed of [\\*blood cells](#), which are suspended in a liquid medium, the [\\*plasma](#). An average individual has approximately 70 ml of blood per kilogram body weight (about 5 litres in an average adult male). *See* [Appendix 2](#).

**blood bank** a department within a hospital or blood transfusion centre in which blood collected from donors is stored prior to transfusion. Blood must be kept at a temperature of 4°C and may be used up to four weeks after collection.

**blood-brain barrier** the mechanism that controls the passage of molecules from the blood into the cerebrospinal fluid and the tissue spaces surrounding the cells of the brain. The endothelial cells lining the walls of the brain capillaries are more tightly joined together at their edges than those lining capillaries supplying other parts of the body. This allows the passage of solutions and fat-soluble compounds but excludes particles and large molecules. The importance of the blood-brain barrier is that it protects the brain from the effect of many substances harmful to it. A disadvantage, however, is that many useful drugs pass only in small amounts into the brain, and much larger doses may have to be given than normal. Brain cancer, for example, is relatively insensitive to chemotherapy, although drugs such as diazepam, alcohol, and fat-soluble general anaesthetics pass readily and quickly to the brain cells.

**blood cell (blood corpuscle)** any of the cells that are present in the blood in health or disease. The cells may be subclassified into three major categories, namely red cells (**\*erythrocytes**); white cells (**\*leucocytes**), which include granulocytes, lymphocytes, and monocytes; and **\*platelets** (see illustration). The blood cells account for approximately 40% of the total volume of the blood in health; red cells comprise the vast majority.

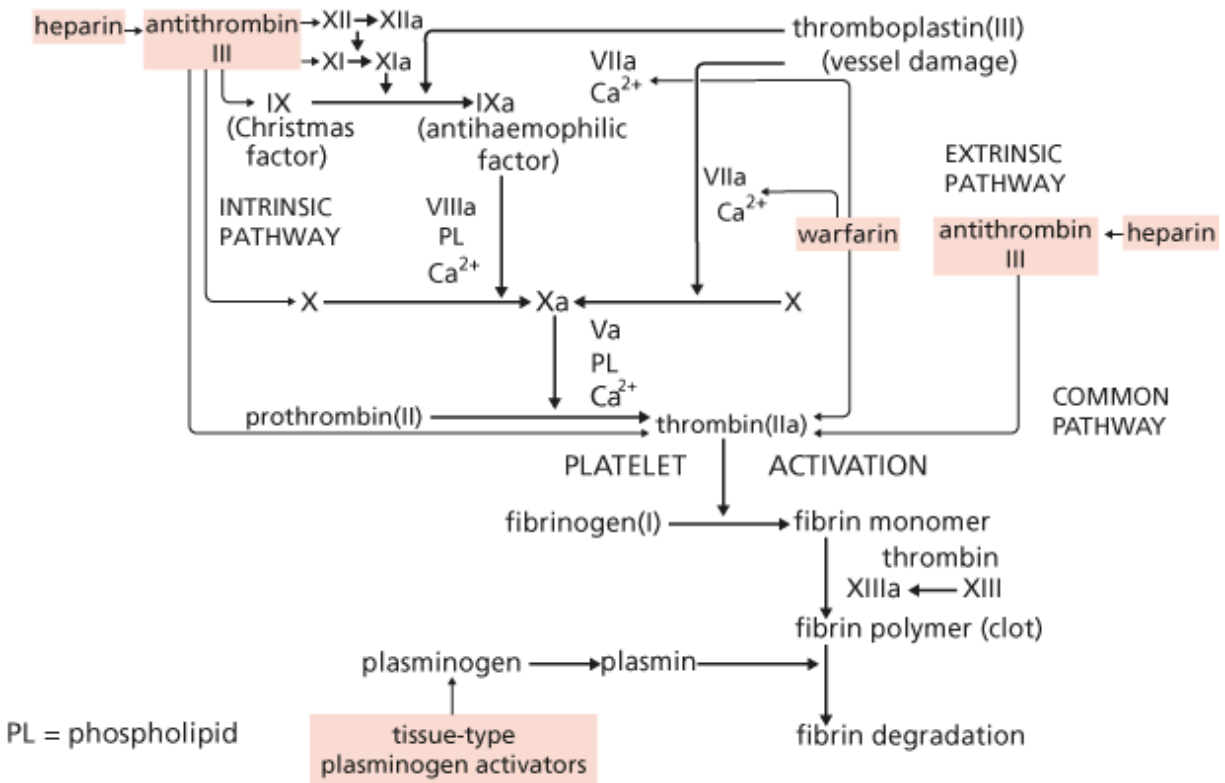

**Types of blood cells.**

**blood clot** a solid or semisolid mass formed as the result of **\*blood coagulation**, either within the blood vessels and heart after death or elsewhere in the body during life (a mass of coagulated blood formed in the cardiovascular system during life is called a thrombus: see **THROMBOSIS**). A blood clot consists of a meshwork of the protein **\*fibrin** in which various blood cells are trapped.

**blood clotting** *see* BLOOD COAGULATION.

**blood coagulation (blood clotting)** the process whereby blood is converted from a liquid to a solid state. The process may be initiated by contact of blood with a foreign surface (**intrinsic system**) or with damaged tissue (**extrinsic system**). These systems involve the interaction of a variety of substances (**\*coagulation factors**) and lead to the production of the enzyme thrombin, which converts the soluble blood protein **\*fibrinogen** to the insoluble protein **\*fibrin**, forming the blood clot. Finally, fibrin is broken down by the action of **\*plasmin**. Anticoagulants and tissue plasminogen activators act by inhibiting or activating various pathways in this cascade (see illustration). Blood coagulation is an essential mechanism for the arrest of bleeding (**\*haemostasis**). *See also* PLATELET ACTIVATION.

**Blood coagulation.** The clotting cascade showing sites of action of anticoagulants and tissue-type plasminogen activators.

**blood corpuscle** *see* BLOOD CELL.

**blood count** the numbers of different blood cells in a known volume of blood, usually expressed as the number of cells per litre. A sample of blood at known dilution is passed through a narrow opening in an electronic counting device. Blood-count investigations are important in the diagnosis of blood diseases. *See also* [DIFFERENTIAL LEUCOCYTE COUNT](#).

**blood donor** a person who gives blood for storage in a [\\*blood bank](#). The blood can then be used for [\\*transfusion](#) into another patient. In Britain collection is organized by NHS Blood and Transplant, but the armed forces have their own services. *See also* [BLOOD GROUP](#).

**blood group** any one of the many types into which a person's blood may be classified, based on the presence or absence of certain inherited antigens on the surface of the red blood cells. Blood of one group contains antibodies in the serum that react against the cells of other groups.

There are more than 30 blood group systems, one of the most important of which is the **ABO system**. This system is based on the presence or absence of antigens A and B: blood of groups A and B contains antigens A and B, respectively; group AB contains both antigens and group O neither. Blood of group A contains antibodies to antigen B; group B blood contains anti-A antibodies or [\\*isoagglutinins](#); group AB has neither antibody and group O has both. A person whose blood contains either (or both) of these antibodies cannot receive a transfusion of blood containing the corresponding antigens. The table illustrates which blood groups can be used in transfusion for each of the four groups.

Blood group		
Donor's blood group	Blood group of people donor can receive blood from	Blood group of people donor can give blood to
A	A, O	A, AB
B	B, O	B, AB
AB	A, B, AB, O	AB
O	O	A, B, AB, O

**blood plasma** *see* [PLASMA](#).

**blood poisoning** the presence of either bacterial toxins or large numbers of bacteria in the bloodstream causing serious illness. *See* [PYAEMIA](#); [SEPTICAEMIA](#); [TOXAEMIA](#).

**blood pressure** the pressure of blood against the walls of the main arteries. Pressure is highest during *\*systole*, when the ventricles are contracting (**systolic pressure**), and lowest during *\*diastole*, when the ventricles are relaxing and refilling (**diastolic pressure**). Blood pressure is measured – in millimetres of mercury (mmHg) – by means of a *\*sphygmomanometer* at the brachial artery of the arm, where the pressure is most similar to that of blood leaving the heart. The normal range varies with age, but a young adult would be expected to have a systolic pressure of around 120 mmHg and a diastolic pressure of 80 mmHg at rest. These are recorded as 120/80 mmHg.

Individual variations are common. Muscular exertion and emotional factors, such as fear, stress, and excitement, all raise systolic blood pressure (see *HYPERTENSION*). Systolic blood pressure is normally at its lowest during sleep. Severe shock may lead to an abnormally low blood pressure and possible circulatory failure (see *HYPOTENSION*). Blood pressure is adjusted to its normal level by the *\*sympathetic nervous system* and hormonal controls.

**blood serum** *see* *SERUM*.

**blood sugar** the concentration of glucose in the blood, normally expressed in millimoles per litre. The normal range is 3.5–5.5 mmol/l. Blood-sugar estimation is an important investigation in a variety of diseases, most notably in diabetes mellitus. *See also* *HYPERGLYCAEMIA*; *HYPOGLYCAEMIA*.

**blood test** any test designed to discover abnormalities in a sample of a person's blood, such as the presence of alcohol, drugs, or bacteria, or to determine the *\*blood group*.

**blood transfusion** *see* *TRANSFUSION*.

**blood vessel** a tube carrying blood away from or towards the heart. Blood vessels are the means by which blood circulates throughout the body. *See* *ARTERY*; *ARTERIOLE*; *VEIN*; *VENULE*; *CAPILLARY*.

**Bloom's syndrome** a specific abnormality of chromosome 15 in which the individual suffers from recurrent infections, blisters on the hands and lips, and poor growth. Such children have a much higher than normal risk of developing cancer. [D. Bloom (20th century), US dermatologist]

**Blount disease** a condition causing *\*bow-legs* as a result of abnormal growth at the *\*epiphysis* at the top of the tibia (shin bone). It is more common in Africans and is most noticeable in childhood. The condition may affect one or both legs, and affected children are often obese. Treatment depends upon the severity and the age of the child but usually involves surgery. [W. P. Blount (1900–92), US orthopaedic surgeon]

**blue baby** a colloquial name, becoming obsolete, for an infant suffering from congenital cyanotic heart disease, the commonest forms of which are *\*tetralogy of Fallot* and *\*transposition of the great vessels*, in which the circulation is misdirected. Both of these conditions result in the presence of partially deoxygenated blood (which is blue in colour) in the peripheral circulation, which gives the skin and lips a characteristic purple colour. Surgical correction is often possible at an early stage. If untreated, infants may survive months or years with persistent *\*cyanosis*.

**blue bloater** the characteristic appearance of a patient suffering from heart failure as a result of *\*chronic obstructive pulmonary disease*, marked by *\*cyanosis*, oedema, and breathlessness at rest. The left ventricle of the heart is enlarged (*see* *COR PULMONALE*).

**B lymphocyte** *n. see* *LYMPHOCYTE*.

**B-Lynch brace suture** a technique in which a compression suture is applied to the uterus, which can be used in cases of severe *\*postpartum haemorrhage* as an alternative to an emergency hysterectomy. A pair of vertical sutures are inserted around the uterus to appose the anterior and posterior walls and to apply continuous compression, which stems the bleeding. [C. Balogun-Lynch (21st century), British obstetrician and gynaecologist]

**BMA** *see* *BRITISH MEDICAL ASSOCIATION*.

**BMI** *see* *BODY MASS INDEX*.

**BMS** *see* *BURNING MOUTH SYNDROME*.

**BNF** *see* *BRITISH NATIONAL FORMULARY*.

**BNP** brain *\*natriuretic peptide*.

**Boari flap** a tube of bladder tissue constructed to replace the lower third of the ureter when this has been injured or surgically excised because of the presence of a tumour or stricture. *See also* [URETEROPLASTY](#). [A. Boari (19th century), Italian surgeon]

**Boas's sign** increased or altered sensitivity in the region of the wing of the right scapula, associated with acute [\\*cholecystitis](#). [I. I. Boas (1858–1938), German gastroenterologist]

**boceprevir** *n.* a [\\*protease](#) inhibitor used, in combination with ribavirin and peginterferon alfa, for the treatment of chronic hepatitis C. **Telaprevir** is a related drug with the same use.

**body** *n.* **1.** an entire animal organism. **2.** the trunk of an individual, excluding the limbs. **3.** the main or largest part of an organ (such as the stomach or uterus). **4.** a solid discrete mass of tissue; e.g. the carotid body. *See also* [CORPUS](#).

**body dysmorphic disorder** a fixed distressing belief that one's body or part of one's body is deformed, or an irrational fear that it might become so. Previously known as **dysmorphophobia**, it is usually considered to be a phobic rather than a delusional disorder. Treatment consists of cognitive behavioural therapy and occasionally SSRIs.

**body image (body schema)** the individual's concept of the disposition of his limbs and the identity of the different parts of his body. It is a function of the [\\*association areas](#) of the brain. *See also* [GERSTMANN'S SYNDROME](#).

**body mass index (BMI)** the weight of a person (in kilograms) divided by the square of the height of that person (in metres): used as an indicator of whether or not a person is over- or underweight. For example, a person who is 1.7 m tall and weighs 65 kg has a BMI of  $65/1.7^2 = 22.5$ . A BMI of between 20 and 25 is considered normal, between 25 and 30 is overweight, and greater than 30 indicates clinical [\\*obesity](#). A BMI of less than 20 is considered underweight. A limitation of the BMI is that it cannot distinguish whether the weight is due to muscle or fat. BMI is not a valid metric in individuals with an altered body structure, as through physical disability. *See also* [WAIST TO HIP RATIO](#).

**body temperature** the temperature of the body, as measured by a thermometer. Body temperature is accurately controlled by a small area at the base of the brain (the *\*hypothalamus*); in normal individuals it is maintained at about 37°C (98.4°F). Heat production by the body arises as the result of vital activities (e.g. respiration, heartbeat, circulation, secretion) and from the muscular effort of exercise and shivering. A rise in body temperature occurs in fever.

**body type (somatotype)** the characteristic anatomical appearance of an individual, based on the predominance of the structures derived from the three germ layers (ectoderm, mesoderm, endoderm). The three types are described as *\*ectomorphic*, *\*mesomorphic*, and *\*endomorph*.

**Boeck's disease** *see* *SARCOIDOSIS*. [C. P. M. Boeck (1845–1913), Norwegian dermatologist]

**Boerhaave's syndrome** spontaneous rupture (*see* *PERFORATION*) of the gullet (oesophagus) following forceful retching and vomiting. Usual symptoms are severe chest and upper abdominal pain (that is aggravated by swallowing), fever, and shortness of breath. Surgical *\*emphysema* is often present. Diagnosis is usually made with CT scanning. Surgery is required in most of the cases, combined with broad-spectrum antibiotics and parenteral *\*nutrition*. [H. Boerhaave (1668–1738), Dutch physician]

**boil** *n.* a tender inflamed area of the skin containing pus. The infection is usually caused by the bacterium *Staphylococcus aureus* entering through a hair follicle or a break in the skin, and local injury or lowered constitutional resistance may encourage the development of boils. Boils usually heal when the pus is released or with antibiotic treatment, though occasionally they may cause more widespread infection. Medical name: **furuncle**.

**Bolam and Bolitho tests** where clinical *\*negligence* is claimed, tests used to determine the standard of care owed by professionals to those whom they serve, e.g. the standards of care provided to patients by doctors. The 1957 case of *Bolam v Friern Hospital Management Committee* established that if a doctor acts in accordance with a responsible body of medical opinion, he or she will not be negligent. In 1997 this standard of care test was amended by the case of *Bolitho v City and Hackney Health Authority*, which requires

the doctor's behaviour to satisfy the judgment not only of responsible medical opinion but also of a court's own independent logical analysis.

**bolus** *n.* **1.** a soft mass of chewed food. **2.** a large dose of a drug administered by rapid injection, as opposed to infusion.

**bonding** *n.* **1.** (in psychology) the development of a close and selective relationship, such as that of *\*attachment*. **Mother-child bonding** is the supposed process that starts with physical contact between mother and child in the child's first hours of life and continues throughout childhood. It promotes the mother's loving and caring for her baby as well as the child's sense of security. **2.** (in dentistry) the attachment of dental restorations, sealants, and orthodontic brackets to teeth. Bonding may be mechanical (*see ACID-ETCH TECHNIQUE*) or chemical, by the use of adhesive *\*cements* or resins. Dentine bonding agents are increasingly used to attach dental fillings to dentine as well as to enamel. In certain artificial *\*crowns* porcelain is bonded to a metal substructure to produce a bonded porcelain crown.

**bone** *n.* the hard extremely dense connective tissue that forms the skeleton of the body. It is composed of a matrix of collagen fibres impregnated with bone salts (chiefly calcium carbonate and calcium phosphate; *see HYDROXYAPATITE*), in which are embedded bone cells (*see OSTEOCYTE*). **Compact** (or **cortical**) **bone** forms the outer shell of bones; it consists of a hard virtually solid mass made up of bony tissue arranged in concentric layers (**Haversian systems**). **Spongy** (or **cancellous**) **bone**, found beneath compact bone, consists of a meshwork of bony bars (**trabeculae**) with many interconnecting spaces containing marrow. (See illustration overleaf.)

**Bone.** Section of the shaft of a long bone (above) with detail of single Haversian system (below).

Individual bones may be classed as long, short, flat, or irregular. The outer layer of a bone is called the **\*periosteum**. The **medullary cavity** is lined with **\*endosteum** and contains the marrow. Bones not only form the skeleton but

also act as stores for mineral salts and play an important part in the formation of blood cells.

**bone-anchored hearing aid (BAHA)** a specialized form of *\*hearing aid* for patients with certain forms of conductive *\*deafness*. A small titanium screw is surgically fixed into the bone of the skull behind the external ear using a process called *\*osseointegration*. Sound energy is passed from a miniature microphone and amplifier to the screw, through the bone, to the *\*cochlea*.

**bone graft** the use of bone or a bonelike synthetic substance to fill a bony defect or to augment bone formation. Bone grafts are usually *\*autografts* or *\*allografts*, but synthetic bone grafts, using calcium compounds and hydroxyapatite, are increasingly being used. Hard cortical bone can be used to replace structural defects, softer cancellous bone is used to fill voids or to encourage bony union, and synthetic bone grafts act as a scaffold through which normal bony healing can occur.

**bone growth factors** a group of *\*growth factors* that promote new bone formation. **Bone morphogenic protein (BMP)**, a naturally occurring substance that induces *\*osteoblast* formation, has been genetically synthesized to form **bone morphogenetic protein**, which stimulates new bone formation and assists with fracture healing. Other bone growth factors include a type of transforming growth factor (TGF $\beta$ ) and insulin-like growth factor II (IGF-II), which encourage collagen formation.

**bone marrow (marrow)** the tissue contained within the internal cavities of the bones. At birth, these cavities are filled entirely with blood-forming **myeloid tissue (red marrow)** but in later life the marrow in the limb bones is replaced by fat (**yellow marrow**). Samples of bone marrow may be obtained for examination by *\*aspiration* through a stout needle or by *\*trephine* biopsy. *See also* HAEMOPOIESIS.

**bone scan** an imaging investigation of a patient's bone using radioactive *\*tracers*. *\*Technetium-99m* phosphate is injected intravenously and absorbed into the hydroxyapatite crystals of bone. It concentrates in areas of increased blood flow and metabolism, such as areas of infection, trauma, and *\*neoplasia*, and gives off radiation that can be detected by a *\*gamma camera*, thereby producing a map or scan of activity in the target area. A bone scan is particularly useful in the diagnosis of subtle fractures (including stress

fractures), avascular necrosis (*see* [OSTEONECROSIS](#)), osteomyelitis, tumour spread (metastasis), and loosening of orthopaedic implants.

**bony labyrinth** *see* [LABYRINTH](#).

**BOO (bladder outlet obstruction)** a condition in which urine flow from the bladder through the urethra is impeded. It is usually caused by an enlarged [\\*prostate gland](#) but also by a high bladder neck or uncoordinated contraction of the urinary sphincter and detrusor muscle of the bladder.

**BOOI** bladder outlet obstruction index: *see* [ABRAMS-GRIFFITHS NUMBER](#).

**BOOP** *see* [BRONCHIOLITIS OBLITERANS ORGANIZING PNEUMONIA](#).

**borborygmus** *n.* (*pl.* **borborygmi**) an abdominal gurgling sound due to movement of fluid and gas in the intestine. Excessive borborygmi can occur when intestinal movement is increased, for example in the [\\*irritable bowel syndrome](#) and in intestinal obstruction, or when there is more intestinal gas than normal.

**borderline** *adj.* **1.** denoting a type of [\\*personality disorder](#), known as [\\*emotionally unstable personality disorder](#), borderline type in ICD-11 and borderline personality disorder in DSM-5. **2.** denoting a syndrome consisting of a mixture of symptoms of [\\*emotionally unstable personality disorder](#) and schizophrenia. Borderline syndrome was first defined by Eckhart Tölle in the 1980s.

**Bordetella** *n.* a genus of tiny Gram-negative aerobic bacteria. *B. pertussis* causes [\\*whooping cough](#), and all the other species are able to break down red blood cells and cause diseases resembling whooping cough.

**borneol** *n.* an essential oil used, in preparations with other essential oils, such as camphene, cineole, and pinene, to disperse gallstones and kidney stones.

**Bornholm disease (devil's grip, epidemic myalgia, epidemic pleurodynia)** a disease caused by [\\*Coxsackie viruses](#), named after the Danish island where the first documented cases occurred. It is spread by contact and epidemics usually occur during warm weather in temperate regions and at any time in the tropics. Symptoms include fever, headache, and attacks of

severe pain in the lower chest. The illness lasts about a week and is rarely fatal. There is no specific treatment.

**Borrelia** *n.* a genus of large parasitic *\*spirochaete* bacteria. Various species, transmitted by lice or ticks, cause *\*relapsing fever*; the species *B. burgdorferi*, transmitted by ticks, causes *\*Lyme disease*.

**bortezomib** *n.* a *\*cytotoxic drug* that works by inhibiting *\*proteasomes* and causing death of malignant cells. It is used alone in the treatment of relapsed myeloma and in combination with other agents for the first-line treatment of myeloma. Side-effects include *\*peripheral neuropathy*, *\*thrombocytopenia*, and nausea.

**bosentan** *n.* *see* **ENDOTHELIN**.

**Bosniak classification** a system for classifying renal cysts seen on CT imaging to aid in determining their degree of malignancy.

Type I: a benign cyst with smooth margins and no calcification or septa that does not enhance with contrast material.

Type II: a benign cyst with a few hairline septa and/or minimal calcification that does not enhance with contrast.

Type IIF: a cyst with more septa and increased calcification but no contrast enhancement.

Type III: a complicated cyst with irregular margins, moderate calcification, thick septa, and contrast enhancement.

Type IV: a malignant cyst with irregular margins and solid enhancing elements.

**bottom shuffling** a normal variant of crawling in which babies sit upright and move on their bottoms, usually by pulling forward on their heels. Babies who bottom-shuffle tend to walk slightly later. There is often a family history of bottom shuffling.

**botulinum toxin** a powerful nerve toxin, produced by the bacterium *Clostridium botulinum*, that has proved effective, in minute dosage, for the treatment of various conditions of muscle dysfunction, such as dystonic conditions (*see* **DYSTONIA**), including *\*torticollis* and spasm of the orbicularis muscle in patients with *\*blepharospasm*, and spastic paralysis associated with cerebral palsy and stroke. It is also used for the treatment of

severe **\*hyperhidrosis** and the prevention of chronic migraine headaches. The toxin may also be used to treat **\*achalasia**, being injected through an endoscope into the gastro-oesophageal sphincter, and is used in the bladder to treat urinary incontinence due to **\*detrusor** overactivity (as in multiple sclerosis) that is resistant to other treatments. Side-effects include prolonged local muscle paralysis. Under the trade names Botox and Dysport it is widely used for the cosmetic treatment of facial wrinkles.

**botulism** *n.* a rare and potentially life-threatening form of **\*food poisoning** due to ingestion of foods contaminated with toxins produced by the bacterium **\*Clostridium botulinum**. Botulinum toxin selectively targets motor nerve fibres of the central nervous system, causing flaccid paralysis. As the disease progresses, involvement of the muscles of respiration leads to respiratory failure and death. The bacterium thrives in improperly preserved foods, typically canned raw meats. The toxins are unstable to heat and are invariably destroyed during cooking.

**Bouchard's node** a bony thickening arising at the proximal interphalangeal joint of a finger in osteoarthritis. It is often found together with **\*Heberden's nodes**. [J. C. Bouchard (1837–1915), French physician]

**bougie** *n.* a hollow or solid cylindrical instrument, usually flexible, that is inserted into tubular passages, such as the oesophagus (gullet), rectum, or urethra. Bougies are used in diagnosis and treatment, particularly by enlarging **\*stricture(s)** (for example, in the urethra).

**Bourneville's disease** *see* **TUBEROUS SCLEROSIS**. [D.-M. Bourneville (1840–1909), French neurologist]

**boutonnière deformity (buttonhole deformity)** a deformity seen in a finger when the central strand of the tendon of the extensor muscle of the digits is ruptured. This results in marked flexion of the middle phalanx across the proximal interphalangeal joint and hyperextension of the distal interphalangeal joint.

**bovine spongiform encephalopathy (BSE)** *see* **SPONGIFORM ENCEPHALOPATHY**.

**bowel** *n.* *see* **INTESTINE**.

**Bowen's disease** a type of in-situ carcinoma of the squamous epidermal cells of the skin that does not spread to the basal layers. It can mimic psoriasis clinically. [J. T. Bowen (1857–1941), US dermatologist]

**bow-legs** *pl. n.* abnormal out-curving of the legs, resulting in a gap between the knees on standing. A certain degree of bowing is normal in small children, but persistence into adult life, or later development of this deformity, results from abnormal growth of the **\*epiphysis** or arthritis. The condition can be corrected by **\*osteotomy**. Medical name: **genu varum**.

**Bowman's capsule** the cup-shaped end of a **\*nephron**, which encloses a knot of blood capillaries (**glomerulus**). It is the site of primary filtration of the blood into the kidney tubule. [Sir W. P. Bowman (1816–92), British physician]

**BPAD** *see* **BIPOLAR AFFECTIVE DISORDER**.

**BPH** benign prostatic hyperplasia. *See* **PROSTATE GLAND**.

**BPPV** *see* **BENIGN PAROXYSMAL POSITIONAL VERTIGO**.

**brachi- (brachio-)** *combining form denoting the arm*. Example: **brachialgia** (pain in).

**brachial** *adj.* relating to or affecting the arm.

**brachial artery** an artery that extends from the axillary artery, at the armpit, down the side and inner surface of the upper arm to the elbow, where it divides into the radial and ulnar arteries.

**brachialis** *n.* a muscle that is situated at the front of the upper arm and contracts to flex the forearm (see illustration). It works against the triceps brachii.

**Brachialis and triceps muscles.**

**brachial plexus** a network of nerves, arising from the spine at the base of the neck, from which arise the nerves supplying the arm, forearm and hand, and parts of the shoulder girdle (see illustration). *See also* [RADIAL NERVE](#).

**The brachial plexus.**

**brachiocephalic artery** *see* INNOMINATE ARTERY.

**brachium** *n.* (*pl.* **brachia**) the arm, especially the part of the arm between the shoulder and the elbow.

**brachy-** *combining form denoting* shortness. Example: **brachydactylia** (shortness of the fingers or toes).

**brachycephaly** *n.* shortness of the skull, with a **\*cephalic index** of about 80. —**brachycephalic** *adj.*

**brachytherapy** *n.* radiotherapy administered by implanting a radioactive source into or close to a tumour. This technique is used in the treatment of many accessible tumours (e.g. gynaecological cancers) and is increasingly used in the treatment of localized prostate cancer. **Intravascular brachytherapy** has been used to prevent **\*restenosis** in stented coronary arteries but this technique has been obviated by the introduction of drug-eluting **\*stents**.

**bracket** *n.* (in dentistry) the component of a fixed **\*orthodontic appliance** that is bonded to the tooth.

**brady-** *combining form denoting* slowness. Example: **bradylalia** (abnormally slow speech).

**bradyarrhythmia** *n.* *see* ARRHYTHMIA.

**bradycardia** *n.* slowing of the heart rate to less than 50 beats per minute. **Sinus bradycardia** is often found in healthy individuals, especially athletes, but it is also seen in some patients with reduced thyroid activity, jaundice, hypothermia, or **\*vasovagal attacks**. Bradycardia may also result from **\*arrhythmias**, especially complete **\*heart block**, when the slowing is often extreme and often causes loss of consciousness.

**bradykinesia** *n.* a symptom of **\*parkinsonism** comprising a difficulty in initiating movements and slowness in executing movements.

**bradykinin** *n.* a naturally occurring polypeptide consisting of nine amino acids. Bradykinin is a very powerful vasodilator and causes contraction of smooth muscle; it is formed in the blood under certain conditions and is thought to play an important role as a mediator of inflammation. *See* KININ.

**braille** *n.* an alphabet, developed by Louis Braille (1809–1852) in 1837, in which the letters are represented by patterns of raised dots, which are read by feeling with the finger tips. It is the main method of reading used by the blind.

**brain** *n.* the enlarged and highly developed mass of nervous tissue that forms the upper end of the *\*central nervous system* (see illustration). The average adult human brain weighs about 1400 g (approximately 2% of total body weight) and is continuous below with the spinal cord. It is invested by three connective tissue membranes, the *\*meninges*, and floats in *\*cerebrospinal fluid* within the rigid casing formed by the bones of the skull. The brain is divided into the hindbrain (rhombencephalon), consisting of the *\*medulla oblongata*, *\*pons*, and *\*cerebellum*; the *\*midbrain* (mesencephalon); and the forebrain (prosencephalon), subdivided into the *\*cerebrum* and the *\*diencephalon* (including the *\*thalamus* and *\*hypothalamus*). The brain is usually considered to be the site of the working of the mind, but to what extent the concepts of ‘brain’ and ‘mind’ are interchangeable is a matter of debate and of concern to anyone facing brain surgery. Anatomical name: **encephalon**.

**The brain (midsagittal section).**

**brain death** *see* DEATH.

**brain natriuretic peptide (BNP)** *see* NATRIURETIC PEPTIDE.

**brainstem** *n.* the enlarged extension upwards within the skull of the spinal cord, consisting of the medulla oblongata, the pons, and the midbrain. The pons and medulla are together known as the **bulb**, or **bulbar area**. Attached to the midbrain are the two cerebral hemispheres. *See* BRAIN.

**brainstem evoked response audiometry** *see* AUDITORY BRAINSTEM RESPONSE AUDIOMETRY.

**brain tumour** *see* CEREBRAL TUMOUR.

**branchial arch** *see* PHARYNGEAL ARCH.

**branchial cleft** *see* PHARYNGEAL CLEFT.

**branchial cyst** a cyst that arises at the site of an embryonic \*pharyngeal pouch and is due to a developmental anomaly.

**branchial pouch** *see* PHARYNGEAL POUCH.

**Brandt–Andrews method** a technique for expelling the placenta from the uterus. Upward pressure is applied to the uterus through the abdominal wall while holding the umbilical cord taut. When the uterus is elevated in this way, the placenta will be in the cervix or upper vagina and is then expelled by applying pressure below the base of the uterus. [T. Brandt (1819–95), Swedish obstetrician; H. R. Andrews (1872–1942), British gynaecologist]

**Brandt–Daroff exercises** a sequence of exercises used in the treatment of \*benign paroxysmal positional vertigo. Patients are taught how to perform the exercises and then continue the programme at home.

**Braxton Hicks contractions** irregular painless contractions of the uterus that occur during pregnancy and may become stronger towards term. [J. Braxton Hicks (1825–97), British obstetrician]

**BRCA1 and BRCA2** genes associated with susceptibility to breast and ovarian cancer. Women with mutations in either of these genes have a 56–85% risk of developing breast cancer, and this form of the cancer tends to

develop at a relatively young age. The risk of ovarian cancer is 36–66% in women with *BRCA1* mutations and 10–20% with *BRCA2*. Targeted therapy specific to these mutations using a **\*PARP inhibitor** is undergoing investigation.

**breakbone fever** *see* **DENGUE**.

**breast** *n.* **1.** the mammary gland of a woman: one of two compound glands that produce milk. Each breast consists of glandular lobules – the milk-secreting areas – embedded in fatty tissue (see illustration). The milk passes from the lobules into ducts, which join up to form 15–20 **lactiferous ducts**. Near the front of the breast the lactiferous ducts are dilated into **ampullae**, which act as reservoirs for the milk. Each lactiferous duct discharges through a separate orifice in the nipple. The dark area around the nipple is called the **areola**. *See also* **LACTATION**. Anatomical name: **mamma**. **2.** the front part of the chest (thorax).

**Breast (longitudinal section).**

**breastbone** *n.* *see* **STERNUM**.

**breast cancer** a malignant tumour of the breast, usually a **\*carcinoma**, rarely a **\*sarcoma**. It is unusual in men but is the most common form of cancer in

women, in some cases involving both breasts. Cumulative exposure to higher oestrogen levels is implicated as a causal factor: breast cancer is most strongly associated with early menarche and late menopause, childlessness, and late age at the birth of the first child, and hence with an increase in the total number of menstrual cycles in a woman's life. Approximately 5% of cases are due to the *\*BRCA1* and *BRCA2* gene mutations.

The classic sign is a lump in the breast, usually painless; bleeding or discharge from the nipple may occur infrequently. Sometimes the first thing to be noticed is a lump in the axilla (armpit), which is caused by spread of the cancer to the drainage lymph nodes. The tumour may also spread to the bones, lungs, and liver. Current treatment of a localized tumour is usually by surgery (see *LUMPECTOMY*; *MASTECTOMY*), with or without radiotherapy; cytotoxic drugs and hormone therapy are used as *\*adjuvant therapy* and *\*neoadjuvant chemotherapy* and for widespread (metastatic) disease. Anti-oestrogenic agents used include *\*tamoxifen* and (more recently) *\*aromatase inhibitors* and *\*trastuzumab* (Herceptin).

<https://www.breastcancercare.org.uk/>

- Website of Breast Cancer Care: information on signs and symptoms, diagnosis, and treatment

**breast implant** a prosthesis to replace breast tissue that has been removed surgically during a simple *\*mastectomy* in the treatment of breast cancer. The type of implant in current use is a silicone sac filled with silicone gel; it has recently been found that coating the sac with polyurethane to give a textured surface reduces the incidence of fibrosis around the implant and consequent hardening of breast tissue. Alternatively, an implant with a soya-oil filling may be used. The implant is inserted subcutaneously at the time of operation (the skin and nipple are retained), and follow-up radiotherapy is not normally required. Implants are also used to augment existing breast tissue.

**breast-milk jaundice** prolonged jaundice lasting several weeks after birth in breast-fed babies for which no other cause can be found. It improves with time and is not an indication to stop breast-feeding.

**breath-holding attacks** episodes in which a child (usually aged between one and five) cries, holds its breath, and goes blue. Such attacks are usually

precipitated by temper and may cause loss of consciousness. Drug treatment is not necessary and the attacks cease spontaneously.

**breathing** *n.* the alternation of active **inhalation** (or **inspiration**) of air into the lungs through the mouth or nose with the passive **exhalation** (or **expiration**) of the air. During inhalation the **\*diaphragm** and **\*intercostal muscles** contract, which enlarges the chest cavity and draws air into the lungs. Relaxation of these muscles forces air out of the lungs at exhalation. (See illustration.) Breathing is part of **\*respiration** and is sometimes called external respiration. There are many types of breathing in which the rhythm, rate, or character is abnormal. *See also* **APNOEA**; **BRONCHOSPASM**; **CHEYNE–STOKES RESPIRATION**; **DYSPNOEA**; **STRIDOR**.

**Breathing.** Position of the diaphragm (from the side) during breathing.

**breathlessness** *n.* *see* **DYSPNOEA**.

**breath sounds** the sounds heard through a stethoscope placed over the lungs during breathing. Normal breath sounds are soft and called **vesicular** – they may be increased or decreased in disease states. The sounds heard over the larger bronchi are louder and harsher. Breath sounds transmitted through consolidated lungs in pneumonia are louder and harsher; they are similar to the sounds heard normally over the larger bronchi and are termed **bronchial**.

**breath sounds.** \*Crepitations and \*rhonchi are sounds added to the breath sounds in abnormal states of the lung. **Amphoric** or **cavernous** sounds have a hollow quality and are heard over cavities in the lung; the amphoric quality may also be heard in voice sounds and on percussion.

**breech presentation** the position of a baby in the uterus such that it will be delivered buttocks first (instead of the normal head-first delivery). This type of delivery increases the risk of damage to the baby. *See also* **BURNS-MARSHALL MANOEUVRE**; **CEPHALIC VERSION**; **LØVSET'S MANOEUVRE**; **MAURICEAU-SMELLIE-VIET MANOEUVRE**.

**bregma** *n.* the point on the top of the skull at which the coronal and sagittal \*sutures meet. In a young infant this is an opening, the anterior \*fontanelle.

**brentuximab vedotin** a monoclonal antibody–drug conjugate used in the treatment of relapsed or refractory Hodgkin's disease and anaplastic large-cell lymphoma.

**Breslow thickness** the distance (in millimetres) between the surface and the deepest extent of a malignant \*melanoma. The measurement is the best prognostic indicator in melanoma; tumours that are less than 0.76 mm thick have a 5-year survival in well over 90% of patients. [A. Breslow (1928–80), US pathologist]

**bridge** *n.* (in dentistry) a fixed replacement for missing teeth. The artificial tooth is attached to one or more natural teeth, usually by a crown. Bridges may also be fitted on dental \*implants. The supporting teeth (or implants) are referred to as **abutments**, and the artificial teeth that fit over them are referred to as **retainers**. The replacements of missing teeth are known as **pontics**. **Adhesive bridges** are attached to one or more adjacent teeth by a metal plate that adheres to the enamel on the tooth surface prepared by the \*acid-etch technique; these bridges require minimal tooth preparation compared with conventional types of bridges.

**brief resolved unexplained episode (BRUE)** a sudden, brief (less than 30 to 60 seconds), and resolved episode in an infant that includes one or more of the following: decreased or irregular breathing; change in muscle tone; pallor or cyanosis or altered responsiveness. The episode is frightening for the person caring for the infant. BRUE is a description rather than a diagnosis

and the term is used only when there is no explanation for the event after a thorough history and examination.

**Bright's disease** *see* NEPHRITIS. [R. Bright (1789–1858), British physician]

**brimonidine** *n.* an alpha agonist (*see* SYMPATHOMIMETIC) used in the form of eye drops in the treatment of \*glaucoma and ocular hypertension. The drug reduces the production of aqueous humour and increases its outflow from the eye; it may be used when beta-blocker eye drops are medically undesirable or are ineffective in controlling the glaucoma.

**brinzolamide** *n.* a \*carbonic anhydrase inhibitor used to reduce intraocular pressure in the treatment of \*glaucoma when beta blockers are not effective or appropriate: it decreases the production of aqueous humour. It may cause local irritation and taste disturbance.

**British Medical Association (BMA)** a professional body for doctors and also an independent trade union dedicated to protecting individual members and the collective interests of doctors. It has a complex structure that allows representation both by geographical area of work and through various committees, including the General Practice Committee (GPC), Central Consultants and Specialists Committee, Junior Doctors Committee, and the Medical Students Committee.

<https://www.bma.org.uk/>

- Website of the BMA

**British National Formulary (BNF)** a reference source published by the Royal Pharmaceutical Society of Great Britain and the British Medical Journal (BMJ) Group twice a year (in March and September). It contains comprehensive information on medications from various sources, including the manufacturer as well as regulatory and professional bodies, resulting in information that is relevant to practice and takes into account national guidelines.

**British Sign Language (BSL)** *see* SIGN LANGUAGE.

**British thermal unit** a unit of heat equal to the quantity of heat required to raise the temperature of 1 pound of water by 1° Fahrenheit. 1 British thermal unit = 1055 joules. Abbrev.: Btu.

**brittle bone disease** *see* **OSTEOGENESIS IMPERFECTA**.

**brittle diabetes** type 1 **\*diabetes mellitus** that constantly causes disruption of lifestyle due to recurrent attacks of hypo- or hyperglycaemia from whatever cause. The most common reasons are therapeutic errors, emotional disorders, intercurrent illnesses, and self- or carer-induced episodes.

**BRM** *see* **BIOLOGICAL RESPONSE MODIFIER**.

**Broca's area** the area of cerebral motor cortex responsible for the initiation and control of speech. It is situated in the left frontal lobe in most (but not all) right-handed people, in the region of **\*Brodmann areas** 44 and 45. [P. P. Broca (1824–80), French surgeon]

**Brodie's abscess** a chronic abscess of bone that develops from acute bacterial **\*osteomyelitis**. The classic appearance on X-ray is a small walled-off cavity in the bone with little or no periosteal reaction. Treatment is by surgical drainage and antibiotics. [Sir B. C. Brodie (1783–1862), British surgeon]

**Brodmann areas** the numbered areas (1–47) into which a map of the **\*cerebral cortex** may conveniently be divided for descriptive purposes, based upon the arrangement of neurons seen in stained sections under the microscope. On the map area 4, for example, corresponds to primary motor cortex, while the primary visual cortex comes into area 17. [K. Brodmann (1868–1918), German neurologist]

**bromism** *n.* a group of symptoms caused by excessive intake of bromides, formerly widely used as sedatives. Overuse for long periods leads to mental dullness, weakness, drowsiness, loss of sensation, slurred speech, and sometimes coma. A form of acne may also develop.

**bromocriptine** *n.* a **\*dopamine** receptor agonist, derived from ergot, that is used in the treatment of disorders associated with excessive secretion of **\*prolactin** (such as **\*prolactinoma** and galactorrhoea), since it inhibits the secretion of this hormone by the pituitary gland. It may also be used to treat

**\*acromegaly**, as it suppresses the release of growth hormone, and – rarely – parkinsonism. Side-effects may include nausea, constipation, drowsiness, and dizziness, and there is a risk of **\*fibrosis**.

**Brompton cocktail** a mixture of alcohol, morphine, and cocaine sometimes given to control severe pain in terminally ill people, especially those dying of cancer. The mixture was first tried at the Brompton Hospital, London.

**bromsulphthalein** *n.* a blue dye used in tests of liver function. A small quantity of the dye is injected into the bloodstream, and its concentration in the blood is measured after 5 and then 45 minutes. The presence of more than 10% of the dose in the circulation after 45 minutes indicates that the liver is not functioning normally.

**bronch-** (**broncho-**) *combining form denoting the bronchial tree.* Examples: **bronchoalveolar** (relating to the bronchi and alveoli); **bronchopulmonary** (relating to the bronchi and lungs).

**bronchial carcinoma** cancer of the bronchus, one of the commonest causes of death in smokers. *See also* **LUNG CANCER**; **SMALL-CELL LUNG CANCER**.

**bronchial tree** a branching system of tubes conducting air from the trachea (windpipe) to the lungs: includes the bronchi (*see* **BRONCHUS**) and their subdivisions and the **\*bronchioles**.

**bronchiectasis** *n.* widening of the bronchi or their branches. It may be congenital or it may result from infection (especially whooping cough or measles in childhood) or from obstruction, either by an inhaled foreign body or by a growth (including cancer). Pus may form in the widened bronchus so that the patient coughs up purulent sputum, which may contain blood. Diagnosis is on the clinical symptoms and by X-ray and CT scan. Treatment consists of antibiotic drugs to control the infection and physiotherapy to drain the sputum. Surgery may be used if only a few segments of the bronchi are affected.

**bronchiole** *n.* a subdivision of the bronchial tree that does not contain cartilage or mucous glands in its wall. Bronchioles open from the fifth or sixth generation of bronchi and extend for up to 20 more generations before reaching the **terminal bronchioles**. Each terminal bronchiole divides into a

number of **respiratory bronchioles**, from which the *\*alveoli* open. Each terminal bronchiole conducts air to an acinus in the *\*lung*. —**bronchiolar** *adj.*

**bronchiolitis** *n.* inflammation of the small airways in the lungs (the *\*bronchioles*) due to viral infection, usually the *\*respiratory syncytial virus*. Bronchiolitis occurs in epidemics and is commonest in infants of less than one year. The bronchioles become swollen, the lining cells die, and the tubes become blocked with debris and mucus. This prevents air reaching the alveoli and the child becomes short of oxygen (hypoxic) and breathless. In mild cases no treatment is necessary; more severe cases require supportive treatment – administration of oxygen and feeding via a nasogastric tube. Antibiotics are indicated only if there is evidence of a secondary infection. If the child is particularly vulnerable, specific treatment with *\*ribavirin* or artificial ventilation may be beneficial. Recurrent attacks of bronchiolitis may herald the onset of *\*asthma*.

**bronchiolitis obliterans organizing pneumonia (BOOP)** a disease entity characterized clinically by a flulike illness with cough, fever, shortness of breath, and late inspiratory crackles; there are specific histological features and patchy infiltrates on X-ray. It is sometimes the result of a viral infection, but may follow medication with certain drugs or be associated with connective-tissue disease, such as rheumatoid arthritis. The condition usually responds to oral corticosteroids; however, if a drug is implicated, it must be withdrawn.

**bronchitis** *n.* inflammation of the bronchi (*see* **BRONCHUS**). **Acute bronchitis** is caused by viruses or bacteria and is characterized by coughing, the production of mucopurulent sputum, and narrowing of the bronchi due to spasmodic contraction (*see* **BRONCHOSPASM**). In **chronic bronchitis** the patient coughs up excessive mucus secreted by enlarged bronchial mucous glands on most days for at least three consecutive months in at least two consecutive years; the bronchospasm cannot always be relieved by bronchodilator drugs. It is not primarily an inflammatory condition, although it is frequently complicated by acute infections. The disease is particularly prevalent in Britain in association with cigarette smoking, air pollution, and *\*emphysema*. The combination of chronic bronchitis and emphysema is often referred to as *\*chronic obstructive pulmonary disease* (COPD).

**bronchoalveolar lavage (BAL)** a method of obtaining cellular material from the lungs that is used particularly in the investigation and monitoring of interstitial lung disease and in the investigation of pulmonary infiltrates in immunosuppressed patients. A saline solution is infused into the lung, via a bronchoscope, and immediately removed. Examination of the cells in the lavage fluid may help to identify the cause of interstitial lung disease. The combination of cytological and microbiological examination can lead to a very high rate of diagnostic accuracy in such conditions as *\*Pneumocystis jiroveci* pneumonia.

**bronchoconstrictor** *n.* a drug that causes narrowing of the air passages by producing spasm of bronchial smooth muscle.

**bronchodilator** *n.* an agent that causes widening of the air passages by relaxing bronchial smooth muscle. *\*Sympathomimetic* drugs that stimulate  $\beta_2$  adrenoceptors, such as *\*formoterol*, *\*salbutamol*, and *\*terbutaline*, are potent bronchodilators and are used for relief of bronchial asthma and chronic obstructive pulmonary disease. These drugs are often administered as aerosols, giving rapid relief, but at high doses they may stimulate the heart. Some antimuscarinic drugs (e.g. *\*ipratropium* and *\*theophylline*) are also used as bronchodilators.

**bronchography** *n.* X-ray examination of the bronchial tree after it has been made visible by the injection of *\*radiopaque* dye or contrast medium. It was used particularly in the diagnosis of *\*bronchiectasis*, but has now been largely superseded by CT scanning.

**bronchophony** *n.* *see* VOCAL RESONANCE.

**bronchopneumonia** *n.* *see* PNEUMONIA.

**bronchopulmonary dysplasia** a condition, seen usually in premature babies as a result of *\*respiratory distress syndrome*, requiring prolonged treatment with oxygen beyond the age of 28 days. The babies have overexpanded lungs, which on X-rays show characteristic changes. Management consists of oxygen support and treating infections. Recovery is slow, sometimes over several years, but most babies do recover.

**bronchoscope** *n.* an instrument used to look into the trachea and bronchi. In addition to the rigid tubular metal type, used for many years, there is now a

narrower flexible *\*fiberoptic* instrument with which previously inaccessible bronchi can be inspected. With either instrument the bronchial tree can be washed out (see **BRONCHOALVEOLAR LAVAGE**) and samples of tissue and foreign bodies can be removed with long forceps. —**bronchoscopy** *n.*

**bronchospasm** *n.* narrowing of bronchi by muscular contraction in response to some stimulus, as in *\*asthma* and *\*bronchitis*. The patient can usually inhale air into the lungs, but exhalation may require visible muscular effort and is accompanied by expiratory noises that are clearly audible (see **WHEEZE**) or detectable with a stethoscope. The condition in which bronchospasm can usually be relieved by bronchodilator drugs is known as **reversible obstructive airways disease** and includes asthma; that in which bronchodilator drugs usually have no effect is **irreversible obstructive airways disease** and includes chronic bronchitis.

**bronchus** *n.* (*pl.* **bronchi**) any of the air passages beyond the *\*trachea* (windpipe) that has cartilage and mucous glands in its wall (see illustration). The trachea divides into two main bronchi, which divide successively into five **lobar bronchi**, 20 **segmental bronchi**, and two or three more divisions. See also **BRONCHIOLE**. —**bronchial** *adj.*

**Bronchus.** The bronchi and their principal (lobar) branches.

**bronze diabetes** see **HAEMOCHROMATOSIS**.

**brown fat** a form of fat in adipose tissue that is a rich source of energy and can be converted rapidly to heat. It accounts for 5% of body weight in human infants; adults have little or no brown fat. The main form of adipose tissue in adults, **white fat** (accounting for 20–25% body weight), stores energy; infants have little or no white fat. Some forms of obesity may be linked to lack of – or inability to synthesize – brown fat.

**Brown-Séquard syndrome** the neurological condition resulting when the spinal cord has been damaged. In those parts of the body supplied by the damaged segment there is a flaccid weakness and loss of feeling in the skin. Below the lesion there is a spastic paralysis on the same side and a loss of pain and temperature sensation on the opposite side. The causes include trauma and multiple sclerosis. [C. E. Brown-Séquard (1818–94), French physiologist]

**Brown's syndrome** a condition, usually congenital, in which the tendon sheath of the superior oblique muscle of the *\*eye* does not relax, thus limiting the elevation of the eye, especially in adduction. [H. W. Brown (20th century), US ophthalmologist]

**Brucella** *n.* a genus of Gram-negative aerobic spherical or rodlike parasitic bacteria responsible for *\*brucellosis* (undulant fever) in humans and contagious abortion in cattle, pigs, sheep, and goats. The principal species are *B. abortus* and *B. melitensis*. **Brucella ring test** is a diagnostic test for brucellosis involving the clumping together of a standard *Brucella* strain by antibodies in an infected person's serum.

**brucellosis (Malta fever, Mediterranean fever, undulant fever)** *n.* a chronic disease of farm animals caused by bacteria of the genus *\*Brucella*, which can be transmitted to humans either by contact with an infected animal or by drinking nonpasteurized contaminated milk. Symptoms include headache, fever, aches and pains, sickness, loss of appetite, and weakness; occasionally a chronic form develops, with recurrent symptoms. Untreated the disease may last for years but prolonged administration of tetracycline antibiotics or streptomycin is effective.

**Bruch's membrane** the transparent innermost layer of the *\*choroid*, which is in contact with the retinal pigment epithelium (*see* **RETINA**). [K. W. L. Bruch (1819–84), German anatomist]

**Brudzinski sign** a sign present when there is irritation of the meninges (the membranes covering the brain); it is present in meningitis. As the neck is pulled forward, the hips and knees bend involuntarily. [J. von Brudzinski (1874–1917), Polish physician]

**BRUE** *see* **BRIEF RESOLVED UNEXPLAINED EPISODE**.

**Brufen** *n. see* **IBUPROFEN**.

**Brugia** *n.* a genus of threadlike parasitic worms (*see* **FILARIA**). *B. malayi* infects humans throughout southeast Asia, causing **\*filariasis** and **\*elephantiasis** (especially of the feet and legs). *B. pahangi*, a parasite of wild cats and domestic animals, produces an allergic condition in humans, with coughing, breathing difficulty, and an increase in the number of **\*eosinophils** in the blood. *Brugia* undergoes part of its development in mosquitoes of the genera *Anopheles* and *Mansonia*, which transmit the parasite from host to host.

**bruise (contusion)** *n.* an area of skin discoloration caused by the escape of blood from ruptured underlying vessels following injury. Initially red or pink, a bruise gradually becomes bluish, and then greenish yellow, as the haemoglobin in the tissues breaks down chemically and is absorbed. It may be necessary to draw off blood from very severe bruises through a needle, to aid healing. A bruise may be the sign of previous assault, detected on clinical examination or at **\*autopsy**. In a child it may be the only (and vital) evidence of **\*child abuse**. *See also* **BURN**.

**bruit** *n.* a sharp or harsh systolic sound, heard on **\*auscultation**, that is due to turbulent blood flow in a peripheral artery, usually the carotid or iliofemoral artery. Bruits can also be heard over arteriovenous **\*fistulae** or malformations.

**Brunner's glands** compound glands of the small intestine, found in the **\*duodenum** and the upper part of the jejunum. They are embedded in the submucosa and secrete mucus. [J. C. Brunner (1856–1927), Swiss anatomist]

**brush border** *see* **MICROVILLUS**.

**Brushfield spots** greyish-brown spots seen in the iris of the eye. They can be found in normal individuals but are usually associated with **\*Down's**

**syndrome.** [T. Brushfield (1858–1937), British physician]

**bruxism** *n.* a habit involving excessive jaw clenching and/or teeth grinding. It does not always cause symptoms but may lead to excessive tooth wear. Bruxism usually occurs during sleep and is often related to stress or anxiety.

**B-scan** examination of the tissues of the eye in cross section by means of a high-frequency ultrasound machine. It is useful in the diagnosis of eye disease, especially in the posterior segment of the eye when direct viewing is obscured (e.g. by dense cataracts). *See also* **A-SCAN**.

**BSE** bovine *\*spongiform encephalopathy*. *See also* **CREUTZFELDT–JAKOB DISEASE**.

**BSER** brainstem evoked response audiometry. *See* **AUDITORY BRAINSTEM RESPONSE AUDIOMETRY**.

**BSS** *see* **BALANCED SALT SOLUTION**.

**bubo** *n.* a swollen inflamed lymph node in the armpit or groin, commonly developing in some sexually transmitted diseases (e.g. soft sore), bubonic plague, and leishmaniasis.

**bubonic plague** *see* **PLAGUE**.

**buccal** *adj.* **1.** relating to the mouth or the hollow part of the cheek. **2.** describing the surface of a tooth adjacent to the cheek.

**buccal cavity** the cavity of the mouth, which contains the tongue and teeth and leads to the pharynx. Here food is tasted, chewed, and mixed with saliva, which begins the process of digestion.

**buccal glands** small glands in the mucous membrane lining the mouth. They secrete material that mixes with saliva.

**buccinator** *n.* a muscle of the cheek that has its origin in the maxilla and mandible (jaw bones). It is responsible for compressing the cheek and is important in mastication.

**buclizine** *n.* an *\*antihistamine* with marked sedative properties. It is used to treat migraine; side-effects include drowsiness.

**Budd–Chiari syndrome** a rare condition that follows occlusion of the hepatic veins by thrombosis or nonthrombotic processes. In the majority of cases the cause is unknown but hypercoagulable states, local or disseminated malignancy, and infection are possible causes. It is characterized by abdominal pain, abdominal distension due to ascites, and jaundice. Clinical examination may reveal hepatomegaly, and *\*hepatic encephalopathy*. [G. Budd (1808–82), British physician; H. Chiari (1851–1916), German pathologist]

**budesonide** *n.* a *\*corticosteroid* drug used in a nasal spray to treat hay fever or as an inhalant for asthma (for which it may be combined with *\*formoterol*). It is also administered by mouth or enema for the treatment of Crohn’s disease and ulcerative colitis.

**Buerger’s disease** an inflammatory condition of the arteries, especially in the legs, that predominantly affects young male cigarette smokers. Intermittent *\*claudication* (pain due to reduced blood supply) and gangrene of the limbs may develop. Coronary thrombosis may occur and venous thrombosis is common. The treatment is similar to that of *\*atheroma* but cessation of smoking is essential to prevent progression of the disease. Medical name: **thromboangiitis obliterans**. [L. Buerger (1879–1943), US physician]

**buffalo hump** excessive subcutaneous adipose tissue forming a hump on the back over the lower cervical (neck) and upper thoracic regions of the spine. It is seen classically in *\*Cushing’s syndrome* but also in patients who are obese. *Compare* DOWAGER’S HUMP.

**buffer** *n.* a solution whose hydrogen ion concentration (pH) remains virtually unchanged by dilution or by the addition of acid or alkali. The chief buffer of the blood and extracellular body fluids is the bicarbonate ( $\text{H}_2\text{CO}_3/\text{HCO}_3^-$ ) system. *See also* ACID-BASE BALANCE.

**bulb** *n.* (in anatomy) any rounded structure or a rounded expansion at the end of an organ or part.

**bulbar** *adj.* **1.** relating to or affecting the medulla oblongata. **2.** relating to a bulb. **3.** relating to the eyeball.

**bulbourethral glands** *see* COWPER’S GLANDS.

**bulimia** *n.* insatiable overeating. This symptom may be psychogenic, occurring, for example, as a phase of *\*anorexia nervosa* (**bulimia nervosa** or the **binge–purge syndrome**); or it may be due to neurological causes, such as a lesion of the *\*hypothalamus*.

**bull** *n.* (*pl.* **bullae**) **1.** a large blister, containing serous fluid. **2.** (in anatomy) a rounded bony prominence. **3.** a thin-walled air-filled space within the lung, arising congenitally or in *\*emphysema*. It may cause trouble by rupturing into the pleural space (*see* **PNEUMOTHORAX**), by adding to the air that does not contribute to gas exchange, and/or by compressing the surrounding lung and making it inefficient. —**bullous** *adj.*

**bullous keratopathy** a pathological condition of the cornea of the eye due to failure in the functioning of its endothelium. It results in corneal oedema, seen as small blisters in the cornea that cause blurring of vision. *See* **FUCHS' ENDOTHELIAL DYSTROPHY**.

**bullous pemphigoid** *see* **PEMPHIGOID**.

**bull's-eye maculopathy** *see* **MACULOPATHY**.

**bumetanide** *n.* a quick-acting loop *\*diuretic* used to relieve the fluid retention (oedema) occurring in heart failure, kidney disease, or cirrhosis of the liver. A possible side-effect is dizziness.

**BUN** blood urea nitrogen: a measurement of nitrogen in the form of urea in the blood, usually reported as mg/dl, in common usage in the USA (each molecule of urea has two nitrogen atoms, each of molar mass 14 g/mol). Elsewhere, the concentration of urea in the serum is reported as mmol/L:

$$\text{serum urea (in mmol / L)} = \text{BUN (in mg / dl of nitrogen)} / 2.8$$

BUN or serum urea is used as a measure of kidney function but is less precise than the serum creatinine or estimates of glomerular filtration rate based on the serum creatinine (*see* **EGFR**). A disproportionate rise in blood urea nitrogen (or serum urea) compared with creatinine may be seen with volume depletion, cardiac failure, high protein diets, gastrointestinal bleeding, loss of muscle (the classic example is the bilateral amputee), and catabolic states associated with severe burns and fevers.

**bundle** *n.* a group of muscle or nerve fibres situated close together and running in the same direction; e.g. the **\*atrioventricular bundle**.

**bundle branch block** a defect in the specialized conducting tissue of the heart (*see* **ARRHYTHMIA**) that is identified on an **\*electrocardiogram**. Right bundle branch block is a normal variant in children and young adults, but may reflect chronic lung disease or ischaemic heart disease in older adults. Left bundle branch block may occur with ischaemic heart disease, hypertension, or cardiomyopathy.

**bundle of His** *see* **ATRIOVENTRICULAR BUNDLE**. [W. His (1863–1934), Swiss anatomist]

**bunion** *n.* an area of thickened tissue overlying the metatarsal phalangeal joint at the base of the big toe. It arises when a protective **\*bursa** develops around the joint in response to friction and pressure from ill-fitting footwear. The condition is most commonly associated with **\*hallux valgus**. Treatment may range from modified footwear to surgery.

**buphthalmos (hydrophthalmos)** *n.* infantile or congenital glaucoma: increased pressure within the eye due to a defect in the development of the tissues through which fluid drains from the eye (the **\*trabecular meshwork**). Since the outer coat (sclera) of the eyeball of children is distensible, the eye enlarges as the inflow of fluid continues. It usually affects both eyes and may accompany congenital abnormalities in other parts of the body. Treatment is by surgical operation, e.g. **\*goniotomy**, to improve drainage of fluid from the eye. Spontaneous arrest of buphthalmos may occur before vision is completely lost.

**bupivacaine** *n.* a potent local anaesthetic used for regional **\*nerve block**, including **\*epidural** anaesthesia during labour and to relieve postoperative pain. It is significantly longer acting than many other local anaesthetics.

**buprenorphine** *n.* a powerful opioid analgesic (*see* **OPIATE**) used for the relief of moderate to severe pain and to treat opioid dependence. Side-effects include drowsiness, nausea and vomiting, and constipation.

**bupropion (amfebutamone)** *n.* a drug used to help people stop smoking. Side-effects include insomnia, headaches, dizziness, depression, and rashes.

Bupropion should not be taken by those with a history of epilepsy or eating disorders.

**bur** *n.* **1.** a cutting instrument that fits in a dental handpiece (*see* **DRILL**). It may be made from hardened steel, stainless steel, or tungsten carbide or be coated with diamond particles. Burs are mainly used for cutting cavities in teeth, removing old restorations, and preparing teeth to receive artificial crowns. **2. (burr)** a surgical drill for cutting through bone or other tissue.

**burden of treatment** the extra work or worry imposed on a patient by a treatment regime. This might include e.g. arranging and attending hospital appointments, collecting and managing medication, learning about a condition, and making lifestyle changes. For those with chronic conditions, these tasks can impose a significant toll on energy and wellbeing as well as disrupting their family and working life.

**bur hole (burr hole)** a circular hole drilled through the skull to release intracranial pressure (due to blood, pus, or cerebrospinal fluid) or to facilitate such procedures as needle aspiration or biopsy.

**buried bumper syndrome** a condition in which feeding via a PEG tube (*see* **GASTROSTOMY**) is blocked. It occurs when the internal retention disc (bumper) of the tube, which holds it in place inside the stomach, is overgrown by hypertrophic gastric mucosa and becomes embedded in the stomach wall. This serious complication requires surgical removal of the tube. It can be prevented by correct tube care: advancing, retracting, and rotating of the tube.

**Burkitt's lymphoma** a malignant tumour of the lymphatic system, most commonly affecting children and largely confined to tropical Africa in a zone 15° north and south of the equator. It is the most rapidly growing malignancy, with a tumour doubling time of about five days. It can arise at various sites, most commonly the facial structures, such as the jaw, and in the abdomen. The **\*Epstein-Barr virus** plays a role in the origin and growth of the tumour. Complications affecting the nervous system occur in up to 50% of cases. Non-African Burkitt's lymphoma is increasingly being recognized. All forms are very sensitive to cytotoxic drug therapy but cure is uncommon. [D. P. Burkitt (1911–93), Irish surgeon]

**burn** *n.* tissue damage caused by such agents as heat, cold, chemicals, electricity, ultraviolet light, or nuclear radiation. A **first-degree burn** affects only the outer layer (epidermis) of the skin. In a **second-degree burn** both the epidermis and the underlying dermis are damaged. A **third-degree burn** involves damage or destruction of the skin to its full depth and damage to the tissues beneath. Burns cause swelling and blistering, due to loss of plasma from damaged blood vessels. In serious burns, affecting 15% or more of the body surface in adults (10% or more in children), this loss of plasma results in severe **\*shock** and requires immediate transfusion of blood or saline solution. Burns may also lead to bacterial infection, which can be prevented by administration of antibiotics. Third-degree burns may require skin grafting. Small burns, or scars of previous burns, may be vital evidence of **\*child abuse**.

**burning mouth syndrome (BMS)** a disorder characterized by a burning sensation in the mouth for which there is no obvious medical or dental cause. Other symptoms may include thirst, sore throat, and an unpleasant taste. BMS occurs most commonly in older females and may be related to menopause, stress, or vitamin deficiencies.

**burnout** *n.* a state of deep mental and physical exhaustion in a professional, caused by excessive and ceaseless work demands. Managers have a duty to try to prevent burnout in their staff by providing proper working conditions and making support available. Individuals likewise have a duty to seek help when they need it. A burnt-out member of staff may not be reliable in the usual way and may leave the service prematurely.

**Burns–Marshall manoeuvre** a manoeuvre used during an assisted **\*breech presentation**. The baby's legs and trunk should be allowed to hang until the nape of the neck is visible at the mother's perineum so that its weight exerts gentle downwards and backwards traction to promote flexion of the head. The fetal trunk is then swept in a wide arc over the maternal abdomen by grasping both the feet and maintaining gentle traction; the aftercoming head is slowly born in this process.

**burr** *n.* *see* **BUR**.

**burr cell (echinocyte)** a red blood cell (erythrocyte) with abnormal small thorny projections. *See* **CRENATION**.

**bursa** *n.* (*pl.* **bursae**) a small sac of fibrous tissue that is lined with **\*synovial membrane** and filled with fluid (synovia). Bursae occur where parts move over one another; they help to reduce friction. They are normally formed round joints and in places where ligaments and tendons pass over bones. However, they may be formed in other places in response to unusual pressure or friction.

**bursitis** *n.* inflammation of a **\*bursa**, resulting from repetitive slight injury, pressure, or friction or from infection or inflammatory conditions. Commonly affecting the shoulder, elbow, hip, knee, or heel, it produces pain and tenderness and sometimes restricts joint movement. Treatment of bursitis not due to infection includes rest, **\*NSAIDs**, and possibly local anaesthetic and corticosteroid injections. *See also* **HOUSEMAID'S KNEE**.

**burst abdomen (abdominal dehiscence)** spontaneous opening of a surgical wound after an abdominal operation.

**Buruli ulcer** a chronic, debilitating illness caused by *Mycrobacterium ulcerans*. It begins with a painless swelling, most often on the arm or leg, that develops into a necrotizing ulcer. The condition occurs most commonly in sub-Saharan Africa and Australia, with some 2 000 cases being reported annually. At present there is no vaccine; antibiotics are usually effective if prescribed at an early stage.

**Busacca nodule** a type of nodule seen on the anterior surface of the iris in granulomatous **\*uveitis**. [A. Busacca (20th century), Italian physician]

**buserelin** *n.* a **\*gonadorelin analogue** used for the treatment of endometriosis, to help in the management of advanced prostate cancer, and in the treatment of infertility by in vitro fertilization. Possible side-effects include hot flushes, headache, emotional upset, and loss of libido.

**buspirone** *n.* a drug used for the short-term relief of the symptoms of anxiety (*see* **ANXIOLYTIC**). Common side-effects are headache, nausea, dizziness, and nervousness.

**busulfan (busulphan)** *n.* an **\*alkylating agent** that destroys cancer cells by acting on the bone marrow.

**butobarbital (butobarbitone)** *n.* an intermediate-acting **\*barbiturate**, taken for the treatment of severe insomnia that has not responded to other drugs. Prolonged administration may lead to **\*dependence** and its use with alcohol should be avoided; overdose has serious effects (*see* **BARBITURISM**).

**butterfly rash** *see* **LUPUS ERYTHEMATOSUS**.

**buttonhole deformity** *see* **BOUTONNIÈRE DEFORMITY**.

**butyrophenone** *n.* one of a group of chemically related **\*antipsychotic** drugs that includes **\*haloperidol** and **\*benperidol**. Butyrophenones inhibit the effects of **\*dopamine** by occupying dopamine receptor sites in the body.

**bypass** *n.* a surgical procedure to divert the flow of blood or other fluid from one anatomical structure to another; a **\*shunt**. A bypass can be temporary or permanent and is commonly performed in the treatment of cardiac and gastrointestinal disorders. *See also* **CARDIOPULMONARY BYPASS**; **CORONARY ARTERY BYPASS GRAFT**.

**byssinosis** *n.* an industrial disease of the lungs caused by inhalation of dusts of cotton, flax, hemp, or sisal. The patient characteristically has chest tightness and **\*wheeze** after the weekend break, which wears off during the working week.

**CA125** *n.* a **\*tumour marker** that can be detected by a simple blood test and is particularly useful in the diagnosis of ovarian cancer and also for subsequently monitoring its response to treatment. In a patient being evaluated for a pelvic mass, a CA125 level greater than 65 is associated with malignancy in approximately 90% of cases (*see* **RISK OF MALIGNANCY INDEX**). A number of benign conditions, including endometriosis and heart failure, can also cause elevations of the CA125 level, as can cancers other than ovarian cancer, including malignancies of the endometrium, lung, breast, and gastrointestinal tract.

**CA19-9** *n.* a substance whose presence in the bloodstream can be increased in certain cancers, such as pancreatic cancers, and is increasingly used as a **\*tumour marker** in blood tests.

**cabergoline** *n.* a dopamine receptor agonist (*see* **DOPAMINE**) that is now rarely used alone, or as an adjunct to **\*levodopa** combined with benserazide or carbidopa, to treat Parkinson's disease. It has other uses and effects similar to those of **\*bromocriptine**.

**CABG** *see* **CORONARY ARTERY BYPASS GRAFT**.

**cac-** (**caco-**) *combining form denoting* disease or deformity. Example: **cacosmia** (unpleasant odour).

**cachet** *n.* a flat capsule containing a drug that has an unpleasant taste. The cachet is swallowed intact by the patient.

**cachexia** *n.* a condition of abnormally low weight, weakness, and general bodily decline associated with chronic disease. It occurs in such conditions as cancer, pulmonary tuberculosis, and malaria.

**cacosmia** *n.* a disorder of the sense of smell in which scents that are inoffensive to most people are objectionable to the sufferer or in which a bad smell seems to be perpetually present. The disorder is usually due to damage to pathways within the brain rather than in the nose or olfactory nerve.

**CAD** *see* **CORONARY ARTERY DISEASE**.

**cadmium** *n.* a silvery metallic element that can cause serious lung irritation if the fumes of the molten metal are inhaled. Long-term exposure may also cause kidney damage. Symbol: Cd.

**caecostomy** *n.* the creation of an artificial **\*stoma** that serves as a bridge between the caecum and the anterior abdominal wall. Its function is to facilitate lavage in patients with refractory constipation or to decompress the intestine, usually when the colon is obstructed or injured. This may be performed surgically or endoscopically (**percutaneous endoscopic caecostomy, PEC**).

**caecum** *n.* a blind-ended pouch at the junction of the small and large intestines, situated below the **\*ileocaecal valve**. The upper end is continuous with the colon and the lower end bears the vermiform appendix. *See* **ALIMENTARY CANAL**.

**caeruloplasmin** *n.* a copper-containing protein present in blood plasma. Congenital deficiency of caeruloplasmin leads to abnormalities of the brain and liver (*see* **WILSON'S DISEASE**).

**Caesarean section** a surgical operation for delivering a baby through the abdominal wall. The operation most commonly performed is **lower uterine segment Caesarean section (LUSCS)**, carried out through a transverse incision in the lower portion of the uterus (*see* **LOWER UTERINE SEGMENT**). **Classical Caesarean section**, in which the upper segment of the uterus is incised vertically, is now rarely performed. In addition to its use in cases of obstructed labour, **\*malpresentation** (breech, brow, and shoulder), and in severe **\*antepartum haemorrhage**, Caesarean section is being performed increasingly when the baby is at risk and is exhibiting signs of distress. Because of improved techniques in perinatal care, particularly of the preterm baby, the operation may be performed, if necessary, as soon as the child is viable.

**caesium-137** *n.* an artificial radioactive isotope of the metallic element caesium. The radiation given off by caesium-137 can be employed in the technique of **\*radiotherapy**, but is now rarely used. Symbol: Cs-137.

**café au lait spots** well-defined pale-brown **\*macules** on the skin. They are present in up to 20% of the normal population, but the presence of six or more in an individual is strongly suggestive of **\*neurofibromatosis** type 1.

**caffeine** *n.* an alkaloid drug, present in coffee and tea, that has a stimulant action, particularly on the central nervous system. It is used to promote wakefulness and increase mental activity; it also possesses diuretic properties, and large doses may cause headache. Caffeine is often included with aspirin or codeine in analgesic preparations.

**Caffey's disease** *see* **HYPEROSTOSIS**. [J. Caffey (1895–1966), US paediatrician]

**CAGE questionnaire** a screening tool for alcoholism, widely used in hospitals, primary care, and psychiatric services. The name derives from an acronym of its four questions: (1) Have you ever felt you needed to cut down on your drinking? (2) Have people annoyed you by criticizing your drinking? (3) Have you ever felt guilty about drinking? (4) Have you ever felt you needed a drink first thing in the morning (*eye-opener*) to steady your nerves or to get rid of a hangover? A CAGE test score of two or more yes answers indicates a reasonably high likelihood of alcohol problems.

**caisson disease** *see* **COMPRESSED AIR ILLNESS**.

**calamine** *n.* a preparation of zinc carbonate used as a mild astringent on the skin in the form of a lotion, cream, or ointment. It is also included in a **\*coal tar** preparation for the treatment of psoriasis.

**calc-** (**calci-**, **calco-**) *combining form denoting* calcium or calcium salts.

**calcaneus (heel bone)** *n.* the large bone in the **\*tarsus** of the foot that forms the projection of the heel behind the foot. It articulates with the cuboid bone in front and with the talus above.

**calcar** *n.* a spurlike projection. The **calcar avis** is the projection in the medial wall of the lateral ventricle of the brain.

**calcicosis** *n.* **\*pneumoconiosis** due to breathing marble dust. The term is not in current use.

**calciferol** *n.* *see* **VITAMIN D**.

**calcification** *n.* the deposition of calcium salts in tissue. This occurs as part of the normal process of bone formation (*see* **OSSIFICATION**). *Compare* **DYSTROPHIC CALCIFICATION**; **METASTATIC CALCIFICATION**.

**calcineurin inhibitors** drugs that act by inhibiting the calcium-dependent protein **\*phosphatase** calcineurin, an enzyme that initiates a sequence of events that bring about activation of T **\*lymphocytes**. The group includes **\*ciclosporin** and **\*tacrolimus**, which are major maintenance immunosuppressants used in transplantation. Topical calcineurin inhibitors (e.g. tacrolimus, **pimecrolimus** [Elidel]) are used in the treatment of eczema when topical steroids have failed or are contraindicated. Stinging is a common transient side-effect, and reactivation of infections may occur.

**calcinosis** *n.* the abnormal deposition of calcium salts in the tissues. This may occur only in the fat layer beneath the skin or it may be more widespread. *See also* **METASTATIC CALCIFICATION**.

**calciophylaxis** *n.* calcific uraemic arteriolopathy: a rare and often fatal complication of end-stage renal failure associated with small vessel calcification, intractable skin ulceration, and a high risk of septic complications.

**calcipotriol** *n.* a vitamin D analogue administered as an ointment or scalp lotion for the treatment of psoriasis. Possible side-effects include skin irritation and facial dermatitis.

**calcitonin (thyrocalcitonin)** *n.* a hormone, produced by **\*C cells** in the thyroid gland, that lowers the levels of calcium and phosphate in the blood. Medullary **\*thyroid cancer** can produce high levels of this hormone, enabling its use as a tumour marker. A recombinant form of salmon calcitonin, **salcatonin**, is given by injection or nasal spray to treat malignant hypercalcaemia and Paget's disease of the bone. *Compare* **PARATHYROID HORMONE**.

**calcitriol** *n.* 1,25-dihydroxycholecalciferol: the final and most metabolically active form of vitamin D<sub>3</sub>. It is formed in the kidney by the addition of two hydroxy (–OH) groups to the basic vitamin D molecule, which itself is produced in the skin from 7-dehydrocholesterol or ingested in certain foods. Calcitriol is given to raise blood calcium levels in patients with severe kidney disease and to treat postmenopausal osteoporosis. It is also used as an ointment to treat psoriasis.

**calcium** *n.* a metallic element essential for the normal development and functioning of the body. Calcium is an important constituent of bones and teeth: the matrix of **\*bone**, consisting principally of calcium phosphate, accounts for about 99% of the body's calcium. It is present in the blood at a concentration of about 10 mg/100 ml, being maintained at this level by hormones (*see* **CALCITONIN**; **PARATHYROID HORMONE**). It is essential for many metabolic processes, including nerve function, muscle contraction, and blood clotting.

The RNI (*see* **DIETARY REFERENCE VALUES**) for men is 700 mg/day and women 800 mg/day; the National Osteoporosis Society recommends up to 1200 mg/day for individuals with **\*osteoporosis**. The best sources are dairy products (milk and cheese); the absorption from cereals and green vegetables is limited by the presence of phytates and oxalates. Its uptake by the body is facilitated by **\*vitamin D**; a deficiency of this vitamin may result in such conditions as **\*rickets**, osteoporosis, and **\*osteomalacia**. A deficiency of calcium in the blood may lead to **\*tetany**. Excess calcium may be deposited in the body as **\*calculi** (stones). Symbol: Ca.

**calcium-channel blocker (calcium antagonist)** a drug that inhibits the influx of calcium ions into cardiac and smooth-muscle cells; it therefore reduces the strength of heart-muscle contraction, reduces conduction of impulses in the heart, and causes **\*vasodilatation**. Calcium-channel blockers, which include **\*amlodipine**, **\*diltiazem**, **\*nicardipine**, **\*nifedipine**, and **\*verapamil**, are used to treat angina and high blood pressure.

**calcium pyrophosphate deposition disease** a condition in which calcium pyrophosphate is deposited in joints. The most common manifestation is **\*pseudogout**, marked by acute pain, redness, and swelling resembling gout. Alternatively it may be asymptomatic in association with **\*chondrocalcinosis**

seen on X-ray, it may occur with osteoarthritis in the affected joint, or there may be chronic inflammation of the joint.

**calcium score** a quantification of the amount of calcium seen in the coronary arteries on a CT scan, calcium being a marker of severe coronary artery disease.

**calculosis** *n.* the presence of multiple calculi (stones) in the body. *See* CALCULUS.

**calculus** *n.* (*pl.* **calculi**) **1.** a stone: a hard pebble-like mass formed within the body, particularly in the gall bladder (*see* GALLSTONE) or anywhere in the urinary tract (*see* CYSTOLITHIASIS; NEPHROLITHIASIS; STAGHORN CALCULUS). Calculi in the urinary tract are commonly composed of calcium oxalate and are usually visible on X-ray examination. Some of these stones cause pain if they are associated with obstruction and prevent urine flow in the ureter or kidney, or by direct irritation of the bladder. Stones passing down a duct (such as the ureter) cause severe colicky pain. Most stones pass spontaneously, but some need to be broken into smaller pieces, usually by extracorporeal *\*lithotripsy*, and the remainder by endosurgical techniques (*see* LITHOLAPAXY) or rarely by open surgery. Calculi may also occur in the ducts of the salivary glands. **2.** a calcified deposit that forms on the surface of a tooth that is covered with dental *\*plaque* as a result of poor oral hygiene. **Supragingival calculus** forms above the *\*gingivae* (gums), principally in relation to the openings of the salivary gland ducts. **Subgingival calculus** forms beneath the crest of the gingivae. Calculus hinders the cleaning of teeth and its presence contributes to *\*gingivitis* and *\*periodontal disease*. A link has been demonstrated between increased calculus levels and infective *\*endocarditis*.

**Caldicott guardian** an individual appointed by an NHS trust or health authority board with overall responsibility for ensuring that the confidentiality and security of patient information is maintained.

**calibrator** *n.* **1.** an instrument used for measuring the size of a tube or opening. **2.** an instrument used for dilating a tubular part, such as the gullet.

**caliectasis (hydrocalycosis)** *n.* dilatation or distension of the calyces of the kidney, which is mainly associated with *\*hydronephrosis* and usually

demonstrated by ultrasound, intravenous urography, or computerized tomography (CT).

**calliper (caliper)** *n.* **1.** an instrument with two prongs or jaws, used for measuring diameters: used particularly in obstetrics for measuring the diameter of the pelvis. **2. (calliper splint)** a surgical appliance (*see* **ORTHOSIS**) that is used to correct or control deformity of a joint in the leg. It consists of a metal bar that is fixed to the shoe and held to the leg by means of straps.

**callosity (callus)** *n.* a hard thick area of skin occurring in parts of the body subject to pressure or friction. The soles of the feet and palms of the hands are common sites, and if much hard dead skin develops, a callosity can become painful. A **\*corn** is a type of callosity.

**callotasis** *n.* the process of stretching the callus that forms between the ends of a bone that has been divided. It is achieved by means of an external fixator attached to the bone in the procedure for **\*limb lengthening**. The elongated callus consolidates to form new bone.

**callus** *n.* **1.** the composite mass of tissue that forms between bone ends when a fracture is healing. It initially consists of blood clot and **\*granulation** tissue, which develops into cartilage and then calcifies to form bone. Callus formation is an essential part of the process of healthy union in a fractured bone. **2. see** **CALLOSITY**.

**calor** *n.* heat: one of the classical signs of inflammation in a tissue, the other three being **\*rubor** (redness), **\*dolor** (pain), and **\*tumor** (swelling). An inflamed region has a higher temperature than normal because of the distended blood vessels, which allow an increased flow of blood.

**calorie** *n.* a unit commonly defined as the approximate amount of energy required to raise the temperature of 1 gram of water by 1°C at atmospheric pressure. The energy value of foods should be expressed in **kilocalories** (one kilocalorie (kcal) is equal to 1000 calories). The SI unit is the **\*joule**: 1 calorie = 4.1855 joules. The average adult requires 1994 kcal (women) or 2250 kcal (men) per day.

**calorimeter** *n.* any apparatus used to measure the heat lost or gained during various chemical and physical changes. For example, calorimeters may be

used to determine the total energy values of different foods in terms of calories. —**calorimetry** *n.*

**calprotectin** *n.* a marker of intestinal inflammation. **Faecal calprotectin** is a noninvasive screening test that measures the quantity of calprotectin in a stool sample. If the result is strongly positive the patient should be assessed by a gastroenterologist and considered for invasive investigation. Very high levels of faecal calprotectin are seen in inflammatory bowel disease. If the patient's symptoms suggest a functional bowel disorder (such as irritable bowel syndrome) but there are no worrying (or 'red flag') symptoms and the faecal calprotectin is negative, the patient does not require a colonoscopy.

**calvaria** *n.* the vault of the \*skull.

**calyx** *n.* (*pl.* calyces) a cup-shaped part, especially any of the divisions of the pelvis of the \*kidney. Each calyx receives urine from the urine-collecting tubes in one sector of the kidney.

**Cameron's ulcer** linear \*erosion found on the lining of the stomach at or near the level of the diaphragm in patients with large hiatus \*hernias. The cause is unclear but interruption in the blood supply (\*ischaemia) is one of the likely explanations. Treatment involves \*antisecretory drugs and treatment of anaemia, which is often present.

**Campbell de Morgan spots** *see* **ANGIOMA**. [C. G. de Morgan (1811–76), British physician]

**camphor** *n.* a crystalline aromatic substance obtained from the tree *Cinnamomum camphora*. It is used in creams, liniments, and sprays as a counterirritant and antipruritic.

**camptodactyly** *n.* congenital and permanent flexion of a finger, most commonly the little finger; it can occur at one or both interphalangeal joints. It often affects both hands and is first noticed at the age of about ten; no treatment is needed.

**Campylobacter** *n.* a genus of motile Gram-negative bacteria that have a characteristic spiral or corkscrew appearance when viewed under an electron microscope. Species of *Campylobacter* are a common cause of food

poisoning, producing headache, nausea, diarrhoea, and vomiting lasting for 3–5 days. *See also* [HELICOBACTER](#).

**canaglifozin** *n.* *see* [SGLT-2 INHIBITORS](#).

**canal** *n.* a tubular channel or passage; e.g. the [\\*alimentary canal](#) and the auditory canal of the ear.

**canaliculitis** *n.* inflammation of a canaliculus, especially a lacrimal canaliculus (*see* [LACRIMAL APPARATUS](#)).

**canaliculus** *n.* (*pl.* canaliculi) a small channel or canal. Canaliculi occur, for example, in compact bone, linking lacunae containing bone cells. **Bile canaliculi** are minute channels within the liver that transport bile to the bile duct. **Lacrimal canaliculi** drain tears into the lacrimal sac (*see* [LACRIMAL APPARATUS](#)).

**canalith** *n.* a particle derived from [\\*otoliths](#) in the [\\*utricle](#) of the inner ear, displaced from its normal site and located within the canal portion of one of the semicircular canals. Canaliths are implicated in [\\*benign paroxysmal positional vertigo](#).

**cancellous** *adj.* lattice-like: applied to the porous spongy network of flattened sheets of [\\*bone](#), interconnected like a honeycomb, that forms the interior of bones and has a lower density than the surrounding cortical bone. *See also* [LAMELLAR BONE](#).

**cancer** *n.* any [\\*malignant](#) tumour, including [\\*carcinoma](#), [\\*lymphoma](#), [\\*leukaemia](#), and [\\*sarcoma](#). It arises from the abnormal, purposeless, and uncontrolled division of cells that then invade and destroy the surrounding tissues. Spread of cancer cells ([\\*metastasis](#)) may occur via the bloodstream or the lymphatic channels or across body cavities such as the pleural and peritoneal spaces (*see* [TRANSCOELOMIC SPREAD](#)), thus setting up secondary tumours (metastases) at sites distant from the original tumour. Each individual primary tumour has its own pattern of local behaviour and spread; for example, bone metastasis is very common in cancers of the breast, bronchus, thyroid, kidney, and prostate but less common in other tumours.

There are many causative factors, some of which are known; for example, cigarette smoking is associated with lung cancer, radiation with some sarcomas and leukaemia, and several viruses are implicated (*see* **ONCOGENIC**). A genetic element is implicated in the development of many cancers. In many cancers a gene called *\*p53* is deleted or impaired: its normal function is to prevent the uncontrolled division of cells (*see* **TUMOUR NECROSIS FACTOR**). Whatever the initiating cause, cancer always results ultimately from DNA mutations.

Treatment of cancer depends on the type of tumour, the site of the primary tumour, and the extent of spread. *\*Truth-telling* will be important for most cancer patients but is still hard for some clinicians.

- Website of Cancer Research UK: includes information for patients and their families

**cancer phobia** a disorder of the phobic type in which minor symptoms are interpreted as signs of cancer and panic attacks may occur. As with any other phobic disorder, cancer phobia cannot be treated by appeals to reason. Some success has been achieved by various forms of *\*behaviour therapy* and *\*SSRIs*.

**cancrum oris** *see* **NOMA**.

**candela** *n.* the *\*SI unit* of luminous intensity, equal to the intensity in a given direction of a source that emits monochromatic radiation of frequency  $540 \times 10^{12}$  Hz and has a radiant intensity in that direction of 1/683 watt per steradian. Symbol: cd.

**candesartan** *n. see* **ANGIOTENSIN II ANTAGONIST**.

**Candida** *n.* a genus of *\*yeasts* (formerly called *Monilia*) that inhabit the vagina and alimentary tract and can – under certain conditions – cause *\*candidiasis*. The species *C. albicans*, a small oval budding fungus, is primarily responsible for candidiasis.

**candidiasis (candidosis)** *n.* a common *\*yeast* infection of moist areas of the body, usually caused by *\*Candida albicans*. It is especially common in the vagina, where it is known as **thrush**, but is also found in the mouth and skin folds. On the skin, the lesions are bright red with small satellite pustules, while in the mouth candidiasis appears as white patches on the tongue or inside the cheeks. In the vagina it produces itching and sometimes a thick white discharge. Candidiasis may develop in patients receiving broad-spectrum antibiotics as well as in those who are *\*immunocompromised*. Topical, intravaginal, or oral therapy with *\*imidazoles* is effective; oral *\*nystatin* helps to reduce candidal infection of the bowel.

**candour** *n.* *see* **TRUTH-TELLING**.

**canine** *n.* the pointed tooth that is the third from the midline of each jaw, between the incisors and premolars. There are thus four canines, two in each jaw, in both the permanent and primary (deciduous) *\*dentitions*. It is known colloquially as the **eye tooth**.

**cannabis** *n.* a recreational drug prepared from the Indian hemp plant (*Cannabis sativa*), also known as **pot**, **marijuana**, **hashish**, and **bhang**. Smoked or swallowed, it produces euphoria and affects perception and awareness, particularly of time; high doses may cause hallucinations. In the UK cannabis is currently classified as a class B drug under the *\*Misuse of Drugs Act 1971* (as amended). The medical use of cannabis products for those with ‘exceptional clinical need’ was legalized in 2018; this has so far been taken to include people with epilepsy and those suffering particularly severe effects from chemotherapy. A particular extract of cannabis containing its principal psychoactive ingredient, **tetrahydrocannabinol**, had already (2010) been licensed for treating spasticity in patients with multiple sclerosis. See **Appendix 12** for a list of street names for illicit drugs.

**cannula** *n.* a hollow tube designed for insertion into a body cavity, such as the bladder, or a blood vessel. The tube contains a sharp pointed solid core (**trocar**), which facilitates its insertion and is withdrawn when the cannula is

in place. This allows aspiration of contents or infiltration of substances, such as medication.

**cantholysis** *n.* surgical division of the attachment of the **\*canthus** (corner of the eye) from its underlying bone and tendon. It is performed as part of some eye operations.

**canthoplasty** *n.* a surgical procedure to reconstruct the **\*canthus** (corner of the eye).

**canthus** *n.* either corner of the eye; the angle at which the upper and lower eyelids meet. —**canthal** *adj.*

**cap** *n.* **1.** a covering or a cover-like part. The **duodenal cap** is the superior part of the duodenum as seen on X-ray after a barium swallow and meal. **2.** (in contraception) *see* **DIAPHRAGM**.

**CAP** community-acquired **\*pneumonia**.

**capacity** *n.* the state of being able to make decisions about one's medical care, i.e. to consent to or to refuse treatment. The law, by virtue of the **\*Mental Capacity Act 2005**, requires that to assess capacity doctors should evaluate whether a patient can comprehend, retain, and weigh up information in the balance such as to make a considered decision that can be communicated. The patient must understand the nature, purpose, and possible consequences of having and not having investigations or treatments. Capacity is often impaired in such conditions as stroke, dementia, learning disability, mental illness, and intoxication with illicit substances. The term **competence** is often used as a synonym, but since the Mental Capacity Act 2005 came into force capacity is the preferred term. *See also* **INCOMPETENCE**. — **capacitous** *adj.*

**CAPD** **1.** chronic (or continuous) ambulatory **\*peritoneal dialysis**: a method of treating renal failure on an out-patient basis. **2.** central **\*auditory processing disorder**.

**capecitabine** *n.* a drug of the **\*fluoropyrimidine** class that is used in treatment of advanced or metastatic colorectal cancer, stomach cancer, and breast cancer. Side-effects may include blood disorders (*see* **MYELOSUPPRESSION**) and mouth ulcers.

**Capgras' syndrome (illusion of doubles)** the delusion that a person closely involved with the patient has been replaced by an identical-looking impostor. It is often, but not necessarily, a symptom of paranoid *\*schizophrenia*. [J. M. J. Capgras (1873–1950), French psychiatrist]

**capillary** *n.* an extremely narrow blood vessel, approximately 5–20  $\mu\text{m}$  in diameter. Capillaries form networks in most tissues; they are supplied with blood by arterioles and drained by venules. The vessel wall is only one cell thick, which enables exchange of oxygen, carbon dioxide, water, salts, etc., between the blood and the tissues (see illustrations).

**Capillary.** A network of capillaries (above); a single capillary (below).

**capillary refill time** a quickly performed test to assess the adequacy of circulation in an individual with poor cardiac output. An area of skin is pressed firmly by (say) a fingertip until it loses its colour; the number of

seconds for the area to return to its original colour indicates capillary refill time. Normal capillary refill takes around 2 seconds. Slow capillary refill may occur globally in an individual with poor circulation or in a small area (e.g. a toe) in which local circulation is compromised (due, for example, to peripheral vascular disease). This test may not be very useful in people with dark skin.

**capitate** *adj.* head-shaped; having a rounded extremity.

**capitate bone** the largest bone of the wrist (*see* **CARPUS**). It articulates with the scaphoid and lunate bones behind, with the second, third, and fourth metacarpal bones in front, and with the trapezoid and hamate laterally.

**capitellum** *n.* *see* **CAPITULUM**.

**capitulum** *n.* the small rounded end of a bone that articulates with another bone. For example, the **capitulum humeri** (or **capitellum**) is the round prominence at the elbow end of the humerus that articulates with the radius.

**capping** *n.* (in dentistry) **1.** a colloquial term for crowning: the technique of fitting a tooth with an artificial **\*crown**. **2.** *see* **PULP CAPPING**.

**capreomycin** *n.* an antibiotic, derived from the bacterium *Streptomyces capreolus*, that is used in the treatment of tuberculosis. It is given with other antituberculosis drugs to reduce the development of resistance by the infective bacteria. The more serious side-effects include ear and kidney damage.

**capsule** *n.* **1.** a membrane, sheath, or other structure that encloses a tissue or organ. For example, the kidney, adrenal gland, and lens of the eye are enclosed within capsules. A **joint capsule** is the fibrous tissue, including the synovial membrane, that surrounds a freely movable joint. **2.** a soluble case, usually made of gelatin, in which certain drugs are administered. **3.** the slimy substance that forms a protective layer around certain bacteria, hindering their ingestion by phagocytes. It is usually made of **\*polysaccharide**.

**capsule endoscopy** *see* **VIDEO CAPSULE ENDOSCOPY**.

**capsulitis** *n.* inflammation of the capsule surrounding a joint. *See also* **FROZEN SHOULDER**.

**capsulorrhexis** *n.* a continuous tear made in the lens capsule of the eye. In **anterior capsulorrhexis**, performed during cataract surgery, the tear is made in the anterior surface of the capsule. It has the advantage over a **\*capsulotomy** in making the residual capsule much more resilient to being torn during surgery.

**capsulotomy** *n.* an incision made in the capsule of the lens. In **posterior capsulotomy** a hole is made in the centre of the posterior capsule using a **\*YAG laser**, thus providing a clear path for light rays to reach the retina. The laser light is aimed using a modified slit-lamp microscope from outside the eye.

**captopril** *n.* a drug used in the treatment of heart failure, hypertension, and diabetic nephropathy; it acts by inhibiting the action of angiotensin (see **ACE INHIBITOR**). Side-effects include rash, **\*neutropenia** or **\*agranulocytosis**, hypotension, and loss of taste.

**caput succedaneum** a temporary swelling of the soft parts of the head of a newly born infant that occurs during labour, due to compression by the muscles of the cervix (neck) of the uterus, and resolves after delivery. Compare **CEPHALHAEMATOMA**; **CHIGNON**.

**carbamazepine** *n.* an **\*anticonvulsant** drug used in the treatment of epileptic tonic-clonic seizures, the prophylaxis of bipolar affective disorder, and to relieve the pain of trigeminal neuralgia. Common side-effects include drowsiness, dizziness, and muscular incoordination; abnormalities of liver and bone marrow may occur with long-term treatment.

**carbamide peroxide** a urea peroxide compound that is commonly used in tooth-whitening agents, anti-infective agents, and earwax remover.

**carbidopa** *n.* see **LEVODOPA**.

**carbimazole** *n.* a **\*thionamide** used to reduce the production of thyroid hormone in cases of overactivity of the gland (thyrotoxicosis). A prodrug, it is converted to its biologically active metabolite, **methimazole**, within the body. Gastrointestinal upsets, rashes, and itching may occur; more rarely, carbimazole may cause **\*myelosuppression**.

**carbocisteine** *n.* see **MUCOLYTIC**.

**carbohydrate** *n.* any one of a large group of compounds, including the **\*sugars** and **\*starch**, that contain carbon, hydrogen, and oxygen and have the general formula  $C_x(H_2O)_y$ . Carbohydrates are important as a source of energy: they are manufactured by plants and obtained by animals from the diet, being one of the three main constituents of food (*see also* **FAT**; **PROTEIN**). All carbohydrates are eventually broken down in the body to the simple sugar **\*glucose**, which can then take part in energy-producing metabolic processes. Excess carbohydrate, not immediately required by the body, is stored in the liver and muscles in the form of **\*glycogen**. In plants carbohydrates are important structural materials (e.g. cellulose) and storage products (commonly in the form of starch). *See also* **DISACCHARIDE**; **MONOSACCHARIDE**; **POLYSACCHARIDE**.

**carbol fuchsin** a red stain for bacteria and fungi, consisting of carbolic acid and **\*fuchsin** dissolved in alcohol and water.

**carbolic acid** *see* **PHENOL**.

**carbon dioxide** a colourless gas formed in the tissues during metabolism and carried in the blood to the lungs, where it is exhaled (an increase in the concentration of this gas in the blood stimulates respiration). Carbon dioxide occurs in small amounts in the atmosphere; it is used by plants in the process of **\*photosynthesis**. It forms a solid (dry ice) at  $-75^{\circ}\text{C}$  (at atmospheric pressure) and in this form is used as a refrigerant. Formula:  $\text{CO}_2$ .

**carbonic anhydrase inhibitor** any one of a class of drugs that act by blocking the action of the enzyme carbonic anhydrase. This enzyme greatly speeds up the reaction between carbon dioxide and water to form carbonic acid, a compound needed for the production of many of the body's secretions. Carbonic anhydrase is present in high concentrations in the eye, kidneys, stomach lining, and pancreas. Carbonic anhydrase inhibitors reduce the production of aqueous humour in the eye and are used mainly in treating **\*glaucoma**. They include **\*acetazolamide**, **\*brinzolamide**, and **\*dorzolamide**.

**carbon monoxide** a colourless almost odourless gas that is very poisonous. When breathed in it combines with haemoglobin in the red blood cells to form **\*carboxyhaemoglobin**, which is bright red in colour. This compound is chemically stable and thus the haemoglobin can no longer combine with

oxygen. Carbon monoxide is present in coal gas and motor exhaust fumes. Formula: CO.

**carbon tetrachloride** a pungent volatile fluid used as a dry-cleaner. When inhaled or swallowed it may severely damage the heart, liver, and kidneys, causing cirrhosis and nephrosis, and it can also affect the optic nerve and other nerves. Treatment is by administration of oxygen. Formula: CCl<sub>4</sub>.

**carboplatin** *n.* a derivative of platinum that is used in the treatment of advanced ovarian and lung cancers. It is similar to **\*cisplatin** but has fewer side-effects; in particular, it causes less nausea and nephrotoxicity but more myelosuppression.

**carboprost** *n.* a synthetic **\*prostaglandin** used to control severe postpartum haemorrhage that has not responded to ergometrine and oxytocin. Side-effects include nausea and vomiting, diarrhoea, and flushing.

**carboxyhaemoglobin** *n.* a substance formed when carbon monoxide combines with the pigment **\*haemoglobin** in the blood. Carboxyhaemoglobin is incapable of transporting oxygen to the tissues and this is the cause of death in carbon monoxide poisoning. Large quantities of carboxyhaemoglobin are formed in carbon monoxide poisoning, and low levels are always present in the blood of smokers and city dwellers.

**carboxylase** *n.* an enzyme that catalyses the addition of carbon dioxide to a substance.

**carbuncle** *n.* a collection of **\*boils** with multiple drainage channels. The infection is usually caused by *Staphylococcus aureus* and may result in an extensive slough of skin. Treatment is with antibiotics and sometimes also by surgery.

**carcin- (carcino-)** *combining form denoting cancer or carcinoma.* Example: **carcinogenesis** (development of).

**carcino-embryonic antigen (CEA)** a protein produced in the fetus but not in normal adult life. It may be produced by carcinomas, particularly of the colon, and is a rather insensitive marker of malignancy. It is an example of an **\*oncofetal antigen** that is used as a **\*tumour marker**, particularly in the follow-up of colorectal cancer.

**carcinogen** *n.* any substance that, when exposed to living tissue, may cause the production of cancer. Known carcinogens include ionizing radiation and many chemicals, e.g. those found in cigarette smoke and those produced in certain industries. They cause damage to the DNA of cells that may persist if the cell divides before the damage is repaired. Damaged cells may subsequently develop into a **\*cancer** (see also **CARCINOGENESIS**). An inherent susceptibility to cancer may be necessary for a carcinogen to promote the development of cancer. See also **ONCOGENIC**. —**carcinogenic** *adj.*

**carcinogenesis** *n.* the evolution of an invasive cancer cell from a normal cell. This is a multistep process characterized by successive genetic mutations caused by carcinogens. Intermediate stages, sometimes called **premalignant**, **preinvasive**, or **noninvasive**, may be recognizable, but the interchangeable use of these terms can be confusing, and they have been replaced by **\*carcinoma in situ**.

**carcinoid** *n.* a tumour of the **\*argentaffin cells** in the glands of the intestine (see **APUDOMA**). Carcinoids typically occur in the tip of the appendix and are among the commonest tumours of the small intestine. They may also occur in the rectum and other parts of the digestive tract and in the bronchial tree (**bronchial carcinoid adenoma**). Carcinoids sometimes produce 5-hydroxytryptamine (serotonin), prostaglandins, and other physiologically active substances, which are inactivated in the liver. If a gastrointestinal tumour has spread to the liver, excess amounts of these substances are released into the systemic circulation and the **carcinoid syndrome** results – flushing, headache, diarrhoea, bronchial constriction causing asthma-like attacks, and in some cases damage to the right side of the heart associated with fibrosis of the tricuspid valve. Bronchial carcinoids can give rise to the syndrome without metastasizing.

**carcinoma** *n.* **\*cancer** that arises in epithelium, the tissue that lines the skin and internal organs of the body. It may occur in any tissue containing epithelial cells. In many cases the site of origin of the tumour may be identified by the nature of the cells it contains. Organs may exhibit more than one type of carcinoma; for example, an adenocarcinoma and a squamous carcinoma may be found in the cervix (but not usually concurrently).

Treatment depends on the nature of the primary tumour, different types responding to different drug combinations. —**carcinomatous** *adj.*

**carcinoma in situ (CIS)** the earliest stage of cancer spread, in which the neoplasm is confined by the basement membrane of the epithelium. Surgical removal of the growth should lead to cure. *See also* **CERVICAL CANCER**; **CERVICAL INTRAEPITHELIAL NEOPLASIA**; **DUCTAL CARCINOMA IN SITU**.

**carcinomatosis** *n.* carcinoma that has spread widely throughout the body. Spread of the cancer cells occurs via the lymphatic channels and bloodstream and across body cavities, for example the peritoneal cavity.

**carcinosarcoma** *n.* a malignant tumour of the cervix, uterus, or vagina containing a mixture of **\*adenocarcinoma** and cells with a sarcoma appearance, previously called **malignant mixed Müllerian tumours (MMMT)**. These tumours are actually epithelial in origin and should be treated as high-grade adenocarcinomas. Sarcomatoid differentiation of epithelial cancers often indicates a poor prognosis.

**cardi- (cardio-)** *combining form denoting the heart.* Examples: **cardiomegaly** (enlargement of); **cardiopathy** (disease of).

**cardia** *n.* **1.** the opening at the upper end of the **\*stomach** that connects with the oesophagus (gullet). **2.** the heart.

**cardiac** *adj.* **1.** of, relating to, or affecting the heart. **2.** of or relating to the upper part of the stomach (*see* **CARDIA**).

**cardiac arrest** the cessation of effective pumping action of the heart. This may be because the heart stops beating altogether (**\*asystole**), because there is normal electrical activity without mechanical pumping activity (**\*pulseless electrical activity**), or because there is rapid, chaotic, ineffective electrical and mechanical activity of the heart (ventricular **\*fibrillation** or **\*ventricular tachycardia**). There is abrupt loss of consciousness, absence of the pulse, and breathing stops. Unless treated promptly, irreversible brain damage and death follow within minutes. Some patients may be resuscitated by airway clearance and support, artificial ventilation, massage of the heart, and (if ventricular fibrillation or tachycardia is present) **\*defibrillation**.

**cardiac arrest simulation** a form of education in resuscitation skills using a **\*resuscitation manikin** wired up to a heart rhythm simulator that can mimic all common cardiac arrest situations. Candidates may be expected to perform basic life support as well as advanced life support and display skills in airway maintenance and team leadership. This form of teaching and assessment is widely used in advanced life support courses.

**cardiac-arrest team** a designated team of doctors in a hospital who attend **\*cardiac arrests** as they occur and administer protocol-driven treatment according to the latest guidelines. *See also* **MEDICAL EMERGENCY TEAM**.

**cardiac cycle** the sequence of events between one heartbeat and the next, normally occupying less than a second. The atria contract simultaneously and force blood into the relaxed ventricles. The ventricles then contract very strongly and pump blood out through the aorta and pulmonary artery. During ventricular contraction, the atria relax and fill up again with blood. *See* **DIASTOLE**; **SYSTOLE**.

**cardiac glycosides** *see* **GLYCOSIDE**; **DIGOXIN**.

**cardiac index** the volume of blood pumped from the heart's left ventricle divided by body surface area, expressed as litres per minute per square metre (l/min/m<sup>2</sup>). It is determined by heart rate and stroke volume index (the volume of blood pumped by the heart with each beat), and provides a normal range (2.5–4.0 l/min/m<sup>2</sup>) regardless of the size of the patient.

**cardiac muscle** the specialized muscle of which the walls of the **\*heart** are composed. It is composed of a network of branching elongated cells (fibres) whose junctions with neighbouring cells are marked by irregular transverse bands known as **intercalated discs**.

**cardiac output** the amount of blood ejected by the heart in a minute, as measured with a pulmonary artery catheter. The range is 4.0–8.0 l/min.

**cardiac reflex** reflex control of the heart rate. Sensory fibres in the walls of the heart are stimulated when the heart rate increases above normal. Impulses are sent to the cardiac centre in the brain, stimulating the vagus nerve and leading to slowing of the heart rate.

**cardiac rehabilitation** a programme of staged exercises and lifestyle classes designed for people recovering from a heart attack and run through the local hospital by dedicated health care professionals, who may include specialist nurses, occupational therapists, and physiotherapists.

**cardiac resynchronization therapy (CRT)** a treatment for heart failure that involves ventricular pacing with multiple **\*leads**. The aim is to restore coordinated ventricular contraction and hence improve cardiac function.

**cardiac tamponade** a dangerous situation in which there is a build-up of fluid around the heart within the pericardial sac. This causes compression of the heart, which is therefore unable to fill with blood adequately in order to pump effectively. Cardiac tamponade can result in heart failure, a drop in blood pressure, or cardiac arrest. It requires treatment by drainage of the fluid. The classical diagnostic features, known as **Beck's triad**, consist of dilated neck veins, a fall in blood pressure, and muffled heart sounds.

**cardinal veins** two pairs of veins in the embryo that carry blood from the head (**anterior cardinal veins**) and trunk (**posterior cardinal veins**); they unite to form the **common cardinal vein**, which drains into the sinus venosus of the heart.

**cardiogenic shock** *see* **HEART FAILURE**; **SHOCK**.

**cardiology** *n.* the science concerned with the study of the structure, function, and diseases of the heart. *See also* **NUCLEAR CARDIOLOGY**. —**cardiologist** *n.*

**cardiomyopathy** *n.* any chronic disorder affecting the muscle of the heart. It may be inherited but can be caused by various conditions, including virus infections, alcohol abuse, beriberi (vitamin B<sub>1</sub> deficiency), and amyloidosis. The cause is often unknown. It may result in enlargement of the heart, **\*heart failure**, **\*arrhythmias**, and **\*thromboembolism**. Modern drug treatment improves symptoms and prognosis. *See also* **HYPERTROPHIC CARDIOMYOPATHY**.

**cardiomyoplasty** *n.* a surgical technique to replace or reinforce damaged cardiac muscle with skeletal muscle. It is now rarely performed.

**cardiomyotomy** *n.* see [ACHALASIA](#); [MYOTOMY](#).

**cardioplegia** *n.* a technique in which the heart is stopped by injecting it with a solution of salts, by hypothermia, or by an electrical stimulus. This has enabled complex cardiac surgery and transplants to be performed safely.

**cardiopulmonary bypass** a method by which the circulation to the body is maintained while the heart is deliberately stopped during heart surgery. The function of the heart and lungs is carried out by a pump-oxygenator (see [HEART-LUNG MACHINE](#)) until the natural circulation is restored.

**cardiopulmonary resuscitation (CPR)** an emergency procedure for life support, consisting of artificial respiration and manual external cardiac massage. It is used in cases of cardiac arrest or apparent sudden death resulting from electric shock, drowning, respiratory arrest, or other causes, to establish effective circulation and ventilation in order to prevent irreversible brain damage. External cardiac massage compresses the heart, forcing blood into the systemic and pulmonary circulation; venous blood refills the heart when the compression is released. [\\*Mouth-to-mouth resuscitation](#) or a mechanical form of ventilation oxygenates the blood being pumped through the circulatory system.

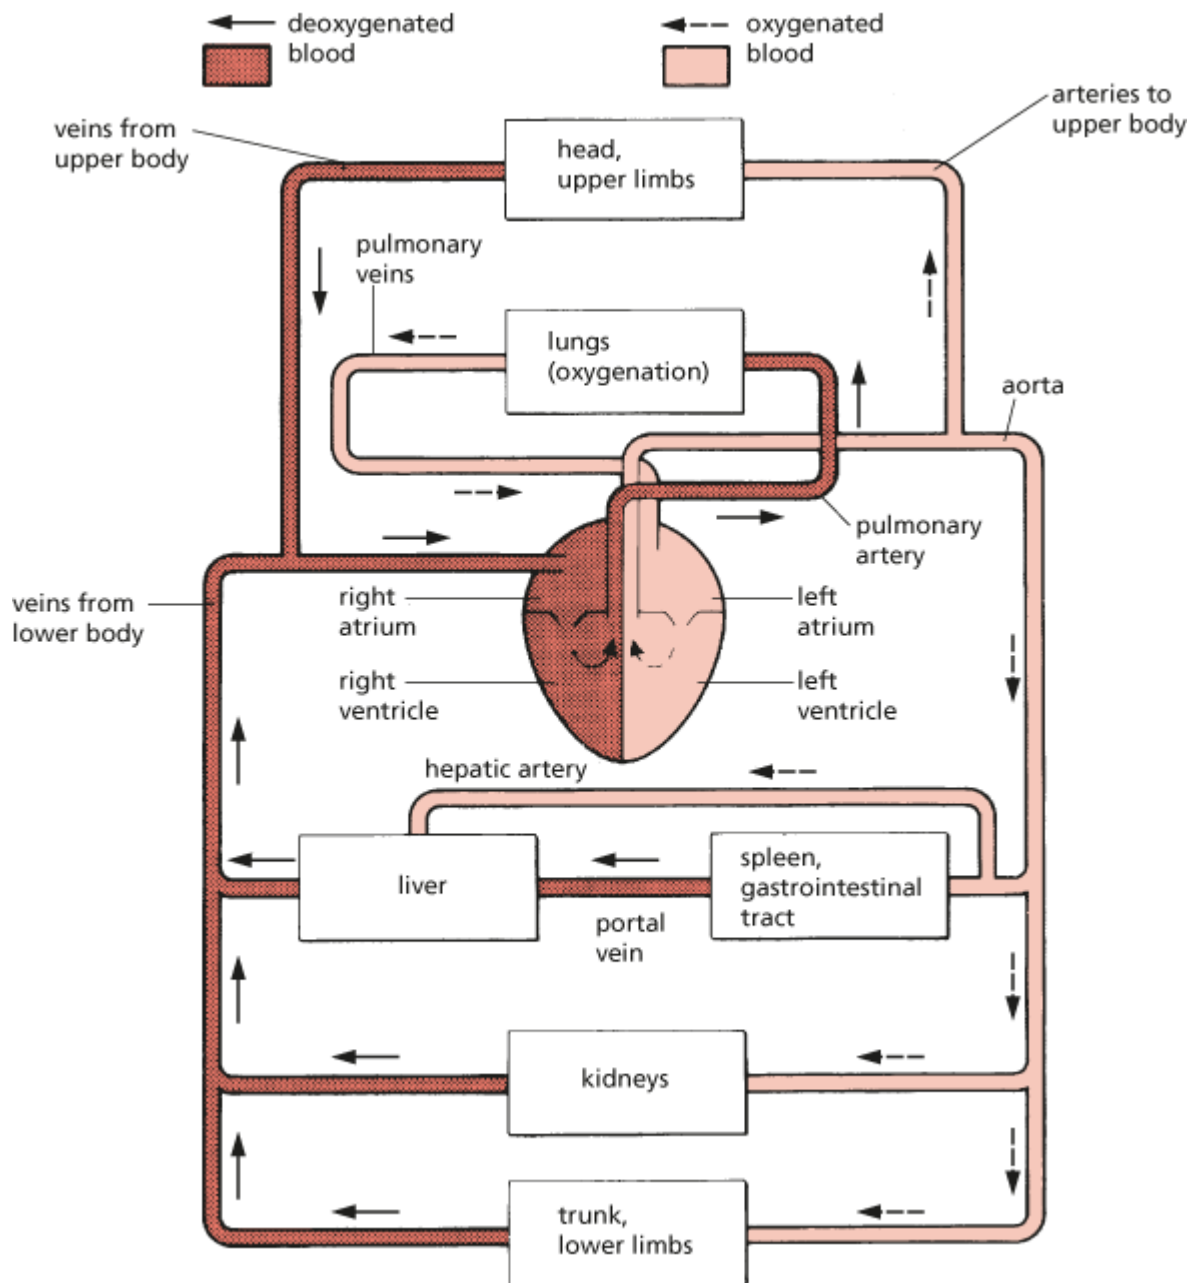

**cardiotocograph** *n.* the instrument used in [\\*cardiotocography](#) to produce a **cardiotocogram**, the graphic printout of the measurements obtained.

**cardiotocography** *n.* the electronic monitoring of the fetal heart rate and the frequency of uterine contractions. The former is detected by an external transducer or a fetal scalp electrode, and the latter by a second external transducer.

**cardiotomy syndrome (postcardiotomy syndrome)** a condition that may develop weeks or months after heart surgery and is characterized by fever and [\\*pericarditis](#). Pneumonia and pleurisy may form part of the syndrome. It is thought to be an [\\*autoimmune disease](#) and may be recurrent. A similar syndrome (**Dressler's syndrome**) may follow myocardial infarction. It may respond to anti-inflammatory drugs.

**cardiovascular system (circulatory system)** the heart together with two networks of blood vessels – the [\\*systemic circulation](#) and the [\\*pulmonary circulation](#) (see illustration). The cardiovascular system effects the

circulation of blood around the body, which brings about transport of nutrients and oxygen to the tissues and the removal of waste products.

**Cardiovascular system.**

**cardioversion (countershock)** *n.* restoration of normal heart rhythm in patients with tachyarrhythmia (see [ARRHYTHMIA](#)). Electrical (synchronized) cardioversion involves the application of a controlled shock, synchronized with the R wave of the *\*electrocardiogram*, through electrodes placed on the

chest wall of the anaesthetized patient. The apparatus is called a **cardioverter** and is a modified **\*defibrillator**. It is synchronized (usually by pressing a specific button on the control panel) because inadvertent delivery of the shock at the peak of the T wave can trigger ventricular fibrillation. Pharmacological cardioversion is achieved through oral, or more commonly intravenous, drug administration.

**care assistant** a person who helps with the general care of a patient, usually assisting a nurse or social worker with care of the vulnerable elderly in the community. Care assistants include home helps.

**Care Quality Commission (CQC)** a publicly funded independent organization established in 2009 and responsible for regulation of health and social care in England; it replaced the Healthcare Commission, the Commission for Social Care Inspection, and the Mental Health Act Commission. The responsibilities of the commission include publication of national health-care standards; annual assessment of the performance of NHS and social-care organizations; reviewing other (i.e. private and voluntary) health- and social-care organizations; reviewing complaints about the services when it has not been possible to resolve them locally; and investigating serious service failures.

<https://www.cqc.org.uk/>

- Website of the Care Quality Commission: includes guidance for health and social care professionals

**caries** *n.* decay and crumbling of the substance of a tooth (*see* **DENTAL CARIES**) or a bone. —**carious** *adj.*

**carina** *n.* a keel-like structure, such as the keel-shaped cartilage at the bifurcation of the trachea into the two main bronchi.

**cariogenic** *adj.* causing caries, particularly dental caries: the term refers especially to sugar-containing foods and drinks.

**cariology** *n.* the branch of dentistry concerned with the study of tooth decay (*see* **DENTAL CARIES**).

**carminative** *n.* a drug that relieves flatulence, used to treat gastric discomfort and colic.

**carmustine** *n.* a drug (an **\*alkylating agent**) used in the treatment of myeloma, non-Hodgkin lymphomas, and certain brain tumours (gliomas and glioblastoma). It may cause kidney damage.

**carneous mole** a fleshy mass in the uterus consisting of pieces of placenta and products of conception that have not been expelled after miscarriage.

**Caroli's disease** an inherited condition in which the bile ducts, which drain the liver, are widened, causing an increased risk of infection or cancer in the gall bladder. *Compare* **CAROLI'S SYNDROME**. [J. Caroli (20th century), French physician]

**Caroli's syndrome** an inherited condition in which the bile ducts, which drain the liver, are widened and there are fibrous changes in the liver and cysts within the kidneys. *Compare* **CAROLI'S DISEASE**. [J. Caroli]

**carotenaemia** *n.* *see* **XANTHAEMIA**.

**carotene** *n.* a yellow or orange plant pigment – one of the carotenoids – that occurs in four forms: alpha ( $\alpha$ ), beta ( $\beta$ ), gamma ( $\gamma$ ), and delta ( $\delta$ ). The most important form is  $\beta$ -carotene, which is an **\*antioxidant** and can be converted in the body to retinol (vitamin A). Good sources include yellow and green vegetables, such as carrots, sweet potato, and kale.

**carotenoid** *n.* any one of a group of about 100 naturally occurring yellow to red pigments found mostly in plants. The group includes the **\*carotenes**.

**carotid artery** either of the two main arteries in the neck whose branches supply the head and neck. The **common carotid artery** arises on the left side directly from the aortic arch and on the right from the innominate artery. They ascend the neck on either side as far as the thyroid cartilage (Adam's apple), where they each divide into two branches, the **internal carotid**, supplying the cerebrum, forehead, nose, eye, and middle ear, and the **external carotid**, sending branches to the face, scalp, and neck.

**carotid artery stenosis (carotid stenosis)** narrowing of the carotid artery, which reduces the supply of blood to the brain and is a cause of strokes. It is

treated by surgical excision or bypass of the narrowed segment (*see also* **ENDARTERECTOMY**) or by inserting a **\*stent** into the carotid artery.

**carotid body** a small mass of tissue in the carotid sinus containing **\*chemoreceptors** that monitor levels of oxygen, carbon dioxide, and hydrogen ions in the blood. If the oxygen level falls, the chemoreceptors send impulses to the cardiac and respiratory centres in the brain, which promote increases in heart and respiration rates. It can give rise to carotid body tumours, which are a form of **\*paraganglioma**.

**carotid sinus** a pocket in the wall of the carotid artery, at its division in the neck, containing receptors that monitor blood pressure (*see* **BARORECEPTOR**). When blood pressure is raised, impulses travel from the receptors to the vasomotor centre in the brain, which initiates a reflex **\*vasodilatation** and slowing of heart rate to lower the blood pressure to normal.

**carp-** (**carpo-**) *combining form denoting the wrist (carpus).*

**carpal 1.** *adj.* relating to the wrist. **2.** *n.* any of the bones forming the carpus.

**carpal tunnel** the space between the carpal bones of the wrist and the connective tissue (retinaculum) over the flexor tendons. It contains the flexor tendons and the median nerve.

**carpal tunnel syndrome** a combination of **\*paraesthesia** (pins and needles), numbness, and pain in the hand, usually affecting the thumb, index, and middle fingers and sometimes extending to the medial aspect of the fourth finger. The symptoms are usually worse at night, and in longstanding cases there may be weakness of grip due to wasting of the **\*thenar** eminence of the thumb. It is caused by pressure on the median nerve as it passes through the wrist (*see* **CARPAL TUNNEL**), which may result from any continuous repetitive movements of the hand, such as keyboarding, or any condition causing local swelling. It is common in rheumatoid arthritis, myxoedema, pregnancy, and at the menopause, when it is more likely to be bilateral. Treatment is by splinting of the wrist, **\*NSAIDs**, injection of a steroid, or – in severe cases – by surgical release of the nerve under local anaesthesia.

**carphology** *n.* *see* **FLOCCILLATION**.

**carpopedal spasm** *see* SPASM.

**carpus** *n.* the eight bones of the wrist (see illustration). The carpus articulates with the metacarpals distally and with the ulna and radius proximally.

**Carpus.** Bones of the left wrist and hand (from the front).

**carrier** *n.* **1.** a person who harbours the microorganisms causing a particular disease without experiencing signs or symptoms of infection and who can transmit the disease to others. **2.** (in genetics) a person who bears a gene for an abnormal trait without showing any signs of the disorder; the carrier is usually *\*heterozygous* for the gene concerned, which is *\*recessive*. **3.** an animal, usually an insect, that passively transmits infectious organisms from one animal to another or from an infected animal to a human being. *See also* VECTOR.

**carteolol** *n.* a *\*beta blocker* used as eye drops in the treatment of *\*glaucoma*; side-effects may include local stinging and burning.

**cartilage** *n.* a dense connective tissue composed of a matrix produced by cells called **chondroblasts**, which become embedded in the matrix as **chondrocytes**. It is a semiopaque grey or white substance, consisting chiefly of *\*chondroitin sulphate*, that is capable of withstanding considerable pressure. There are three types: *\*hyaline cartilage*, *\*elastic cartilage*, and

*\*fibrocartilage* (see illustration). In the fetus and infant cartilage occurs in many parts of the body, but most of this cartilage disappears during development. In the adult, hyaline cartilage is found in the costal cartilages, larynx, trachea, bronchi, nose, and covering the surface of bones at joints, where wear and damage results in *\*osteoarthritis*. Elastic cartilage occurs in the external ear, and fibrocartilage in the intervertebral discs and tendons. Cartilage is the precursor of bone following a fracture (see *CALLUS*).

### Types of cartilage.

**CARTO** *Trademark.* a system that uses magnetic localization technology to triangulate the position of a small sensor incorporated into the tip of a cardiac catheter. The signals from several catheters inserted simultaneously

are used to create an electrical map of the heart from within, identifying abnormal areas where **\*ablation** may be required.

**caruncle** *n.* a small red fleshy swelling. The **lacrimal caruncle** is the red prominence at the inner angle of the eye. **Hymenal caruncles** occur around the mucous membrane lining the vaginal opening.

**caseation** *n.* the breakdown of diseased tissue into a dry cheeselike mass: a type of **\*necrosis** associated with tubercular lesions.

**case control study** comparison of a group of people with a disease or condition and a control group of people free from that disease (e.g. people diagnosed with lung cancer and people without lung cancer). The groups are compared in terms of the frequency of **\*variables** in their backgrounds (e.g. cigarette smoking). This method can be used to investigate risk factors for diseases. In the more precise **matched pair study** each individual with the disease is paired with a control matched on the basis of (say) age, sex, and occupation: this places greater emphasis on the factors for which the pairs have not been matched. Compare **CROSS-SECTIONAL STUDY**, **LONGITUDINAL STUDY**.

**case fatality rate** the number of fatalities from a specified disease in a given period per 100 diagnosed cases of the disease arising in the same period. Unless deaths occur very rapidly after the onset of the disease (e.g. cholera), they may be the outcome of episodes that started in an earlier period. It is possible for more people to die from a condition than to develop it during the time period under investigation. Different time periods will be appropriate depending on the disease of interest. Comparison of the annual number of admissions and fatalities in a given hospital in respect of a specific disease is known as the **hospital fatality rate**.

**casein** *n.* a milk protein. Casein is precipitated out of milk in acid conditions or by the action of rennin: it is the principal protein of cheese. Casein is very easily prepared and is useful as a protein supplement, particularly in the treatment of malnutrition.

**case work** *see* **SOCIAL SERVICES**.

**Casodex** *n. see* **BICALUTAMIDE**.

**cassette** *n.* (in radiography) a thin light-proof box in which a piece of photographic film is placed. It usually contains special screens, which fluoresce on exposure to X-rays, intensifying the image formed on photographic film when a radiographic exposure is taken. In *\*computerized radiography* the cassette may contain an electrically charged plate.

**cast** *n.* **1.** a rigid casing for a limb or other part of the body, made of plaster of Paris, fibreglass, or plastic, that is designed to protect a broken bone and prevent movement of the aligned bone ends until healing has progressed sufficiently. **2.** a mass of dead cellular, fatty, and other material that forms within a body cavity and takes its shape. It may then be released and appear elsewhere. For example, *\*granular casts* appearing in the urine indicate kidney disease.

**cast nephropathy (myeloma kidney)** a complication of multiple myeloma seen in approximately half of those who have renal disease. The casts typically involve the distal convoluted and collecting tubules and often have a fractured or crystalline appearance. They are frequently surrounded by multinucleate giant cells. Deposition of the casts is associated with progressive renal failure.

**castration** *n.* removal of the sex glands (the testes or the ovaries). Castration in childhood causes failure of sexual development but when done in adult life (usually as part of hormonal treatment for cancer) it produces less marked physical changes in both sexes. Castration inevitably causes sterility but it need not cause impotence or loss of sexual desire.

**casuistry** *n.* **1.** case ethics: a method of ethical analysis that examines how the particular circumstances of different cases influence the ways in which general ethical principles should be applied. **2.** an excessively subtle misuse of case ethics used to confuse an issue or excuse a culprit.

**CAT** computerized axial tomography, now referred to as *\*computerized tomography* (CT).

**cata-** *prefix denoting downward or against.*

**catabolism** *n.* the chemical decomposition of complex substances by the body to form simpler ones, accompanied by the release of energy. The substances broken down include nutrients in food (carbohydrates, proteins,

etc.) as well as the body's storage products (such as glycogen). *See also* [METABOLISM](#). —**catabolic** *adj.*

**catagen** *n.* *see* [ANAGEN](#).

**catalase** *n.* an enzyme, present in many cells (including red blood cells and liver cells), that catalyses the breakdown of hydrogen peroxide.

**cataplexy** *n.* the abnormal maintenance of postures, occurring in [\\*catatonia](#). These may have arisen spontaneously or they may be induced by the examiner.

**catalyst** *n.* a substance that alters the rate of a chemical reaction but is itself unchanged at the end of the reaction. The catalysts of biochemical reactions are the [\\*enzymes](#).

**cataphoresis** *n.* the introduction into the tissues of positively charged ionized substances (cations) by the use of a direct electric current. *See* [IONTOPHORESIS](#).

**cataplasia** *n.* degeneration of tissues to an earlier developmental form.

**cataplexy** *n.* a sudden onset of muscle weakness that may be precipitated by excitement or emotion. There may be total loss of muscle tone, resulting in collapse, or simply jaw dropping or head nodding. It occurs in 60–90% of patients with [\\*narcolepsy](#).

**cataract** *n.* an opacity in the lens of the eye that may result in blurred vision. Minor degrees of cataract do not necessarily impair vision seriously. Cataracts may be congenital or acquired. The latter are most commonly a result of age (**senile cataract**); metabolic disease (such as diabetes), injury to the eye, or exposure of the eye to infrared rays (e.g. **glass-blowers' cataract**) or ionizing radiation can also cause a cataract. A type commonly related to ageing is **nuclear sclerotic cataract**, which results from increasing density and yellowing of the centre of the lens. A **posterior subcapsular cataract** (at the rear surface of the lens within the lens capsule) is also related to ageing but may occur with prolonged use of steroids and chronic ocular inflammation. **Brunescent cataracts** are dark brown and very dense, and a **cortical cataract** is one in which the opacity occurs in the soft outer part (cortex) of the lens. A **Morgagnian cataract** is a longstanding

very opaque cataract in which the cortex has started to shrink and liquefy, leaving a central shrunken nucleus.

Cataract is treated by removal of the affected lens (*see* [CATARACT EXTRACTION](#); [PHACOEMULSIFICATION](#)); patients may wear appropriate spectacles or a contact lens to compensate for the missing lens but in modern practice a synthetic **intraocular lens implant** is routinely placed inside the eye as a part of the surgical procedure.

**cataract extraction** surgical removal of a cataract from the eye. In **extracapsular cataract extraction** the cataract alone is removed, leaving the lens capsule behind. **Intracapsular cataract extraction** is the removal of the whole lens, including the capsule that surrounds it.

**catarrh** *n.* the excessive secretion of thick phlegm or mucus by the mucous membrane of the nose, nasal sinuses, nasopharynx, or air passages. The term is not used in any precise or scientific sense.

**catastrophic illness** a US term for a health condition that severely affects an individual's physical, mental, social, or economic wellbeing, lasts for an extended period of time, and (usually) requires very expensive treatment. In practice, the definition varies from government agency to agency and from employer to employer. The definition may focus specifically on the economic burden, the time lost from work, the seriousness of the condition, or a combination of these.

**catatonia** *n.* a state in which a person becomes mute or stuporous or adopts bizarre postures. The features include **waxy flexibility** (**flexibilitas cerea**), in which the limbs may be moved passively by another person into positions that are then retained for hours on end. Other common features include non-goal-directed excitement, [\\*posturing](#), [\\*negativism](#), rigidity, and **command automatism** (automatic compliance with instructions). Catatonia usually occurs in the context of [\\*schizophrenia](#), but is now rarely seen in developed countries. It remains common in developing countries. Treatment includes high-dose [\\*benzodiazepines](#) and [\\*electroconvulsive therapy](#). —**catatonic** *adj.*

**CATCH-22** *see* [DI GEORGE SYNDROME](#).

**catchment area** the geographic area from which a hospital can expect to receive patients and on which (in Britain) the designated population of the hospital is based. There is no statutory requirement for patients to use the hospital(s) of their area, but a code of zoning practice exists for some specialties (e.g. mental illness). A hospital may have a smaller catchment area for common specialties than for rarer ones, which may be shared between several districts (**regional specialty**) or regions (**supraregional specialty**).

**catecholamines** *pl. n.* a group of physiologically important substances, including **\*adrenaline**, **\*noradrenaline**, and **\*dopamine**, having various different roles (mainly as **\*neurotransmitters**) in the functioning of the sympathetic and central nervous systems. Chemically, all contain a benzene ring with adjacent hydroxyl groups (catechol) and an amine group on a side chain. Catecholamines act at both alpha ( $\alpha$ ) and beta ( $\beta$ ) **\*adrenoceptors**. Some tumours (e.g. **\*phaeochromocytoma**) secrete excess catecholamines.

**categorical imperative** *see* **IMPERATIVE**.

**catgut** *n.* a natural fibrous material prepared from the tissues of animals, usually from the walls of sheep intestines, twisted into strands of different thicknesses and formerly widely used to sew up wounds (*see* **SUTURE**) and tie off blood vessels during surgery. The catgut gradually dissolves and is absorbed by the tissues, so that the stitches do not have to be removed later. Catgut has now been replaced by synthetic absorbable suture material, such as vicryl.

**catharsis** *n.* **1.** purging or cleansing out of the bowels by giving the patient a **\*laxative** (cathartic) to stimulate intestinal activity. **2.** the release of strong pent-up emotions. *See* **ABREACTION**.

**cathartic** *n. see* **LAXATIVE**.

**cathepsin** *n.* one of a group of enzymes found in animal tissues, particularly the spleen, that digest proteins.

**catheter** *n.* a flexible tube for insertion into a narrow opening so that fluids may be introduced or removed (see illustration). **Urinary catheters** are

passed into the bladder through the urethra to allow drainage of urine in certain disorders and to empty the bladder before abdominal operations.

### Catheters.

**catheterization** *n.* the introduction of a **\*catheter** into a hollow organ or vessel. In **urethral catheterization** a catheter is introduced into the bladder through the urethra to relieve obstruction to the outflow of urine (*see also* **INTERMITTENT SELF-CATHETERIZATION**). Catheters can also be passed above the pubis through the anterior abdominal wall (**suprapubic catheterization**) directly into a full bladder if urethral catheterization is not possible. **Cardiac catheterization** entails the introduction of special catheters into the chambers of the heart. This allows the measurement of pressures in the chambers and pressure gradients across the heart valves, as well as the injection of contrast medium for visualization of structures using X-rays (*see* **CORONARY ANGIOGRAPHY**). **Vascular catheterization** enables the introduction into the arteries or veins of: (1) contrast medium for angiography or venography; (2) drugs to constrict or expand vessels or to dissolve a thrombus (*see* **THROMBOLYSIS**); (3) metal coils or other solid materials to block bleeding vessels or to thrombose **\*aneurysms** (*see* **EMBOLIZATION**); (4) devices for monitoring pressures within important

vessels (e.g. *\*Swan-Ganz catheters* for monitoring pulmonary artery pressure in critically ill patients); or (5) balloons and *\*stents* to relieve obstruction.

**cation** *n.* an ion of positive charge, such as a sodium ion (Na<sup>+</sup>). *Compare ANION. See ELECTROLYTE.*

**cation-exchange resins** complex insoluble chemical compounds that may be administered with the diet to alter the *\*electrolyte* balance of the body in the treatment of heart, kidney, and metabolic disorders. For example, in patients on a strict low-sodium diet such resins combine with sodium in the food so that it cannot be absorbed and passes out in the faeces.

**cat-scratch disease** an infectious disease caused by the bacterium *\*Bartonella henselae*, which infects cats and is transmitted to humans by a cat scratch or bite. A papule or pustule develops at the site of the injury followed, a week to two months after infection, by swelling of the lymph nodes (usually those closest to the wound). Fever and malaise are common. The condition usually resolves without treatment but antibiotics may be given to prevent complications.

**cauda** *n.* a tail-like structure. The **cauda equina** is a bundle of nerve roots from the lumbar, sacral, and coccygeal spinal nerves that descend nearly vertically from the spinal cord until they reach their respective openings in the vertebral column.

**cauda equina syndrome** damage to the *\*cauda equina*, the nerve roots arising from the terminal end of the spinal cord, due to trauma or compression. Without urgent surgical intervention, it can result in paralysis, loss of sensation in the legs, and bladder and bowel incontinence.

**caudal** *adj.* relating to the lower part or tail end of the body.

**caul** *n.* **1.** (in obstetrics) the *\*amnion*, either as a piece of membrane that covers an infant's head at birth or the entire unruptured sac that encloses the fetus during pregnancy. **2.** (in anatomy) *see OMENTUM.*

**causal agent** a factor associated with the definitive onset of an illness (or other response, including an accident). Examples are bacteria and trauma. The relationship is more direct than in the case of a *\*risk factor*; in general, the ill health only occurs if the agent is a precursor.

**causalgia** *n.* an intensely unpleasant burning pain felt in a limb where there has been partial damage to the sympathetic and somatic sensory nerves.

**caustic** *n.* an agent, such as silver nitrate, that destroys tissue. Caustic agents may be used to remove dead skin, warts, etc., but care must be taken not to damage the surrounding area.

**caustic soda** *see* **SODIUM HYDROXIDE**.

**cauterize** *vb.* to destroy tissues by direct application of a heated instrument (known as a **cautery**): used for the removal of small warts or other growths (*see also* **CURETTAGE**) and also to stop bleeding from small vessels. — **cautery** *n.*

**Caverject** *n. see* **ALPROSTADIL**.

**cavernitis** *n.* inflammation of the corpora cavernosa of the \***penis** or the corpus cavernosum of the clitoris.

**cavernosography** *n.* a radiological examination of the erectile tissue of the penis (*see* **CORPUS CAVERNOSUM**) that entails the infusion of \***radiopaque** contrast medium into the corpora cavernosa via a small butterfly needle. The contrast medium flow rate needed to maintain erection can be measured, and radiographs taken during the procedure give information regarding any abnormality of the veins draining the penis. It is mostly used in the evaluation of erectile dysfunction. Cavernosography can also be carried out with ultrasound and ultrasound contrast medium.

**cavernosometry** *n.* the measurement of pressure within the corpora cavernosa of the penis during infusion. The flow rate required to produce an erection is recorded and also the flow necessary to maintain the induced erection. The examination is important in the investigation of erectile dysfunction.

**cavernous breathing** *see* **BREATH SOUNDS**.

**cavernous sinus** one of the paired cavities within the \***sphenoid bone**, at the base of the skull behind the eye sockets, into which blood drains from the brain, eye, nose, and upper cheek before leaving the skull through connections with the internal jugular and facial veins. Through the sinus, in

its walls, pass the internal carotid artery and the abducens, oculomotor, trochlear, ophthalmic, and maxillary nerves.

**cavity** *n.* **1.** (in anatomy) a hollow enclosed area; for example, the abdominal cavity or the buccal cavity (mouth). **2.** (in dentistry) a. the hole in a tooth caused by *\*caries* or abrasion. b. the hole shaped in a tooth by a dentist to retain a filling.

**cavity varnish** (in dentistry) a solution of natural or synthetic resin in an organic solvent. It is used to provide a barrier against the passage of irritants from restorative materials and to reduce the penetration of oral fluids into the underlying *\*dentine*.

**cavogram** *n.* an image of the vena cava, either inferior or superior. After injecting a radiographic contrast medium in a peripheral vein, the vena cava can be imaged with X-rays (*see* **FLUOROSCOPY**) while the contrast arrives. Alternatively, a catheter can be inserted into a vein and advanced to the vena cava, then the contrast medium is injected to image it. Noninvasive imaging with CT or MRI scan is possible, but the image quality is inferior to fluoroscopic imaging.

**CBT** *see* **COGNITIVE BEHAVIOURAL THERAPY**.

**CBW (chemical and biological warfare)** the use of poisonous gases and other chemicals, bacteria, viruses, and toxins during war.

**CCDC** *see* **CONSULTANT IN HEALTH PROTECTION**.

**C cells** parafollicular cells of the thyroid gland, which are derived from neural crest tissue. They produce *\*calcitonin*. *\*Medullary carcinoma* of the thyroid has its origin in the C cells.

**CCF** congestive cardiac failure (*see* **HEART FAILURE**).

**CCG** *see* **CLINICAL COMMISSIONING GROUP**.

**CCT** Certificate of Completion of Training. *See* **CONSULTANT**.

**CCU** *see* **CORONARY CARE UNIT**.

**CD** cluster of differentiation: a numerical system for classifying antigens expressed on the surface of lymphocytes. *See also* **CD4**.

**CD4** a surface antigen on **\*helper T cells** that is particularly important for immune resistance to viruses. It is also a receptor for the human immunodeficiency virus (HIV); progressive reduction of CD4-bearing T cells reflects the progression of **\*AIDS**.

**CDH 1.** *see* **CONGENITAL DIAPHRAGMATIC HERNIA**. **2.** *see* **CONGENITAL DISLOCATION OF THE HIP**.

**C. diff** *Clostridium difficile*. *See* **CLOSTRIDIUM**.

**cefaclor** *n.* a second-generation **\*cephalosporin** antibiotic used in the treatment of otitis media, upper and lower respiratory-tract infections, urinary-tract infections, and skin infections. Side-effects include diarrhoea and skin eruptions.

**cefadroxil** *n.* a first-generation **\*cephalosporin** antibiotic used in the treatment of urinary-tract infections, skin infections, pharyngitis, and tonsillitis. Side-effects include skin rash and generalized itching.

**cefalexin** *n.* a first-generation **\*cephalosporin** antibiotic used in the treatment of respiratory-tract, genitourinary-tract, and skin infections and otitis media. Diarrhoea is the most common side-effect.

**cefotaxime** *n.* *see* **CEPHALOSPORIN**.

**ceftazidime** *n.* a third-generation **\*cephalosporin** antibiotic that has good activity against Gram-negative bacteria (including *Pseudomonas*). It is used for the treatment of urinary and respiratory tract infections, cellulitis, meningitis, and septicaemia. Side-effects include reaction at the site of injection, diarrhoea, and hypersensitivity reactions.

**cefuroxime** *n.* a second-generation **\*cephalosporin** antibiotic that is less susceptible to beta-lactamase enzymes than the older members of the group. It is used in the treatment of infections of the urinary and lower respiratory tracts and the skin, Lyme disease, gonorrhoea, epiglottitis, meningitis, and otitis media. Side-effects include nausea, diarrhoea, and rash.

**CEJ** *see* **CEMENTO-ENAMEL JUNCTION**.

**-cele (-coele)** *combining form denoting swelling, hernia, or tumour.*  
Example: **gastrocele** (hernia of the stomach).

**celecoxib** *n.* an anti-inflammatory drug (*see* **NSAID**) that selectively inhibits cyclo-oxygenase 2 (*see* **COX-2 INHIBITOR**). It is used in the treatment of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis.

**cell** *n.* the basic unit of all living organisms, which can reproduce itself exactly (*see* **MITOSIS**). Each cell is bounded by a **cell membrane** of lipids and protein, which controls the passage of substances into and out of the cell. Cells contain **\*cytoplasm**, in which are suspended a **\*nucleus** and other structures (**\*organelles**) specialized to carry out particular activities in the cell (*see* illustration).

Complex organisms are built up of millions of cells that are specially adapted to carry out particular functions. The process of cell differentiation begins early on in the development of the embryo and cells of a particular type (e.g. blood cells, liver cells) always give rise to cells of the same type. Each cell has a particular number of **\*chromosomes** in its nucleus. The sex cells (sperm and ova) always contain half the number of chromosomes of all the other cells of the body (*see* **MEIOSIS**); at fertilization a sperm and ovum combine to form a cell with a complete set of chromosomes that will develop into the embryo.

**An animal cell (microscopical structure).**

**cell body (perikaryon)** the enlarged portion of a **\*neuron** (nerve cell), containing the nucleus. It is concerned more with the nutrition of the cell than with propagation of nerve impulses.

**cell division** reproduction of cells by division first of the chromosomes (karyokinesis) and then of the cytoplasm (cytokinesis). Cell division to produce more body (somatic) cells is by **\*mitosis**; cell division during the formation of gametes is by **\*meiosis**.

**cellophane maculopathy** *see* **EPIRETINAL MEMBRANE**.

**cell saver** a machine that aspirates blood lost during surgery and immediately spins, washes, and filters it for retransfusion back into the patient's body (*see* **AUTOTRANSFUSION**). The process, called **intraoperative cell salvage**, is used in surgery that has significant blood loss, such as orthopaedic and vascular surgery and Caesarean section, and avoids the costs and risks of **\*allogeneic** transfusion.

**cell-surface molecules** molecules on the surface of cell membranes that are responsible for most cellular functions directly related to their immediate environment. Many have very precise functions of adhesion (see **ADHESION MOLECULES**), metabolic exchange, hormone reception, respiration, and immune reactions. Cell-to-cell exchanges involve specialized surface structures (junctions), which form a communicating nexus.

**cellulitis** *n.* an infection of the deep layers of the skin and subcutaneous tissue by staphylococci, streptococci, or other bacteria. The patient is systemically unwell and feverish. It is most common on the lower legs and there may be associated **\*lymphangitis** and **\*lymphadenitis**. It is otherwise similar to **\*erysipelas**, but the margins are less clearly defined because the infection is deeper. Intravenous antibiotics are often required.

**cellulose** *n.* a carbohydrate consisting of linked glucose units. It is an important constituent of plant cell walls. Cellulose cannot be digested by humans and is a component of **\*dietary fibre** (roughage).

**Celsius temperature (centigrade temperature)** temperature expressed on a scale in which the melting point of ice is assigned a temperature of 0° and the boiling point of water a temperature of 100°. For many medical purposes this scale has superseded the Fahrenheit scale (see **FAHRENHEIT TEMPERATURE**). The formula for converting from Celsius (C) to Fahrenheit (F) is:  $F = 9/5C + 32$ . [A. Celsius (1701–44), Swedish astronomer]

**cement** *n.* **1.** any of a group of materials used in dentistry either as fillings or as **\*lutes** for crowns. **\*Glass ionomer** cements are used for filling, whereas zinc phosphate, zinc polycarboxylate, and glass ionomer cements are used for luting. Zinc oxide–eugenol cements are widely used as temporary fillings or as an impression material. Advances in bonding have resulted in the development of universal resin cements that may be chemical curing or light-cured. **2. (bone cement)** a fast-setting material used to fix prostheses (e.g. artificial hips) in place and immobilize fractures. **3.** see **CEMENTUM**.

**cementocyte** *n.* a cell forming part of the cementum.

**cemento-enamel junction (CEJ)** the anatomical border where the **\*enamel** covering the crown of a tooth meets the **\*cementum** covering its root. Also

known as the ‘neck’ of a tooth, this is where, in health, the gingival margin is situated.

**cementoma** *n.* an **\*odontogenic tumour** that usually takes the form of a benign mass of hard tissue on the root of a tooth.

**cementoplasty** *n.* a technique of interventional radiology in which bone cement is injected through a wide-bore needle placed into the bone marrow of a fractured pelvis. This immobilizes the fracture and hence reduces the pain. *See also* **VERTEBROPLASTY**.

**cementum (cement)** *n.* a thin layer of hard tissue that covers the whole surface of the root of a **\*tooth**. It attaches the fibres of the **\*periodontal membrane** to the tooth.

**censor** *n.* (in psychology) the mechanism, postulated by Freud, that suppresses or modifies desires that are inappropriate or feared. The censor is usually regarded as being located in the **\*superego**, but was also described by Freud as being in the **\*ego** itself.

**census** *n.* an official count of the population within a defined territory, together with information on such attributes as age, sex, etc. In the UK it takes the form of a ten-yearly enumeration of the population based on the actual presence of individuals in a house or institution on a designated night (known as a **de facto census**). This contrasts with the approach in the USA, where enumeration is based on official address (**de jure census**).

**-centesis** *combining form denoting* puncture or perforation. Example: **amniocentesis** (surgical puncture of the amnion).

**centi-** *prefix denoting* one hundredth or a hundred.

**centigrade temperature** *see* **CELSIUS TEMPERATURE**.

**centile chart** a graph with lines showing average measurements of height, weight, and head circumference compared with age and sex, against which the physical development of a child or fetus can be assessed. The lines of growth on the graph are called **centiles**, and the number of a centile predicts the percentage of individuals who are below that measurement for a given age; for example, the 10th centile means that 10% of the age- and sex-matched population will be smaller and 90% will be bigger. A child or fetus

will normally follow a particular centile, but if growth crosses centiles or lies outside the 97th or 3rd centiles, further investigation may be warranted.

**central auditory processing disorder** *see* AUDITORY PROCESSING DISORDER.

**central island** an area of significant irregular astigmatism seen on **\*corneal topography** after laser refractive surgery. It may affect the postoperative outcome.

**central nervous system (CNS)** the **\*brain** and the **\*spinal cord**, as opposed to the cranial and spinal nerves and the **\*autonomic nervous system**, which together form the peripheral nervous system. The CNS is responsible for the **\*integration** of all nervous activities.

**central pontine myelinolysis** acute paralysis, dysphagia, and dysarthria resulting from damage to the myelin sheaths of nerve cells in the brainstem. It occurs most commonly as a complication of rapid correction of severe hyponatraemia (low serum sodium).

**central serous chorioretinopathy** shallow **\*retinal detachment** in the area of the macula due to a localized leakage through the retinal pigment epithelium (*see* RETINA) into the subretinal space. The cause is unknown. It affects young adult males, causing reduced or distorted central vision that usually settles in a few months.

**central venous catheter** an intravenous catheter for insertion directly into a large vein, most commonly the subclavian vein, during its passage under the clavicle, or the jugular in the neck. Such catheters can also be inserted into the femoral vein at the groin. They enable intravenous drugs and fluids to be given and intravenous pressures to be measured, which is often useful during operations or in intensive care. Central venous catheters must be inserted under strictly sterile conditions using a local anaesthetic.

**central venous pressure (CVP)** the pressure of blood within the right atrium. Measurement of CVP is obtained by **\*catheterization** of the right side of the heart; the catheter is attached to a manometer. CVP measurements are used to estimate circulatory function and blood volume in cases of shock or severe haemorrhage and to monitor blood replacement. In a recumbent patient, with the zero point of the manometer level with the mid-axilla (centre

of the armpit), CVP should measure between 5 and 8 cm saline under normal conditions. In clinical practice the CVP is often estimated by inspecting the *\*jugular venous pressure* (JVP).

**centre** *n.* (in neurology) a collection of neurons (nerve cells) whose activities control a particular function. The **respiratory** and **cardiovascular centres**, for example, are regions in the lower brainstem that control the movements of respiration and the functioning of the circulatory system, respectively.

**centrencephalic** *adj.* (in electroencephalography) describing discharges that can be recorded synchronously from all parts of the brain. The source of this activity is in the *\*reticular formation* of the midbrain. **Centrencephalic epilepsy** is associated with a congenital predisposition to seizures.

**centri-** *combining form denoting* centre. Example: **centrilobular** (in the centre of a lobule (especially of the liver)).

**centrifugal** *adj.* moving away from a centre, as from the brain to the peripheral tissues.

**centrifuge** *n.* a device for separating components of different densities in a liquid, using centrifugal force. The liquid is placed in special containers that are spun at high speed around a central axis.

**centriole** *n.* a small particle found in the cytoplasm of cells, near the nucleus. Centrioles are involved in the formation of the *\*spindle* and aster during cell division. During interphase there are usually two centrioles in the *\*centrosome*; when cell division occurs these separate and move to opposite sides of the nucleus, and the spindle is formed between them.

**centripetal** *adj.* moving towards a centre, as from the peripheral tissues to the brain.

**centromere (kinetochore)** *n.* the part of a chromosome that joins the two *\*chromatids* to each other and becomes attached to the spindle during *\*mitosis* and *\*meiosis*. When chromosome division takes place the centromeres split longitudinally.

**centrosome (centrosphere)** *n.* an area of clear cytoplasm, found next to the nucleus in nondividing cells, that contains the *\*centrioles*.

**centrosphere** *n.* **1.** an area of clear cytoplasm seen in dividing cells around the poles of the spindle. **2.** *see* **CENTROSOME**.

**centrum** *n.* (*pl.* **centra**) the solid rod-shaped central portion of a **\*vertebra**.

**cephal-** (**cephalo-**) *combining form denoting the head.* Example: **cephalalgia** (pain in).

**cephalad** *adj.* towards the head.

**cephalhaematoma** *n.* a swelling on the head caused by a collection of bloody fluid between one or more of the skull bones (usually the **\*parietal bone**) and its covering membrane (periosteum). It is most commonly seen in newborn infants delivered with the aid of forceps or vacuum extraction or subjected to pressures during passage through the birth canal. No treatment is necessary and the swelling disappears in a few months. If it is extensive, the blood in the fluid may break down, releasing bilirubin into the bloodstream and causing **\*jaundice**. A cephalhaematoma in an older baby or child is evidence of some recent injury to the head; occasionally an unsuspected fracture is revealed on X-ray. *See also* **CHIGNON**; **SUBAPONEUROTIC HAEMORRHAGE**.

**cephalic** *adj.* of or relating to the head.

**cephalic index** a measure of the shape of a skull, commonly used in **\*craniometry**: the ratio of the greatest breadth, multiplied by 100, to the greatest length of the skull. *See also* **BRACHYCEPHALY**; **DOLICHOCEPHALY**.

**cephalic version (external cephalic version)** a procedure in which a fetus that is lying in the breech position is turned so that its head will enter the birth canal first. It may give rise to complications (e.g. abruptio placentae) and is therefore only carried out in selected cases.

**cephalin** *n.* one of a group of **\*phospholipids** that are constituents of cell membranes and are particularly abundant in the brain.

**cephalocele** *n.* *see* **NEURAL TUBE DEFECTS**.

**cephalogram** *n.* a special standardized X-ray picture of the craniofacial area that can be used to measure alterations in the growth of skull bones, as used especially during orthodontic treatment. A lateral cephalometric radiograph is used to analyse skeletal, dentoalveolar, and soft tissue relationships in the anteroposterior and vertical dimensions.

**cephalometry** *n.* the study and measurement of facial growth by examination of standardized lateral cephalometric radiographs of the head. It is used mainly for diagnosis in **\*orthodontics**.

**cephalopelvic disproportion (CPD)** the state in which the diameter of the fetal head is greater than the pelvic outlet, preventing successful vaginal delivery. This may be relative when there is **\*malposition** of the vertex (back of the head) or absolute when the vertex is in the occipitoanterior position (see **OCCIPUT**), and can only be considered when the cervix is fully dilated.

**cephalosporin** *n.* any one of a group of semisynthetic **\*beta-lactam antibiotics**, derived from the mould *Cephalosporium*, which are effective against a wide range of microorganisms and are therefore used in a variety of infections. The older (first-generation) cephalosporins include **\*cefadroxil** and **\*cefalexin**; more recent (second-generation) drugs include **\*cefaclor** and **\*cefuroxime**. Third-generation cephalosporins, such as **\*ceftazidime**, **cefotaxime**, and **ceftriaxone**, have greater activity against Gram-negative bacteria. Cross-sensitivity with penicillin may occur and the principal side-effects are allergic reactions and irritation of the digestive tract.

**CEPOD** Confidential Enquiry into Peri-Operative Deaths: an influential enquiry by the Royal College of Surgeons of England that is used to monitor standards of surgical treatment. See also **CONFIDENTIAL ENQUIRIES**.

**CERA** see **CORTICAL EVOKED RESPONSE AUDIOMETRY**.

**cercaria** *n.* (*pl.* **cercariae**) the final larval stage of any parasitic trematode (see **FLUKE**). The cercariae, which have tails but otherwise resemble the adults, are released into water from the snail host in which the parasite undergoes part of its development. Several thousand cercariae may emerge from a single snail in a day.

**cerebellum** *n.* the largest part of the hindbrain, bulging back behind the pons and the medulla oblongata and overhung by the occipital lobes of the cerebrum. Like the cerebrum, it has an outer grey cortex and a core of white matter. Three broad bands of nerve fibres – the inferior, middle, and superior cerebellar peduncles – connect it to the medulla, the pons, and the midbrain respectively. It has two hemispheres, one on each side of the central region (the **vermis**), and its surface is thrown into thin folds called **folia** (see illustration). Within lie four pairs of nuclei.

**The cerebellum (anterior view).**

The cerebellum is essential for the maintenance of muscle tone, balance, and the synchronization of activity in groups of muscles under voluntary control, converting muscular contractions into smooth coordinated movement. It does not, however, initiate movement and plays no part in the perception of conscious sensations or in intelligence. —**cerebellar** *adj.*

**cerebr-** (**cerebri-**, **cerebro-**) *combining form denoting the cerebrum or brain.*

**cerebral abscess** *see* [ABSCESS](#).

**cerebral aqueduct (aqueduct of Sylvius)** the narrow channel, containing cerebrospinal fluid, that connects the third and fourth **\*ventricles** of the brain.

**cerebral cortex** the intricately folded outer layer of the **\*cerebrum**, making up some 40% of the brain by weight and composed of an estimated 15

thousand million neurons (*see* [GREY MATTER](#)). This is the part of the brain most directly responsible for consciousness, with essential roles in perception, memory, thought, mental ability, and intellect, and it is responsible for initiating voluntary activity. It has connections, direct or indirect, with all parts of the body. The folding of the cortex provides a large surface area, the greater part lying in the clefts (**sulci**), which divide the upraised convolutions (**gyri**). On the basis of its microscopic appearance in section, the cortex is mapped into [\\*Brodmann areas](#); it is also divided into functional regions; including [\\*motor cortex](#), [\\*sensory cortex](#), and [\\*association areas](#). Within, and continuous with it, lies the [\\*white matter](#), through which connection is made with the rest of the nervous system.

**cerebral haemorrhage** bleeding from a cerebral blood vessel into the tissue of the brain. It is commonly caused by degenerative disease of the arteries and high blood pressure but it may result from bleeding from congenital abnormalities of blood vessels. The extent and severity of the symptoms depend upon the site and volume of the haemorrhage; they vary from a transient weakness or numbness to profound coma and death. *See also* [ATHEROMA](#); [HYPERTENSION](#); [STROKE](#).

**cerebral hemisphere** one of the two paired halves of the [\\*cerebrum](#).

**cerebral palsy** a disorder of movement and/or posture as a result of nonprogressive but permanent damage to the developing brain. This damage may occur before, during, or immediately after delivery and has many causes, including an inadequate supply of oxygen to the brain, low levels of glucose in the blood ([\\*hypoglycaemia](#)), and infection. It is often associated with other problems, such as learning difficulties, hearing difficulties, poor speech, poor balance, and epilepsy. There are three main types of cerebral palsy: **spastic**, in which the limbs are difficult to control and which may affect the whole body (quadriplegic), one side of the body (hemiplegic), or both legs (diplegic); **ataxic hypotonic**, in which the main problem is poor balance and uncoordinated movements; and **dyskinetic**, in which there is involuntary movement of the limbs. Management requires a multidisciplinary approach, the main components of which are physiotherapy, speech and language therapy, educational assistance, and appropriate appliances.

<https://www.scope.org.uk/>

- Website of Scope, the UK's leading cerebral palsy charity

**cerebral tumour** an abnormal multiplication of brain cells. Any tumorous swelling tends to compress or even destroy the healthy brain cells surrounding it and – because of the rigid closed nature of the skull – increases the pressure on the brain tissue. Malignant brain tumours, which are much more common in children than in adults, include **\*medulloblastomas** and **\*gliomas**; these grow rapidly, spreading through the otherwise normal brain tissue and causing progressive neurological disability. Benign tumours, such as **\*meningiomas**, grow slowly and compress the brain tissue. Both benign and malignant tumours commonly cause fits. Benign tumours are often cured by total surgical resection. Malignant tumours may be treated by neurosurgery, chemotherapy, and radiotherapy, but the outcome for most patients remains poor.

**cerebral venous sinus thrombosis** the presence of thrombosis in the dural venous sinuses, which drain blood from the brain. Symptoms may include headache, abnormal vision, any of the symptoms of stroke (such as weakness of the face and limbs on one side of the body), and seizures. Treatment is with anticoagulants.

**cerebration** *n.* **1.** the functioning of the brain as a whole. **2.** the unconscious activities of the brain.

**cerebroside** *n.* one of a group of compounds occurring in the **\*myelin** sheaths of nerve fibres. They are **\*glycolipids**, containing a sphingolipid bound to a sugar, usually galactose (in **galactocerebrosides**) or glucose (in **glucocerebrosides**).

**cerebrospinal fever (spotted fever)** *see* **MENINGITIS**.

**cerebrospinal fluid (CSF)** the clear watery fluid that surrounds the brain and spinal cord. It is contained in the **\*subarachnoid space** and circulates in the **\*ventricles** of the brain and in the central canal of the spinal cord. The brain floats in the fluid (its weight so being reduced from about 1400 g to less than 100 g) and is cushioned by it from contact with the skull when the head is moved vigorously. The CSF is secreted by the **\*choroid plexuses** in the ventricles, circulates through them to reach the subarachnoid space, and is

eventually absorbed into the bloodstream through the *\*arachnoid* villi. Its normal contents are glucose, salts, enzymes, and a few white cells, but no red blood cells. See [Appendix 5](#).

**cerebrovascular disease** any disorder of the blood vessels of the brain and its covering membranes (meninges). Most cases are due to atheroma and/or hypertension, clinical effects being caused by rupture of diseased blood vessels (*\*cerebral* or *\*subarachnoid haemorrhage*) or inadequacy of the blood supply to the brain (ischaemia), due to cerebral thrombosis or embolism. The term **cerebrovascular accident** is given to the clinical syndrome accompanying a sudden and sometimes severe attack, which leads to a *\*stroke*.

**cerebrum (telencephalon)** *n.* the largest and most highly developed part of the brain, composed of the two **cerebral hemispheres**, separated from each other by the **longitudinal fissure** in the midline (see illustration). Each hemisphere has an outer layer of grey matter, the *\*cerebral cortex*, below which lies white matter containing the *\*basal ganglia*. Connecting the two hemispheres at the bottom of the longitudinal fissure is the **corpus callosum**, a massive bundle of nerve fibres. Within each hemisphere is a crescent-shaped fluid-filled cavity (lateral *\*ventricle*), connected to the central third ventricle in the *\*diencephalon*. The cerebrum is responsible for the initiation and coordination of all voluntary activity in the body and for governing the functioning of lower parts of the nervous system. The cortex is the seat of all intelligent behaviour. —**cerebral** *adj.*

**Lobes of the cerebrum (from the right side).**

**cerumen (earwax)** *n.* the waxy material that is secreted by the sebaceous glands in the external auditory meatus of the outer ear. Its function is to protect the delicate skin that lines the inside of the meatus.

**cervic- (cervico-)** *combining form denoting* **1.** the neck. Example: **cervicodynia** (pain in). **2.** the cervix, especially of the uterus. Example: **cervicectomy** (surgical removal of).

**cervical** *adj.* **1.** of or relating to the neck. **2.** of, relating to, or affecting the cervix (neck region) of an organ, especially the cervix of the uterus.

**cervical cancer (cervical carcinoma)** cancer of the neck (cervix) of the uterus. The tumour may develop from the surface epithelium of the cervix (squamous carcinoma) or from the epithelial lining of the cervical canal (adenocarcinoma). In both cases the tumour is invasive, spreading to involve surrounding tissue and subsequently to neighbouring lymph nodes and adjacent organs, such as the bladder and rectum. Cancer of the cervix can be detected in an early stage of development (*see* [CERVICAL SCREENING](#)) and diagnosis is established by biopsy (*see* [COLPOSCOPY](#)). In carcinoma in situ (*see* [CERVICAL INTRAEPITHELIAL NEOPLASIA](#)) the tumour is confined to

the epithelium: there is no invasion of surrounding tissue but, if untreated (by local ablation, *\*LLETZ*, or surgical excision), it can become invasive. Common early features of invasive disease are abnormal vaginal bleeding and a foul-smelling blood-stained vaginal discharge. Treatment is by surgery with or without postoperative radiotherapy. *See also* [HUMAN PAPILLOMAVIRUS](#).

**cervical cerclage** a procedure to help prevent *\*preterm* delivery. It involves inserting a purse-string suture around the cervix of the uterus between 12 and 14 weeks gestation, either transvaginally or transabdominally, to keep the cervix closed and reduce the possibility of preterm cervical dilatation and rupture of membranes.

**cervical ectopy** *see* [ECTROPION](#).

**cervical fracture** a fracture of a vertebra in the neck (*see* [CERVICAL VERTEBRAE](#)). Cervical fractures range from minor, requiring no treatment, to those associated with paralysis and instant death. Treatment can be support with a collar, skull traction, an *\*orthosis* attached to the skull, or surgery, depending on the severity of the fracture.

**cervical incompetence** spontaneous dilatation of the cervix of the uterus during the second trimester of pregnancy. The membranes bulge and subsequently rupture, and the fetus is expelled prematurely in a late miscarriage. It may be caused by forcible dilatation of the cervix during the operation of *\*dilatation and curettage* or it may be related to laceration of the cervix during a previous delivery or to previous cervical surgical procedures (e.g. knife *\*cone biopsy*).

**cervical intraepithelial neoplasia (CIN)** cellular changes in the cervix of the uterus preceding the invasive stages of *\*cervical cancer*. The CIN grading system distinguishes three stages: **CIN 1** (mild dysplasia); **CIN 2** (moderate dysplasia); and **CIN 3** (severe dysplasia, *\*carcinoma in situ*). CIN is uncommon after the menopause. Treatment may be by local ablation (e.g. cold coagulation (applying a heated probe to the *\*transformation zone*), cryocautery, electrodiathermy, or carbon dioxide *\*laser* vaporization) or by surgical excision (e.g. *\*LLETZ*, *\*cone biopsy*, or hysterectomy).

**cervical resistance index** measurement of the resistance of the cervix during the passage of a series of metal (Hegar) dilators. Lack of resistance in a nonpregnant women may suggest cervical weakness when she has experienced a previous second-trimester pregnancy loss or if she has had previous surgery to the cervix, and may indicate **\*cervical** cerclage in the event of future pregnancies.

**cervical screening** **\*screening tests** to detect the presence of precancerous changes in the cervix (neck) of the uterus (*see* **CERVICAL INTRAEPITHELIAL NEOPLASIA**). **\*Cervical smears** are the standard first-line screening tools in most countries: screening programmes based on the traditional **Papanicolaou (Pap) test** have been mostly superseded by **\*liquid-based cytology**. **\*Colposcopy** is indicated when abnormal cells (**\*dyskaryosis**) are detected.

**cervical smear** a specimen of cellular material scraped from the **\*transformation zone** of the cervix (neck) of the uterus that is stained and examined under a microscope in order to detect cell abnormalities indicating the presence of precancerous change. *See* **CERVICAL SCREENING**.

**cervical vertebrae** the seven bones making up the neck region of the **\*backbone**. The first cervical vertebra – the **atlas** – consists basically of a ring of bone that supports the skull by articulating with the occipital condyles (*see* **OCCIPITAL BONE**). The second vertebra – the **axis** – has an upward-pointing process (the **odontoid process** or **dens**) that forms a pivot on which the atlas can rotate, enabling the head to be turned. *See also* **VERTEBRA**.

**cervicitis** *n.* inflammation of the neck (cervix) of the uterus.

**cervix** *n.* a necklike part, especially the **cervix uteri** (neck of the uterus), which projects at its lower end into the vagina. The cervical canal passes through it, linking the cavity of the uterus with the vagina; the canal is lined with mucous membrane (*see* **ENDOCERVIX**) and normally contains mucus, the viscosity of which changes throughout the menstrual cycle. The cervix is capable of wide dilation during childbirth.

**cestode** *n.* *see* **TAPEWORM**.

**cetirizine** *n.* *see* **ANTI HISTAMINE**.

**cetrimide** *n.* a detergent disinfectant used alone or in combination for cleansing skin surfaces and wounds, for treating minor burns and abrasions, and as an ingredient of **\*barrier creams** for napkin rash and pressure sores. There are few adverse reactions from external application; most toxic effects are due to poisoning from ingestion.

**cetuximab** *n.* a drug (a **\*monoclonal antibody**) that acts as an inhibitor of **\*epidermal growth factor receptor** (EGFR), preventing tumour-cell growth. It is used, in combination with other agents, in the treatment of metastatic colorectal cancer and, in combination with radiotherapy, in the treatment of squamous cell carcinoma of the head and neck.

**CFA** cryptogenic fibrosing **\*alveolitis**.

**CFS/ME/PVF** a condition, known variously as **chronic fatigue syndrome**, **myalgic encephalomyelitis** (or **encephalopathy**), or **postviral fatigue syndrome**, characterized by extreme disabling fatigue that has lasted for at least six months, is made worse by physical or mental exertion, does not resolve with bed rest, and cannot be attributed to other disorders. The fatigue is accompanied by at least some of the following: muscle pain or weakness (**\*fibromyalgia**), poor coordination, joint pain, recurrent sore throat, slight fever, painful lymph nodes in the neck and armpits, depression, cognitive impairment (especially an inability to concentrate), and general malaise. The cause is unknown, but in some cases some viral conditions (especially glandular fever) are thought to trigger the disease; however, no viral aetiology has yet been identified. Treatment is restricted to relieving the symptoms and helping sufferers to plan their lives with a minimum of energy expenditure. Graded physiotherapy may be helpful in some cases. Many psychiatrists consider CFS/ME/PVF to be a mood disorder and use behavioural and cognitive techniques as well as antidepressants to treat it.

- Website of Action for ME: includes information for health-care professionals

**CGI** *see* **CLINICAL GLOBAL IMPRESSION**.

**Chagas' disease** a disease caused by the protozoan parasite *\*Trypanosoma cruzi*. It is transmitted to humans when the trypanosomes, present in the faeces of nocturnal bloodsucking *\*reduviid* bugs, come into contact with wounds and scratches on the skin or the delicate internal tissues of the nose and mouth. The presence of the parasite in the heart muscles and central nervous system results in serious inflammation and lesions, which can prove fatal. The disease, limited to poor rural areas of South and Central America, is especially prevalent in children and young adults. It may be treated with nifurtimox. *See also* **TRYPANOSOMIASIS**. [C. Chagas (1879–1934), Brazilian physician]

**chaining** *n.* (in psychology) a technique of *\*behaviour modification* in which a complex skill is taught by being broken down into its separate components, which are gradually built up into the full sequence. Usually the last component in the sequence is taught first, because it is this component that is followed by *\*reinforcement*: this is termed **backwards chaining**.

**chalazion (meibomian cyst)** *n.* a swollen sebaceous (meibomian) gland in the eyelid caused by blockage of its duct. The gland becomes inflamed and converted into a jelly-like mass, producing disfigurement of the lid. It may disappear spontaneously over a period of time but treatment by application of antibiotic ointments and/or surgical incision and curettage will result in its rapid cure.

**chalcosis** *n.* the deposition of copper in the tissues of the eye, usually resulting from the presence of a copper foreign body within the eye.

**chancre** *n.* a painless ulcer that develops at the site where infection enters the body, e.g. on the lips, penis, urethra, or eyelid. It is the primary symptom of such infections as sleeping sickness and syphilis.

**chancroid** *n.* *see* **SOFT SORE**.

**channelopathy** *n.* an inherited condition predisposing to arrhythmia that is characterized by a genetic mutation affecting one of the cell membrane channels responsible for transport of ions (e.g. potassium or sodium) into or out of the cardiac cells.

**CHAPS** *see* **CHILDREN'S AUDITORY PERFORMANCE SCALE**.

**Charcot–Leyden crystals** fine colourless sharp-pointed crystals seen in the sputum of asthmatics. [J. M. Charcot (1825–93), French neurologist; E. V. von Leyden (1832–1910), German physician]

**Charcot–Marie–Tooth disease (peroneal muscular atrophy)** a group of inherited diseases of the peripheral nerves, also known as **hereditary sensorimotor neuropathy**, causing a gradually progressive weakness and wasting of the muscles of the legs and the lower part of the thighs. The hands and arms are eventually affected. The genetic defect responsible for the most common form, type Ia, is a duplication on chromosome 17. The diagnosis is made by nerve conduction tests followed by genetic blood tests. [J. M. Charcot; P. Marie (1853–1940), French physician; H. H. Tooth (1856–1925), British physician]

**Charcot's joint** *see* **NEUROPATHIC ARTHRITIS**. [J. M. Charcot]

**Charcot's triad** the combination of pain in the right upper quadrant (*see* **ABDOMEN**), fever, and jaundice that is seen in acute **\*cholangitis**. [J. M. Charcot]

**charity patients** in the USA, very low-income patients who receive health care free or at reduced prices; criteria for eligibility differ from state to state, hospital to hospital, and physician to physician. Providers of charity care may be reimbursed through **\*Medicaid**, **\*Medicare**, or other government programmes. So-called **medically indigent patients** may also be eligible for help. These are patients who earn too much to qualify for charity care but not enough to afford health insurance, and who may incur medical bills that are far beyond their means. The **\*Affordable Care Act 2010** was intended largely to help those in this position.

**Charnley clamps** an apparatus used to encourage **\*arthrodesis** between the ends of two bones on either side of a joint. Parallel pins driven through the bone ends are connected on each side of the joint by bolts bearing wing nuts; tightening of the screw arrangements forces the surfaces of the bones together. When the two bones have joined, by growth and reshaping, the clamps can be removed. [Sir J. Charnley (1911–82), British orthopaedic surgeon]

**CHART** *n.* continuous hyperfractionated accelerated radiotherapy: a radiotherapy technique aimed at the rapid destruction of tumour cells when they are actively proliferating – and therefore most sensitive to radiation – by treating them several times a day over a greatly shortened total treatment time. The technique has been shown to be of benefit in the treatment of lung cancer.

**Chediak–Higashi syndrome** a rare fatal hereditary (autosomal *\*recessive*) condition causing enlargement of the liver and spleen, albinism, and abnormalities of the eye. It is thought to be due to a disorder of glycolipid metabolism. [A. Chediak (20th century), Cuban physician; O. Higashi (20th century) Japanese paediatrician]

**cheil- (cheilo-)** *combining form denoting the lip(s).* Example: **cheiloplasty** (plastic surgery of).

**cheilectomy** *n.* a surgical procedure involving the removal of *\*osteophytes* from around a degenerate joint to regain further range of motion. It is commonly performed in degenerative arthritis of the big toe (*see HALLUX RIGIDUS*).

**cheilitis** *n.* inflammation of the lips. **Angular cheilitis** affects the angles of the lips and may be caused by a staphylococcal or candidal infection, though mechanical, nutritional, and immune factors may be implicated.

**cheiloplasty** *n.* *see LABIOPLASTY.*

**cheiloschisis** *n.* *see CLEFT LIP.*

**cheilosis** *n.* swollen cracked bright-red lips. This is a common symptom of many nutritional disorders, including ariboflavinosis (vitamin B<sub>2</sub> deficiency).

**cheir- (cheiro-)** *combining form denoting the hand(s).* Examples: **cheiralgia** (pain in); **cheiroplasty** (plastic surgery of).

**cheiroarthropathy** *n.* the restricted hand movement seen in long-standing diabetes. Due to chronic thickening of the skin limiting joint flexibility, it is part of the *\*diabetic hand syndrome*.

**cheiopompholyx (acute vesicular eczema of the hands)** *n.* a type of blistering *\*eczema* affecting the palms and fingers. The thickness of the skin

in these areas prevents the pinhead vesicles from breaking and eventually the skin peels after a period of intense itching. *See* [POMPHOLYX](#).

**chelating agent** a chemical compound whose molecules form complexes by binding metal ions. Some chelating agents, including [\\*desferrioxamine](#) and [\\*penicillamine](#), are drugs used to treat metal poisoning: the metal is bound to the drug and excreted safely. Chelating agents often form the active centres of enzymes. The chelating agent ethylenediaminetetraacetic acid (EDTA) is used in dentistry to remove the [\\*smear](#) layer before root canal filling.

**chem- (chemo-)** *combining form denoting* chemical or chemistry.

**chemodectoma** *n.* a former name for [\\*paraganglioma](#).

**chemoembolization** *n.* a procedure in which the blood supply to a tumour is blocked with a synthetic embolic agent and cytotoxic drugs are then administered directly into the tumour. It is most frequently used for the treatment of liver cancer. *See also* [TRANSARTERIAL CHEMOEMBOLIZATION](#).

**chemokine** *n.* any one of a group of small proteins that guide leucocytes to sites of infection and are vital for immune function. They fall into two main classes, CC chemokines and CXC chemokines; receptors (denoted R) are named after the class that bind to them, and subtypes of each class are indicated by numbers (e.g. CCR5).

**chemoradiotherapy** *n.* the use of concurrent chemotherapy as a [\\*radiosensitizer](#) and radical irradiation in the treatment of malignant disease. Combined treatment in this way offers higher response rates, particularly in some gastrointestinal malignancies, such as rectal cancer and (particularly) anal cancer. It is also of proven benefit in locally advanced squamous cancers, such as those arising from the head and neck region or the cervix of the uterus.

**chemoreceptor** *n.* a cell or group of cells that responds to the presence of specific chemical compounds by initiating an impulse in a sensory nerve. Chemoreceptors are found in the taste buds and in the mucous membranes of the nose. *See also* [RECEPTOR](#).

**chemosis** *n.* swelling (oedema) of the **\*conjunctiva**. It is usually due to inflammation but may occur if the drainage of blood and lymph from around the eye is obstructed.

**chemotaxis** *n.* movement of a cell or organism in response to the stimulus of a gradient of chemical concentration.

**chemotherapy** *n.* the prevention or treatment of disease by the use of chemical substances. The term is increasingly restricted to the treatment of cancer with antimetabolites and similar drugs (*see* **CYTOTOXIC DRUG**) in contrast to **\*radiotherapy**, but is also still sometimes used for antibiotic and other treatment of infectious diseases.

**cherry angioma** *see* **ANGIOMA**.

**chest** *n.* *see* **THORAX**.

**Cheyne–Stokes respiration** a striking form of breathing in which there is a cyclical variation in the rate, which becomes slower until breathing stops for several seconds before speeding up to a peak and then slowing again. It occurs when the sensitivity of the respiratory centres in the brain is impaired, particularly in states of coma. [J. Cheyne (1777–1836), Scottish physician; W. Stokes (1804–78), Irish physician]

**chiasma** *n.* (*pl.* **chiasmata**) (in genetics) the point at which homologous chromosomes remain in contact after they have started to separate in the first division of **\*meiosis**. Chiasmata occur from the end of prophase to anaphase and represent the point at which mutual exchange of genetic material takes place (*see* **CROSSING OVER**).

**chickenpox** *n.* a highly infectious disease caused by a **\*herpesvirus** (the varicella-zoster virus) that is transmitted by airborne droplets. After an incubation period of 11–18 days a mild fever develops, followed after about 24 hours by an itchy rash of red pimples that soon change to vesicles. These usually start on the trunk or scalp and spread to the face and limbs; they crust over and resolve after about 12 days. Treatment is aimed at reducing the fever and controlling the itching (e.g. by the application of calamine lotion). Complications are rare but include secondary infection and occasionally **\*encephalitis**. The patient is infectious from two days before the spots appear

until they all scab over, usually five days after they first appeared. One attack usually confers life-long immunity, although the virus may reactivate at a later date and cause shingles (*see* [HERPES](#)). In adult patients who are particularly vulnerable, e.g. those with AIDS or who are otherwise immunosuppressed, chickenpox can be a serious disease, which may be treated with [\\*aciclovir](#). Medical name: **varicella**.

**chiclero's ulcer** a form of [\\*leishmaniasis](#) of the skin caused by the parasite *Leishmania tropica mexicana*. The disease, occurring in Panama, Honduras, and the Amazon, primarily affects men who visit the forests to collect chicle (gum) and takes the form of an ulcerating lesion on the ear lobe. The sore usually heals spontaneously within six months.

**Chief Medical Officer (CMO)** the most senior medical adviser to the UK government, who is responsible for providing expert advice on health issues (including health-related emergencies). The CMO is responsible to the Secretary of State for Health and acts as leader of profession for Directors of Public Health. There are separate CMOs appointed to advise the devolved governments in Scotland, Wales, and Northern Ireland.

**Chief Nursing Officer** the UK government's chief nursing adviser, who is responsible for providing an expert professional contribution and advice on nursing, midwifery, and health visiting matters to ministers and senior officials. There are separate Chief Nursing Officers appointed to advise the devolved governments in Scotland, Wales, and Northern Ireland.

**chigger** *n.* *see* [TROMBICULA](#).

**chignon** *n.* a temporary swelling on the head seen in newborn infants delivered with the aid of vacuum suction. *See also* [CEPHALHAEMATOMA](#); [SUBAPONEUROTIC HAEMORRHAGE](#).

**chigoe** *n.* *see* [TUNGA](#).

**chikungunya fever** a disease caused by an [\\*arbovirus](#) and transmitted to humans by mosquitoes of the genus *Aedes*. The disease is similar to [\\*dengue](#) and symptoms include fever, headache, joint and muscle pain, and an irritating rash. The patient is given drugs to relieve the pain and reduce the fever; the joint pain, which may progress to arthritis, can persist for up to

three years after the infection. Chikungunya was first reported in Tanzania in 1952 and has since occurred in over sixty countries worldwide.

**chilblains (perniosis)** *pl. n.* dusky red itchy swellings that develop on the extremities in cold weather. They usually settle in two weeks but treatment with **\*nifedipine** is helpful in severe cases. There may be a genetic predisposition to chilblains.

**child abuse** the maltreatment of children. It may take the form of **sexual abuse**, when a child is involved in sexual activity by an adult; **physical abuse**, when physical injury is caused by cruelty or undue punishment (*see* **NONACCIDENTAL INJURY**); **neglect**, when basic physical provision for needs is lacking; and **emotional abuse**, when lack of affection and/or hostility from caregivers damage a child's emotional development (*see* **ATTACHMENT DISORDER**).

<https://www.childline.org.uk/>

- ChildLine website: advice on physical, emotional, and sexual abuse from the NHS's Child and Adolescent Mental Health Services, together with a confidential helpline

**childbirth** *n. see* **LABOUR**.

**child health clinic** (in Britain) a special clinic for the routine care of infants and preschool children, formerly known as a **child welfare centre**. Sometimes these clinics are staffed by doctors, **\*health visitors**, and clinic nurses; the children attending them are drawn from the neighbourhood around the clinic. Alternatively, general practitioners may run their own child health clinic on a regular basis, with health visitors and other staff in attendance; it is unusual for children not registered with the practice to attend such clinics. The service provides screening tests for such conditions as **\*congenital dislocation of the hip**, suppressed squint (*see* **COVER TEST**), and impaired speech and/or hearing. The **\*Guthrie test** may also be performed if this has not been done before the baby leaves hospital. The staff of child health clinics also educate mothers (especially those having their first child) in feeding techniques and hygiene and see that children receive the

recommended immunizations against infectious diseases. They also ensure that the families of children with disabilities receive maximum support from health and social services and that such children achieve their maximum potential in the preschool period. *See also* [COMMUNITY PAEDIATRICIAN](#).

**child protection register** (in Britain) a confidential list of children whose social circumstances render them at risk of neglect or abuse. Each local authority maintains a register of children who are subject to a child protection plan, who will receive extra support and surveillance from health and/or social services. *See also* [SAFEGUARDING](#).

**Children's Auditory Performance Scale (CHAPS)** a questionnaire designed to assess children's hearing abilities in certain situations. It is used in the diagnosis of [\\*auditory processing disorder](#).

**children's centre (Sure Start Children's Centre)** a building housing a range of services to support children up to five years of age and their families, including childcare, early education, parenting advice, and access to health advice. Over 3 000 'Sure Start'-branded Children's Centres were established under Labour governments from 1997 to 2010. Many centres have subsequently closed, with the result that provision is no longer universal across the UK. *See also* [HEALTH INEQUALITIES](#).

**Child–Turcotte–Pugh score** a clinical scoring system used to predict the one- and two-year survival rates of patients with chronic liver disease. The score is determined by the assessment of two clinical signs (the presence of ascites and [\\*hepatic encephalopathy](#)) and three biochemical markers (serum bilirubin level, serum albumin level, and prothrombin time).

**Chinese herb nephropathy** a condition that came to prominence in the 1990s when hundreds of young European women developed end-stage renal disease after receiving slimming pills containing Chinese herbs. The condition is also associated with a high incidence of urothelial tumours. It was eventually proved that the product was contaminated with aristolochic acid, a main toxic product of [\\*Aristolochia](#) plant species. Its presence in the slimming regimen was the result of accidental substitution of the prescribed herb *Stephania tetrandra* (han fang-ji) by *A. fangchi* (guang fang-ji).

**chir- (chiro-)** *combining form denoting the hand(s)*. *See also* [CHEIR-](#).

**chiropody** *n.* see **PODIATRY**. —**chiropodist** *n.*

**chiropractic** *n.* a system of treating diseases by manipulation, mainly of the vertebrae of the backbone. It is based on the theory that nearly all disorders can be traced to the incorrect alignment of bones, with consequent malfunctioning of nerves and muscle throughout the body. Practitioners in the UK are required to register at the General Chiropractic Council, set up in 1997 to regulate the profession.

**chi-square test** (in statistics) a test to determine if the difference between two groups of observations is statistically significant (see **SIGNIFICANCE**), used in controlled trials and other studies. It measures the differences between theoretical and observed values and identifies whether or not **\*variables** are related.

**Chlamydia** *n.* a genus of Gram-negative bacteria that are **\*obligate** intracellular parasites in humans and other animals, in which they cause disease. *Chlamydia psittaci* causes **\*psittacosis**, and *C. trachomatis* is the causative agent of the eye disease **\*trachoma**. Some strains of *Chlamydia*, especially *C. trachomatis*, are a common cause of sexually transmitted infections, being responsible for nonspecific **\*urethritis** in men, **\*pelvic inflammatory disease** in women, and **\*inclusion conjunctivitis** in the newborn. *C. pneumoniae* causes pneumonia. —**chlamydial** *adj.*

**chloasma (melasma)** *n.* ill-defined symmetrical brown patches on the cheeks or elsewhere on the face. Chloasma is a **\*photosensitivity** reaction in women on combined oral contraceptive pills or who are pregnant; very rarely it occurs in men. It can usually be prevented by the use of sunscreens and may be treated with bleaching creams.

**chlor- (chloro-)** *combining form denoting* **1.** chlorine or chlorides. **2.** green.

**chloracne** *n.* an occupational acne-like skin disorder that occurs after regular contact with chlorinated hydrocarbons. These chemicals are derived from oil and tar products; ‘cutting oils’ used in engineering also cause the disease. The skin develops blackheads, papules, and pustules, mainly on hairy parts (such as the forearm). Warts and skin cancer may develop after many years of exposure to these chemicals.

**chloral hydrate** a sedative and hypnotic drug formerly widely used (as an oral solution) to induce sleep, mainly in children and the elderly; its derivative **cloral betaine** (Welldorm) is formulated as an elixir or tablets. Nausea, vomiting, and other gastrointestinal side-effects limit the use of these drugs. Prolonged use may lead to *\*dependence*.

**chlorambucil** *n.* an *\*alkylating agent* used in chemotherapy, mainly in the treatment of chronic lymphocytic leukaemia and some lymphomas. Prolonged large doses may cause damage to the bone marrow.

**chloramphenicol** *n.* an antibiotic, derived from the bacterium *Streptomyces venezuelae* and also produced synthetically, that is effective against a wide variety of microorganisms. However, due to its serious side-effects, especially damage to the bone marrow, it is usually reserved for serious infections (especially those caused by *\*Haemophilus influenzae*) when less toxic drugs are ineffective. Chloramphenicol is also used in the form of eye drops to treat superficial eye infections.

**chlordiazepoxide** *n.* a *\*benzodiazepine* drug with *\*muscle relaxant* properties, used for the short-term relief of anxiety and to lessen the severity of symptoms in alcohol withdrawal. Side-effects include drowsiness, lightheadedness, and shaky movements.

**chlorhexidine** *n.* an antiseptic widely used as a solution to disinfect and cleanse the skin (especially before surgery), wounds, and burns. It is also used in the form of a mouthwash, gel, or spray for treating gingivitis and mouth ulcers and as a solution for washing out urinary catheters and treating some bladder infections. Skin sensitivity to chlorhexidine occurs rarely.

**chlorination** *n.* the addition of noninjurious amounts of chlorine (often one part per million) to water supplies before human consumption to ensure that harmful microorganisms are destroyed. Higher concentrations of chlorine are also used to improve the microbiological suitability of bathing water (as in swimming pools). *See also* **FLUORIDATION**.

**chlorine** *n.* an extremely pungent gaseous element with antiseptic and bleaching properties. It is widely used to sterilize drinking water and purify swimming pools. In high concentrations it is toxic; it was used in World War I as a poison gas in the trenches. Symbol: Cl.

**chlormethiazole** *n.* see **CLOMETHIAZOLE**.

**chloroform** *n.* a volatile liquid formerly widely used as a general anaesthetic. Because its use as such causes liver damage and affects heart rhythm, chloroform is now used only in low concentrations as a flavouring agent and preservative, in the treatment of flatulence, and in liniments as a **\*rubefacient**.

**chlorophenothane** *n.* see **DDT**.

**chlorophyll** *n.* one of a group of green pigments, found in all green plants and some bacteria, that absorb light to provide energy for the synthesis of carbohydrates from carbon dioxide and water (photosynthesis). The two major chlorophylls, a and b, consist of a porphyrin/magnesium complex.

**chloropsia** *n.* green vision: a rare symptom of digitalis poisoning.

**chloroquine** *n.* a drug used principally in the treatment and prevention of benign **\*malariae** but also occasionally in the treatment of rheumatoid arthritis and lupus erythematosus. It may cause gastrointestinal disturbance, headache, and skin rashes or itching; a side-effect of prolonged use in large doses is eye damage. *See also* **PROGUANIL**.

**chlorphenamine (chlorpheniramine)** *n.* a potent **\*antihistamine** used to treat such allergies as hay fever and urticaria and in the emergency treatment of anaphylactic shock.

**chlorpromazine** *n.* a phenothiazine **\*antipsychotic** drug used in the treatment of schizophrenia and mania; it is also used to control nausea and vomiting in terminal illness. Common side-effects are drowsiness and dry mouth. It also causes abnormalities of movement, especially **\*dystonias**, **\*tardive dyskinesia**, and **\*parkinsonism**.

**chlortalidone (chlorthalidone)** *n.* a thiazide **\*diuretic** used to treat fluid retention (oedema), **\*ascites** due to cirrhosis, high blood pressure (hypertension), heart failure, and diabetes insipidus. It may cause a fall in blood pressure on standing up, dizziness, and reduced blood potassium levels.

**choana** *n.* (*pl.* **choanae**) a funnel-shaped opening, particularly either of the two openings between the nasal cavity and the pharynx.

**chokedamp** *n.* see **BLACKDAMP**.

**chol-** (**chole-**, **cholo-**) *combining form denoting bile.* Example: **cholemesis** (vomiting of).

**cholagogue** *n.* a drug that stimulates the flow of bile from the gall bladder and bile ducts into the duodenum.

**cholangiocarcinoma** *n.* a rare malignant tumour of the **\*bile ducts**. Clinical features include abdominal pain, weight loss, pruritus, obstructive jaundice, and abnormal liver function tests. A tumour located at the junction of the right and left hepatic ducts within the liver is known as a **Klatskin tumour**. Primary sclerosing **\*cholangitis**, **\*ulcerative colitis**, chronic infection with specific liver flukes (such as *Clonorchis sinensis*), and exposure to the imaging contrast agent Thorotrast are potential risk factors for the development of cholangiocarcinoma. Differentiation from other causes of bile duct **\*stricture(s)**, e.g. sclerosing cholangitis, can be very difficult.

**cholangiography** *n.* imaging of the bile ducts in order to demonstrate congenital anatomical abnormalities (such as biliary atresia), biliary diseases, and the presence of gallstones or strictures. It may be combined with imaging of the pancreatic duct (**cholangiopancreatography**), as in **endoscopic retrograde cholangiopancreatography** (see **ERCP**). **Magnetic resonance cholangiopancreatography (MRCP)** is a noninvasive **\*magnetic resonance imaging** technique that has largely superseded ERCP for diagnostic purposes. ERCP following MRCP is used for therapeutic intervention. In **operative (or on-table) cholangiography**, a radiopaque **\*contrast medium** is injected into the bile ducts during **\*cholecystectomy**, to ensure that there are no remaining gallstones in the ducts. **Percutaneous transhepatic cholangiography (PTC)** is an invasive technique in which a catheter is manipulated under direct fluoroscopic guidance through the anterior abdominal wall, across the liver, and into a bile duct; contrast solution is injected to outline the bile ducts. Using a **\*Seldinger technique**, drains or stents can be placed to treat infection or malignant strictures. **T-tube cholangiography** involves the postoperative injection of radiopaque contrast material via a drain (T-tube) left in the main bile duct after cholecystectomy.

**cholangioma** *n.* a benign tumour originating from the bile duct.

**cholangiopancreatography** *n.* *see* CHOLANGIOGRAPHY.

**cholangioscope** *n.* a flexible optical endoscope using digital video technology to visualize and sample the interior of the bile ducts.

**cholangitis** *n.* inflammation and secondary bacterial infection of the bile ducts due to biliary obstruction and stasis. Obstruction may be caused by gallstones, benign or malignant **\*stricture**, or intervention (such as ERCP). Symptoms include intermittent fever, usually with **\*rigors**; abdominal pain; and intermittent jaundice (a combination known as **Charcot's triad**). Treatment includes broad-spectrum antibiotics and decompression of the biliary tree to prevent recurrent infection. Liver abscesses may complicate cholangitis, and recurrent episodes of cholangitis can predispose to secondary biliary **\*cirrhosis**. **Sclerosing cholangitis** is an inflammatory disorder characterized by the progressive occlusion of intra- and extrahepatic bile ducts leading to stricture formation, liver cirrhosis, and subsequent liver failure. It is associated with **\*ulcerative colitis** and autoimmune disease.

**cholecalciferol** *n.* *see* VITAMIN D.

**cholecyst-** *combining form denoting the gall bladder.* Example: **cholecystotomy** (incision of).

**cholecystectomy** *n.* surgical removal of the gall bladder, usually for **\*cholecystitis**, gallstones, or biliary colic. Formerly performed by **\*laparotomy**, the operation is now usually done by **\*laparoscopy** (percutaneous laparoscopic cholecystectomy). *See also* MINIMALLY INVASIVE SURGERY.

**cholecystenterostomy** *n.* a surgical procedure in which the gall bladder is joined to the small intestine. It is performed in order to allow bile to pass freely from the liver to the intestine, bypassing an obstructed common bile duct.

**cholecystitis** *n.* inflammation of the gall bladder. **Acute cholecystitis** is a frequent complication of **\*gallstones** obstructing the cystic duct (*see* BILE DUCT) but in a minority of cases can occur in the absence of gallstones (**acute acalculous cholecystitis**). Initial treatment includes analgesia,

intravenous fluid therapy, and broad-spectrum antibiotics. **\*Cholecystectomy** is the definitive treatment. **Chronic cholecystitis** is an outdated term used for recurrent episodes of biliary colic; it should be avoided. *See also* **CHOLESTEROSIS**; **MURPHY'S SIGN**.

**cholecystoduodenostomy** *n.* a form of **\*cholecystenterostomy** in which the gall bladder is surgically anastomosed to the duodenum.

**cholecystography** *n.* X-ray examination of the gall bladder. In oral cholecystography a radiopaque contrast agent is administered by mouth, absorbed by the intestine, and excreted into bile, which is then concentrated in the gall bladder. An X-ray image (**cholecystogram**) may now be taken. As a technique to demonstrate the presence of gallstones, this has been replaced by ultrasound scanning. However, cholecystography is still sometimes used to look for any leakage or obstruction to drainage after surgery; in this case, the contrast medium is administered directly by catheter.

**cholecystokinin** *n.* a hormone secreted by the cells of the duodenum in response to the presence of partly digested food in the duodenum. It causes contraction of the gall bladder and expulsion of bile into the intestine and stimulates the production of digestive enzymes by the pancreas (*see also* **PANCREATIC JUICE**). In the brain cholecystokinin functions as a neurotransmitter, involved in the control of satiety.

**cholecystolithiasis** the presence of gallstones specifically in the gall bladder (as opposed to the common bile duct: *see* **CHOLEDOCHOLITHIASIS**).

**cholecystostomy (cholecystotomy)** *n.* an intervention in which a catheter is placed in an infected gall bladder to drain the pus. This is the preferred technique for patients who are unfit to undergo emergency removal of the gall bladder (**\*cholecystectomy**).

**choledoch- (cholecho-)** *combining form denoting the common bile duct.* Example: **choledochoplasty** (plastic surgery of).

**choledocholithiasis** *n.* gallstones within the common bile duct. Gallstones usually form in the gall bladder and pass through the cystic duct into the common bile duct. However, they may develop within the common bile duct itself, despite **\*cholecystectomy**.

**choledochoscope** *n.* a highly specialized endoscopic instrument used to visualize the common bile duct. This can aid removal of stones from the common bile duct during a laparoscopic **\*cholecystectomy**.

**choledochotomy** *n.* a surgical operation in which the common bile duct is opened in order to search for or to remove stones within it. It may be performed at the same time as **\*cholecystectomy** or if gallstones form in the bile duct after cholecystectomy.

**cholelithiasis** *n.* the presence of **\*gallstones** in the gall bladder (**\*cholecystolithiasis**) or the common bile duct (**\*choledocholithiasis**).

**cholelithotomy** *n.* removal of gallstones by **\*cholecystostomy**.

**cholera** *n.* an acute infection of the small intestine by the bacterium *Vibrio cholerae*, which causes severe vomiting and diarrhoea (known as **ricewater stools**) leading to dehydration. The disease is contracted from food or drinking water contaminated by faeces from a patient. Cholera often occurs in epidemics; outbreaks are rare in good sanitary conditions. After an incubation period of 1–5 days symptoms commence suddenly; the resulting dehydration and the imbalance in the concentration of body fluids can cause death within 24 hours in severe cases if untreated. Initial treatment involves replacing the fluid loss by **\*oral rehydration therapy**; tetracycline eradicates the bacteria and hastens recovery. The mortality rate in untreated cases is over 50%. Vaccination against cholera is effective for only 6–9 months.

**choleresis** *n.* the production of bile by the liver.

**choloretic** *n.* an agent that stimulates the secretion of bile by the liver thereby increasing the flow of bile.

**cholestasis** *n.* failure of normal amounts of bile to reach the intestine. This may be secondary to mechanical obstruction of the bile ducts, for example by gallstones or tumour (**extrahepatic biliary obstruction**), or to disturbances in bile formation (**intrahepatic cholestasis**). Many common drugs are associated with intrahepatic cholestasis, and it may occur in pregnancy (see **OBSTETRIC CHOLESTASIS**). The cardinal symptom of cholestasis is pruritus (itching); other symptoms include jaundice (more typical of extrahepatic cholestasis), dark urine, and pale stools.

**cholesteatoma** *n.* a skin-lined sac containing debris from dead skin cells that grows from the eardrum into the **\*mastoid** bone, eroding normal structures in its path. Left untreated, it can carry infection to the brain, causing meningitis or a cerebral **\*abscess**. Treatment is by means of **\*mastoidectomy**. Rarely, cholesteatoma can arise congenitally in the **\*temporal bone** or central nervous system.

**cholesterol** *n.* a fatlike material (a **\*sterol**) present in the blood and most tissues, especially nervous tissue. Cholesterol and its esters are important constituents of cell membranes and are precursors of many steroid hormones and bile salts. Western dietary intake is approximately 500–1000 mg/day. Cholesterol is synthesized in the body from acetate, mainly in the liver, and blood concentration is normally 140–300 mg/100 ml (3.6–7.8 mmol/l). An elevated concentration of cholesterol in the blood (*see* **HYPERCHOLESTEROLAEMIA**) is often associated with **\*atheroma**, of which cholesterol is a major component. Hypercholesterolaemia and the resulting atheroma have been linked with a high dietary intake of saturated fats and cholesterol. However, current thinking suggests that the damage to blood vessels is caused by high levels (over 4.4 mmol/l) of **\*low-density lipoprotein** (LDL), one of the forms in which cholesterol and other lipids are transported in the bloodstream. *See also* **HYPERLIPIDAEMIA**; **LIPOPROTEIN**.

**cholesterosis** *n.* an uncommon form of chronic inflammation of the gall bladder in which small crystals of cholesterol are deposited on the internal wall, like the pips of a strawberry: hence its descriptive term **strawberry gall bladder**. The crystals may enlarge to become **\*gallstones**.

**cholestyramine** *n.* *see* **COLESTYRAMINE**.

**cholic acid (cholalic acid)** *see* **BILE ACIDS**.

**choline** *n.* a basic compound important in the synthesis of phosphatidylcholine (lecithin) and other **\*phospholipids** and of **\*acetylcholine**. It is also involved in the transport of fat in the body. Choline is sometimes classed as a vitamin but, although it is essential for life, it can be synthesized in the body.

**cholinergic** *adj.* **1.** describing nerve fibres that release **\*acetylcholine** as a neurotransmitter. **2.** describing **\*receptors** at which acetylcholine acts to pass on messages from cholinergic nerve fibres. **3.** describing drugs that mimic the actions of acetylcholine (see **PARASYMPATHOMIMETIC**). *Compare* **ADRENERGIC**.

**cholinergic urticaria** *see* **URTICARIA**.

**cholinesterase** *n.* an enzyme that breaks down a choline ester into its choline and acid components. The term usually refers to **acetylcholinesterase**, which breaks down the neurotransmitter **\*acetylcholine** into choline and acetic acid. It is found in all **\*cholinergic** nerve junctions, where it rapidly destroys the acetylcholine released during the transmission of a nerve impulse so that subsequent impulses may pass. Other cholinesterases are found in the blood and other tissues.

**choluria** *n.* the presence of bile in the urine, which lends it a dark brown colour. Choluria is caused by liver disease, usually in cases of obstructive jaundice, and reflects an excess of bilirubin in the blood.

**chondr-** (**chondro-**) *combining form denoting* cartilage. Example: **chondrogenesis** (formation of).

**chondrin** *n.* a material that resembles gelatin, produced when cartilage is boiled.

**chondriosome** *n. see* **MITOCHONDRION**.

**chondroblast** *n.* a cell that produces the matrix of **\*cartilage**.

**chondroblastoma** *n.* a tumour derived from **\*chondroblasts**, having the appearance of a mass of well-differentiated cartilage.

**chondrocalcinosis** *n.* the appearance of calcific material in joint cartilage, most commonly an incidental finding on X-ray of the knees in elderly patients and usually causing no symptoms. Calcification of cartilage may also be seen at the shoulder and in the fibrocartilage of the wrist. It may be associated with osteoarthritis. It is also seen less commonly in several other disorders, including Wilson's disease, pseudogout, hyperparathyroidism, hypothyroidism, and haemochromatosis.

**chondroclast** *n.* a cell that is concerned with the absorption of cartilage.

**chondrocranium** *n.* the embryonic skull, which is composed entirely of cartilage and is later replaced by bone. *See also* **MENINX**.

**chondrocyte** *n.* a **\*cartilage** cell, found embedded in the matrix.

**chondrodermatitis nodularis helicis** a fairly common painful nodule on the upper part of the ear. It occurs mainly in middle-aged or elderly men and characteristically prevents the sufferer from sleeping on the affected side; it is readily treated by being cut out.

**chondrodysplasia (chondro-osteodystrophy, chondrodystrophy)** *n.* any of various conditions in which there is abnormal cartilage development. It affects long bones and can cause short-limb dwarfism, overgrowth of the epiphysis, or other deformities. One particular form is an autosomal **\*recessive** syndrome most commonly found in Old Order Amish populations. *See also* **ACHONDROPLASIA**.

**chondroitin sulphate** a mucopolysaccharide that forms an important constituent of cartilage, bone, and other connective tissues. It is composed of glucuronic acid and N-acetyl-D-galactosamine units. Although it is sold as a supplement to help with joint pain, evidence of any benefit is limited.

**chondroma** *n.* a relatively common benign tumour of cartilage-forming cells, which may occur at the growing end of any bone but is found most commonly in the bones of the feet and hands. It may be a chance finding on X-ray, it may expand the bone, or it may be the site of a **\*pathological fracture**.

**chondromalacia** *n.* softening, inflammation, and degeneration of cartilage at a joint. **Chondromalacia patellae** is the most common kind, affecting the undersurface of the kneecap; it results in pain in the front of the knee and grating (**\*crepitus**), which is made worse by kneeling, squatting, and climbing stairs. Treatment includes physiotherapy, ice packs, anti-inflammatory drugs (NSAIDs), weight loss, and avoidance of aggravating factors, such as running and jumping.

**chondroplasty** *n.* the refashioning of articular cartilage, commonly performed by shaving areas of worn and unstable cartilage with the aid of an **\*arthroscope**.

**chondrosarcoma** *n.* an uncommon malignant tumour of cartilage cells occurring in a bone, most frequently in the femur, humerus, ribs, or pelvis, and most commonly affecting adults in their fifties and sixties. It has a typical 'snowstorm' appearance on X-ray. Treatment is by surgical removal; these tumours are not usually sensitive to radiotherapy or chemotherapy.

**choose and book** *see* [NHS E-REFERRAL SERVICE](#).

**chord-** (**chordo-**) *combining form denoting* **1.** a cord. **2.** the notochord.

**chorda** *n.* (*pl.* **chordae**) a cord, tendon, or nerve fibre. The **chordae tendineae** are stringlike processes in the heart that attach the margins of the mitral and tricuspid valve leaflets to projections of the wall of the ventricle (**papillary muscles**). Rupture of the chordae, through injury, endocarditis, or degenerative changes, results in [\\*mitral regurgitation](#).

**chordee** *n.* abnormal curvature or angulation of the penis. In [\\*Peyronie's disease](#), this is due to a localized fibrous plaque in the penis, which fails to engorge on erection. As a result, the penis angulates at this point making intercourse impossible. In a child, downward chordee is an associated deformity in [\\*hypospadias](#) and the more severe forms are corrected surgically.

**chordoma** *n.* a rare tumour arising from remnants of the embryologic [\\*notochord](#). The classical sites are the base of skull and the region of the sacrum.

**chorea** *n.* a jerky involuntary movement particularly affecting the head, face, or limbs. Each movement is sudden but the resulting posture may be prolonged for a few seconds. The symptoms are usually due to disease of the [\\*basal ganglia](#) but may result from drug therapy for [\\*parkinsonism](#) or phenothiazines. Such movements are characteristic of [\\*Huntington's disease](#), in which they are associated with progressive dementia. *See also* [SYDENHAM'S CHOREA](#).

**chorioamnionitis** *n.* inflammation and infection of the inner and outer fetal membranes, often after preterm premature rupture of membranes ([\\*PPROM](#)). This condition is associated with poor fetal outcome and can lead to maternal sepsis from [\\*endometritis](#).

**choriocarcinoma (chorionepithelioma)** *n.* a rare malignant tumour of the placenta originating in the outer membrane (chorion) surrounding the fetus. Usually it is a complication of a **\*hydatidiform mole**, although it may follow a miscarriage or even a normal pregnancy. The tumour rapidly spreads to the lungs, but is usually very sensitive to chemotherapy. It produces high levels of beta **\*human chorionic gonadotrophin** (hCG), which can be monitored as a tumour marker. *See also* **GESTATIONAL TROPHOBLASTIC NEOPLASIA**.

**chorion** *n.* the embryonic membrane that totally surrounds the embryo from the time of implantation. It is formed from **\*trophoblast** lined with mesoderm and becomes closely associated with the **\*allantois**. The blood vessels (supplied by the allantois) are concentrated in the region of the chorion that is attached to the wall of the uterus and forms the **\*placenta**. *See also* **VILLUS**. —**chorionic** *adj.*

**chorionicity** the number of chorionic membranes present on direct examination of the placenta and membranes following delivery of **\*twins**. Chorionicity can be determined antenatally by ultrasound, ideally between 10 and 14 weeks gestation. Where two placental masses are identified, the pregnancy is **dichorionic**. More frequently a single placental mass exists and chorionicity can only be determined by evaluation of the intertwin membrane; the pregnancy is **monochorionic** when the fetuses share a chorion (see illustration; *see also* **LAMBDA SIGN**; **T-SIGN**). Chorionicity rather than zygosity is a better determinant of perinatal outcome in twins. The perinatal mortality rate of monochorionic pregnancies may be up to four times that of dichorionic.

### Chorionicity.

**chorionic villus sampling (CVS)** an invasive procedure for **\*prenatal diagnosis** in which a sample of placental tissue (containing chorionic **\*villi**) is aspirated through the cervix or abdomen under ultrasound visualization. It is usually performed between the 10th and 13th weeks of gestation. The cells so obtained are subjected to chromosomal analysis to determine if any abnormalities are present in the fetus. This enables the diagnosis of chromosomal abnormalities, such as Down's syndrome.

**chorioretinopathy** *n.* any eye disease involving both the choroid and the retina. See **CENTRAL SEROUS CHORIORETINOPATHY**.

**choristoma** *n.* a mass of tissue composed of tissue not normally found at the affected site. A **\*dermoid cyst** is an example.

**choroid** *n.* the layer of the eyeball between the retina and the sclera (*see also* **BRUCH'S MEMBRANE**). It contains blood vessels and a pigment that absorbs

excess light and so prevents blurring of vision. *See* [EYE](#). —**choroidal** *adj.*

**choroidal detachment** the separation of the [\\*choroid](#) from the [\\*sclera](#) of the eye as a result of leakage of fluid from the vessels of the choroid. It occurs when pressure inside the eyeball is very low, usually after trauma or intraocular surgery.

**choroideraemia** *n.* a sex-linked hereditary condition in which the retinal pigment epithelium (*see* [RETINA](#)) and the choroid begin to degenerate in the first few months or years of life. In males this results in blindness, but in females it rarely causes any significant visual loss.

**choroiditis** *n.* inflammation of the choroid layer of the eye. It may be inflamed together with the iris and ciliary body (*see* [UVEITIS](#)) but often is involved alone and in patches (**focal** or **multifocal choroiditis**). Vision becomes blurred but the eye is usually pain-free.

**choroid plexus** a rich network of blood vessels, derived from those of the pia mater, in each of the brain's ventricles. It is responsible for the production of [\\*cerebrospinal fluid](#).

**CHP** *see* [CONSULTANT IN HEALTH PROTECTION](#).

**Christmas disease (haemophilia B)** a disorder that is identical in its effects to [\\*haemophilia A](#), but is due to a deficiency of a different blood coagulation factor, the **Christmas factor** (Factor IX). [S. Christmas (20th century), in whom the factor was first identified]

**chrom- (chromo-)** *combining form denoting* colour or pigment.

**chromaffin** *n.* tissue in the medulla of the [\\*adrenal gland](#) consisting of modified neural cells containing granules that are stained brown by chromates. Adrenaline and noradrenaline are released from the granules when the adrenal gland is stimulated by its sympathetic nerve supply. *See also* [NEUROHORMONE](#).

**-chromasia** *combining form denoting* staining or pigmentation.

**chromat- (chromato-)** *combining form denoting* colour or pigmentation.

**chromatid** *n.* one of the two threadlike strands formed by longitudinal division of a chromosome during **\*mitosis** and **\*meiosis**. They remain attached at the **\*centromere**. Chromatids can be seen between early prophase and metaphase in mitosis and between diplotene and the second metaphase of meiosis, after which they divide at the centromere to form daughter chromosomes.

**chromatin** *n.* the material of a cell nucleus that stains with basic dyes and consists of DNA and protein: the substance of which the chromosomes are made. See **EUCHROMATIN**; **HETEROCHROMATIN**.

**chromatography** *n.* any of several techniques for separating the components of a mixture by selective absorption. Two such techniques are quite widely used in medicine, for example to separate mixtures of amino acids. In one of these, **paper chromatography**, a sample of the mixture is placed at the edge of a sheet of filter paper. As the solvent soaks along the paper, the components are absorbed to different extents and thus move along the paper at different rates. In **column chromatography** the components separate out along a column of a powdered absorbent, such as silica or aluminium oxide.

**chromatolysis** *n.* the dispersal or disintegration of the microscopic structures within the nerve cells that normally produce proteins. It is part of the cell's response to injury.

**chromatophore** *n.* a cell containing pigment. In humans chromatophores containing **\*melanin** are found in the skin, hair, and eyes.

**chromatopsia** *n.* abnormal coloured vision: a rare symptom of various conditions. Sometimes everything looks reddish to patients after removal of their cataracts; patients suffering from digitalis poisoning may see things in green or yellow. Similar disturbances of colour may be experienced by people recovering from inflammation of the optic nerve.

**chromium** *n.* a **\*trace element**, thought to be part of the complex that maintains blood sugar levels and controls insulin. Deficiency has been observed in patients on long-term **\*total parenteral nutrition** (TPN). Symbol: Cr.

**chromoblastomycosis (chromomycosis)** *n.* a chronic fungal infection of the skin usually occurring at the site of an injury; for example, a wound from a

wood splinter. It produces pigmented wartlike lumps on exposed areas that sometimes ulcerate. In the immunocompromised it may spread rapidly and even prove fatal.

**chromogen** *n.* any agent in certain foods and drinks, such as red wine, coffee, and berries, that stains the enamel of teeth. Chromogenic bacteria may also produce hydrogen sulphide that reacts with oral saliva to result in coloured staining (normally black).

**chromophobe (chromophobic)** *adj.* describing cells or tissues that do not stain well with either acidic or basic dyes. Chromophobic cells may be seen, for example, in the anterior pituitary gland. *See also* [ADENOMA](#).

**chromosome** *n.* one of the threadlike structures in a cell nucleus that carry the genetic information in the form of *\*genes*. It is composed of a long double filament of *\*DNA* coiled into a helix together with associated proteins, with the genes arranged in a linear manner along its length. It stains deeply with basic dyes during cell division (*see* [MEIOSIS](#); [MITOSIS](#)). The nucleus of each human somatic cell contains 46 chromosomes, 23 of which are of maternal and 23 of paternal origin (see illustration). Each chromosome can duplicate an exact copy of itself between each cell division (*see* [INTERPHASE](#)) so that each new cell formed receives a full set of chromosomes. *See also* [CHROMATID](#); [CENTROMERE](#); [SEX CHROMOSOME](#). —**chromosomal** *adj.*

**Chromosome.** Human male chromosomes, arranged in numbered pairs according to a standard classification. The female set differs only in the sex chromosomes (XX instead of XY).

**chron-** (**chrono-**) *combining form denoting time.* Example: **chronophobia** (abnormal fear of).

**chronic** *adj.* **1.** describing a disease of long duration involving very slow changes. Such a disease is often of gradual onset. The term does not imply anything about the severity of a disease. *Compare* **ACUTE**. **2.** describing a type of inflammation characterized by the presence of lymphocytes, plasma cells, and macrophages. —**chronicity** *n.*

**chronic fatigue syndrome** *see* **CFS/ME/PVF**.

**chronic idiopathic facial pain** *see* **PERSISTENT IDIOPATHIC FACIAL PAIN**.

**chronic obstructive pulmonary disease (COPD, chronic obstructive airways disease)** a disease of adults, especially those over the age of 45 with a history of smoking or inhalation of airborne pollution, characterized by airflow obstruction that is not fully reversible. The disease has features of **\*emphysema**, chronic **\*bronchitis**, and asthmatic bronchitis. It is now diagnosed, according to the **\*GOLD** guidelines, at different stages:

Stage 0: the presence of risk factors and symptoms (e.g. cough and wheeze) with normal **\*forced expiratory volume** in 1 second (FEV<sub>1</sub>).

Stage 1: FEV<sub>1</sub> is normal, but the ratio of FEV<sub>1</sub> to forced **\*vital capacity** (FVC) is less than 70%.

Stage 2: FEV<sub>1</sub> is less than 80% but more than 50% of the predicted value for the patient's age and height.

Stage 3: FEV<sub>1</sub> less than 50% but more than 30%.

Stage 4: FEV<sub>1</sub> less than 30% or the presence of chronic respiratory failure.

The guidelines for COPD recommend different treatment regimens for different stages. Although the response to inhaled corticosteroids is less for COPD than for asthma, these drugs, especially combined with inhaled long-acting beta agonists (e.g. **\*salmeterol**), can improve quality of life and survival in stages 3 and 4. There is also a decrease in the number of acute exacerbations of COPD (AECOPD): increased sputum volume or purulence and/or breathlessness, with or without symptoms (e.g. cough, wheeze, chest pain, malaise, fever).

**chronic pelvic pain (CPP)** intermittent or constant pain in the lower abdomen or pelvis of at least six months' duration, not occurring exclusively with menstruation or intercourse and not associated with pregnancy. It may be caused by an underlying gynaecological condition, such as **\*endometriosis** or adhesions, but bowel or bladder disorders (e.g. irritable bowel syndrome, interstitial cystitis), visceral hypersensitivity, and psychological conditions may all contribute.

**Chronic Sick and Disabled Persons Act 1970** (in Britain) an Act providing for the identification and care of those suffering from a chronic or degenerative disease for which there is no cure and which can be only partially alleviated by treatment. Such people are usually distinguished from

the elderly who may also suffer from chronic diseases. It is the responsibility of local authorities to identify those with such problems and to ensure that services are available to meet their needs. Identification can be difficult because of the lack of a clear and agreed definition of what constitutes a disability of such severity as to warrant inclusion in such a register.

**chronic total occlusion (CTO)** a complete arterial blockage (usually coronary) that has been present for at least three months. Fibrosis and calcification at the site of occlusion are well established by this time, making **\*percutaneous** coronary intervention to open the artery much more difficult.

**chrys-** (**chryso-**) *combining form denoting gold or gold salts.*

**chrysiasis** *n.* the deposition of gold in the eye and other tissues as a result of prolonged or excessive treatment with gold salts.

**Chrysops** *n.* a genus of bloodsucking flies, commonly called deer flies. Female flies, found in shady wooded areas, bite humans during the day. Certain species in Africa may transmit the tropical disease **\*loiasis** to humans. In the USA *C. discalis* is a vector of **\*tularaemia**.

**chrysotherapy** *n.* the treatment of disease by the administration of **\*gold** or its compounds.

**Churg–Strauss syndrome (eosinophilic granulomatosis with polyangiitis)** a systemic autoimmune **\*vasculitis** comprising severe asthma, allergic rhinitis, and sinusitis associated with an increased **\*eosinophil** count in the peripheral blood and eosinophilic deposits in the small vessels of the lungs. It usually responds to oral corticosteroids. [J. Churg (1910–2005) and L. Strauss (1913–85), US pathologists]

**Chvostek's sign** twitching of the facial muscles elicited by stimulation of the facial nerve by tapping. This indicates muscular irritability, usually due to calcium depletion (see **TETANY**). [F. Chvostek (1835–84), Austrian surgeon]

**chyle** *n.* an alkaline milky liquid found within the **\*lacteals** after a period of absorption. It consists of lymph with a suspension of minute droplets of digested fats (triglycerides), which have been absorbed from the small

intestine. It is transported in the lymphatic system to the **\*thoracic duct**. *See also ASCITES.*

**chylomicron** *n.* a **\*lipoprotein** particle present in the blood after digested fat has been absorbed from the small intestine. The lipid portion consists largely of triglycerides, which are released by the action of **\*lipoprotein lipase**.

**chyluria** *n.* the presence of **\*chyle** in the urine.

**chyme** *n.* the semiliquid acid mass that is the form in which food passes from the stomach to the small intestine. It is produced by the action of **\*gastric juice** and the churning movements of the stomach.

**chymotrypsin** *n.* a protein-digesting enzyme (*see* **PEPTIDASE**). It is secreted by the pancreas in an inactive form, **chymotrypsinogen**, that is converted into chymotrypsin in the duodenum by the action of **\*trypsin**.

**chymotrypsinogen** *n.* *see* **CHYMOTRYPSIN**.

**Cialis** *n.* *see* **SILDENAFIL**.

**cicatricial** *adj.* associated with scarring. For example, **cicatricial alopecia** is a type of baldness associated with scarring (*see* **ALOPECIA**).

**ciclosporin (cyclosporin)** *n.* an **\*immunosuppressant** drug used to prevent and treat rejection of a transplanted organ or bone marrow. It may also be used to treat severe rheumatoid arthritis, psoriasis, atopic eczema, and ulcerative colitis. Side-effects include nausea, gum swelling, tremor, excessive hair growth, and kidney impairment.

**-cide** *combining form denoting* killer or killing. Examples: **bactericide** (of bacteria); **infanticide** (of children).

**ciliary body** the part of the **\*eye** that connects the choroid with the iris. It consists of three zones: the **ciliary ring**, which adjoins the choroid; the **ciliary processes**, a series of about 70 radial ridges behind the iris to which the suspensory ligament of the lens is attached; and the **ciliary muscle**, contraction of which alters the curvature of the lens (*see* **ACCOMMODATION**).

**cilium** *n.* (*pl.* **cilia**) **1.** a hairlike process, large numbers of which are found on certain epithelial cells and on certain (ciliate) protozoa. Cilia are particularly characteristic of the epithelium that lines the upper respiratory tract, where their beating serves to remove particles of dust and other foreign material. **2.** an eyelash or eyelid. —**ciliary** *adj.*

**cimetidine** *n.* an H<sub>2</sub>-receptor antagonist (*see* **ANTI-HISTAMINE**) that reduces gastric acidity and is used to treat gastro-oesophageal reflux and peptic ulcers. Side-effects include rashes, dizziness, diarrhoea, and muscular pains.

**Cimex** *n.* *see* **BED BUG**.

**CIN** *see* **CERVICAL INTRAEPITHELIAL NEOPLASIA**.

**cinacalcet** *n.* a drug that mimics the action of calcium in the body by activating the calcium-sensing cell receptors and thus reduces the level of **\*parathyroid hormone**. It is used in the treatment of secondary **\*hyperparathyroidism** in advanced kidney failure and also for reducing the level of **\*hypercalcaemia** in parathyroid carcinoma. It is taken orally. Trade name: **Mimpara**.

**cinchocaine** *n.* a local anaesthetic used in combination with corticosteroids in ointments and suppositories to relieve the pain of haemorrhoids.

**cinchona** *n.* the dried bark of *Cinchona* trees, formerly used in medicine to stimulate the appetite and to prevent haemorrhage and diarrhoea. Taken over prolonged periods, it may cause **\*cinchonism**. Cinchona is the source of **\*quinine**.

**cinchonism** *n.* poisoning caused by an overdose of cinchona or the alkaloids quinine, quinidine, or cinchonine derived from it. The symptoms are commonly ringing noises in the ears, dizziness, blurring of vision (and sometimes complete blindness), rashes, fever, and low blood pressure. Treatment with **\*diuretics** increases the rate of excretion of the toxic compounds from the body.

**cine-** *combining form denoting* any technique of recording a rapid series of X-ray images on cine film for later analysis. Examples: **cineangiography**; **cinefluorography**. Cine film has been replaced by electronic storage (digital) media. *See also* **VIDEO-**.

**cingulectomy** *n.* surgical excision of the **\*cingulum**, the part of the brain concerned with anger and depression. The procedure has occasionally been carried out as **\*psychosurgery** for intractable mental illness, usually bilaterally. It is very rare in current psychiatric treatment.

**cingulum** *n.* (*pl.* **cingula**) **1.** a curved bundle of nerve fibres in each cerebral hemisphere, nearly encircling its connection with the corpus callosum. *See* **CEREBRUM**. **2.** a small protuberance on the lingual surface of the crowns of incisor and canine teeth.

**ciprofibrate** *n.* *see* **FIBRATES**.

**ciprofloxacin** *n.* a broad-spectrum **\*quinolone** antibiotic that can be given orally or by intravenous infusion and is particularly useful against Gram-negative bacteria, such as *Pseudomonas*, that are resistant to all other oral antibiotics. Side-effects can include nausea, diarrhoea, abdominal pain, and headache. It is also applied as eye drops or ointment for eye infections and corneal ulcers.

**circadian** *adj.* denoting a biological rhythm or cycle of approximately 24 hours. *Compare* **NYCTOHEMERAL**; **ULTRADIAN**.

**circle of Willis** a circle on the undersurface of the brain formed by linked branches of the arteries that supply the brain (see illustration). Most cerebral **\*aneurysms** occur on or near the circle of Willis. [T. Willis (1621–75), English anatomist]

The circle of Willis (seen from below).

**circulatory system** *see* [CARDIOVASCULAR SYSTEM](#).

**circum-** *prefix denoting* around; surrounding. Example: **circumanal** (surrounding the anus).

**circumcision** *n.* **1.** surgical removal of the foreskin of the penis. This operation is usually performed for religious and ethnic reasons but is sometimes required for medical conditions, mainly pathological *\*phimosis* due to *\*balanitis xerotica obliterans* and *\*paraphimosis*. **2.** (female **circumcision**) *see* [FEMALE GENITAL MUTILATION](#).

**circumduction** *n.* a circular movement, such as that made by a limb.

**circumflex nerve** a mixed sensory and motor nerve of the upper arm. It arises from the fifth and sixth cervical segments of the spinal cord and is distributed to the deltoid muscle of the shoulder and the overlying skin.

**circumoral** *adj.* situated around the mouth.

**circumstantiality** *n.* (in psychiatry) a symptom of thought disturbance in which thinking and speech proceed slowly and with many unnecessary trivial details. It is sometimes seen in organic *\*psychosis*, in *\*schizophrenia*, and in people of obsessional personality.

**cirrhosis** *n.* a condition in which the liver responds to liver cell (**\*hepatocyte**) injury or death by replacing damaged tissue with interlacing strands of fibrous tissue and nodules of regenerating cells. The liver becomes tawny and characteristically knobbly in appearance (due to the nodules). Causes include chronic **\*alcoholism** (**alcoholic cirrhosis**), viral **\*hepatitis**, **\*nonalcoholic fatty liver disease** (NAFLD), chronic obstruction of the common bile duct (**secondary biliary cirrhosis**), autoimmune diseases (**chronic autoimmune hepatitis**, **primary biliary cirrhosis**), sclerosing **\*cholangitis**, and chronic heart failure (**cardiac cirrhosis**). In a small minority of cases no cause is found (**cryptogenic cirrhosis**). Complications include **\*portal hypertension**, **\*ascites**, **\*hepatic encephalopathy**, and **\*hepatoma**. Cirrhosis is irreversible. The withdrawal or treatment of causative factors prevents further deterioration of liver function. Liver transplantation may be considered when liver failure has become established. Complete abstinence from alcohol should be recommended to those patients with cirrhosis secondary to alcoholic liver disease. — **cirrhotic** *adj.*

**cirs-** (**cirso-**) *combining form denoting a varicose vein.* Example: **cirsectomy** (excision of).

**cirroid** *adj.* describing the distended knotted appearance of a varicose vein. The term is used for a type of tumour of the scalp (**cirroid aneurysm**), which is an arteriovenous aneurysm.

**CIS** *see* **CARCINOMA IN SITU**.

**cisatracurium** *n. see* **MUSCLE RELAXANT**.

**CISC** clean intermittent self-catheterization. *See* **INTERMITTENT SELF-CATHETERIZATION**.

**cisplatin** *n.* a platinum-containing compound: a **\*cytotoxic drug** that impedes cell division by damaging DNA. Administered intravenously, it is used in the treatment of various cancers, including testicular tumours and cancers of the head and neck. Side-effects include nausea, vomiting, kidney damage, peripheral neuropathy, and hearing loss. Less toxic **\*analogues** of cisplatin are available (*see* **CARBOPLATIN**; **OXALIPLATIN**).

**cisterna** *n.* (*pl.* **cisternae**) **1.** one of the enlarged spaces beneath the **\*arachnoid** that act as reservoirs for cerebrospinal fluid. The largest (**cisterna magna**) lies beneath the cerebellum and behind the medulla oblongata. **2.** a dilatation at the lower end of the thoracic duct, into which the great lymph ducts of the lower limbs drain.

**cistron** *n.* the section of a DNA or RNA chain that controls the amino-acid sequence of a single polypeptide chain in protein synthesis. A cistron can be regarded as the functional equivalent of a **\*gene**.

**citalopram** *n.* an antidepressant drug that acts by prolonging the action of the neurotransmitter serotonin (5-hydroxytryptamine) in the brain (*see* **SSRI**). Side-effects may include dizziness, agitation, tremor, nausea, and diarrhoea.

**citric acid** an organic acid found naturally in citrus fruits. Citric acid is formed in the first stage of the **\*Krebs cycle**, the important energy-producing cycle in the body.

**citric acid cycle** *see* **KREBS CYCLE**.

**Citrobacter** *n.* a genus of Gram-negative anaerobic rod-shaped bacteria widely distributed in nature. The organisms cause infections of the intestinal and urinary tracts, gall bladder, and the meninges that are usually secondary, occurring in the elderly, newborn, debilitated, and immunocompromised.

**citrullinaemia** *n.* an inborn lack of one of the enzymes concerned with the chemical breakdown of proteins to urea: in consequence both the amino acid citrulline and ammonia accumulate in the blood. Affected children fail to thrive, and show signs of mental retardation.

**citrulline** *n.* an **\*amino acid** produced by the liver as a by-product during the conversion of ammonia to **\*urea**.

**CJD** *see* **CREUTZFELDT–JAKOB DISEASE**.

**clamp** *n.* a surgical instrument designed to compress a structure, such as a blood vessel or the intestine (*see* illustration). A variety of clamps have been designed for specific surgical procedures. **Blood-vessel (atraumatic) clamps** are used to stop bleeding from the cut vessels and are designed not to damage the arterial wall. **Intestinal clamps** prevent the intestinal contents

from leaking into the abdominal cavity during operations on the intestines and are designed either not to damage the intestinal wall (noncrushing clamps) or to close the open end (crushing clamps) prior to excising and suturing the intestine to create an anastomosis.

#### Intestinal clamps.

**Clark's levels** the five vertical levels of skin that are successively penetrated by an invading *\*melanoma*. They are: epidermis, papillary dermis, intervening zone, reticular dermis, and subcutaneous tissue. They usually correlate with the *\*Breslow thickness*. [W. H. Clark (1924–97), US dermatologist]

**clasp** *n.* (in dentistry) the part of a *\*denture* or *\*orthodontic appliance* responsible for its stabilization and retention. They are normally made of a cast or wrought metal, although more recently flexible acrylic clasps are also available.

**clasp-knife rigidity** *see* SPASTICITY.

**claudication** *n.* limping. **Intermittent claudication** is a cramping pain, induced by exercise and relieved by rest, that is caused by an inadequate supply of blood to the affected muscles. It is most often seen in the calf and leg muscles as a result of *\*atheroma* of the leg arteries. The leg pulses are often absent and the feet may be cold. The treatment is that of atheroma.

**claustrophobia** *n.* a morbid fear of enclosed places. *Compare* AGORAPHOBIA. *See also* PHOBIA.

**claustrum** *n.* a thin vertical layer of grey matter in each cerebral hemisphere, between the surface of the *\*insula* and the lenticular nucleus (see *BASAL GANGLIA*).

**clavicle** *n.* the collar bone: a long slender curved bone, a pair of which form the front part of the shoulder girdle. Each clavicle articulates laterally with the *\*scapula* and medially with the manubrium of the sternum (breastbone). Fracture of the clavicle is a common *\*sports injury*: the majority of cases require no treatment other than supporting the weight of the arm in a sling. — **clavicular** *adj.*

**clavulanic acid** a drug that interferes with the *\*penicillinases* that inactivate *\*beta-lactam antibiotics*, such as *\*amoxicillin* or *\*ticarcillin*. Combined with the antibiotic, clavulanic acid can overcome drug resistance.

**clavus** *n.* a sharp pain in the head, as if a nail were being driven in.

**claw-foot** *n.* an excessively arched foot, giving an unnaturally high instep. In most cases the cause is unknown, but the deformity may sometimes be due to an imbalance between the muscles flexing the toes and the shorter muscles that extend them; this type is found in some neuromuscular diseases, such as Friedreich's *\*ataxia*. Surgical treatment is effective in childhood but less so in adult life. Medical name: **pes cavus**.

**claw-hand** *n.* flexion and contraction of the fingers with extension at the joints between the fingers and the hand, giving a claw-like appearance. Any kind of damage to the nerves or muscles may lead to claw-hand; causes include injuries, *\*syringomyelia*, and leprosy. See also *DUPUYTREN'S CONTRACTURE*.

**clearance (renal clearance)** *n.* a quantitative measure of the rate at which waste products are removed from the blood by the kidneys or through the process of dialysis. It is expressed in terms of the volume of blood that could be completely cleared of a particular substance in a particular unit of time. Clearance by the kidney is usually measured as ml/min while clearance with, say, peritoneal dialysis is usually measured in litres/week.

**clear-cell carcinoma (clear-cell adenocarcinoma)** a variant of *\*adenocarcinoma* that tends to arise from the kidneys or the female genital

tract. In the latter case it is linked to intrauterine exposure to **\*diethylstilbestrol** during the 1950s and 1960s and takes the form of a vaginal cancer, which can be treated by radical surgery followed by radiotherapy.

**clearing** *n.* (in microscopy) the process of removing the cloudiness from microscopical specimens after **\*dehydration** by means of a **clearing agent**. This increases the transparency of the specimens. Xylene, cedar oil, methyl benzoate plus benzol, and methyl salicylate plus benzol are commonly used as clearing agents.

**cleavage** *n.* (in embryology) the process of repeated cell division of the fertilized egg to form a ball of cells that becomes the **\*blastocyst**. The cells (**blastomeres**) do not grow between divisions and so they decrease in size.

**cleft lip (harelip)** the congenital deformity of a cleft in the upper lip, on one or both sides of the midline. It occurs when the three blocks of embryonic tissue that go to form the upper lip fail to fuse and it is often associated with a **\*cleft palate**. Medical name: **cheiloschisis**.

**cleft palate** a fissure in the midline of the palate due to failure of the two sides to fuse in embryonic development. Only part of the palate may be affected, or the cleft may extend the full length with bilateral clefts at the front of the maxilla; it may be accompanied by a **\*cleft lip** and disturbance of tooth formation. Cleft palates can be corrected by surgery.

**cleid-** (**cleido-**, **clid-**, **clido-**) *combining form denoting* the clavicle (collar bone). Example: **cleidocranial** (of the clavicle and cranium).

**cleidocranial dysostosis** a congenital defect of bone formation in which the skull bones ossify imperfectly and the collar bones (clavicles) are absent.

**clemastine** *n.* an antihistamine used for the treatment of symptoms of hay fever and urticaria. Common side-effects are dizziness, sleepiness, and stomach upset.

**client-centred therapy (Rogerian therapy)** a method of psychotherapy in which the therapist refrains from directing clients in what they should do and instead concentrates on communicating understanding and acceptance.

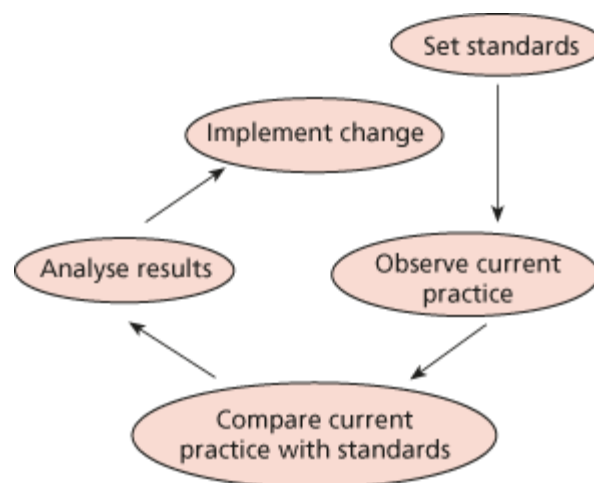

Frequently the therapist reflects the clients' own words or feelings back to them. The aim is to enable clients to solve their own problems.

**climacteric** *n.* **1.** *see* MENOPAUSE. **2. (male climacteric)** declining sexual drive and fertility in men, usually occurring around or after middle age. *See* ANDROPAUSE.

**clindamycin** *n.* an antibiotic used to treat serious bacterial infections, such as staphylococcal bone and joint infections. The most serious side-effect is pseudomembranous colitis, caused by overgrowth of *\*Clostridium difficile*, which limits the use of this drug; other side-effects include nausea, vomiting, and occasional hypersensitivity reactions.

**clinic** *n.* **1.** an establishment or department of a hospital devoted to the treatment of particular diseases or the medical care of out-patients. **2.** a gathering of instructors, students, and patients, usually in a hospital ward, for the examination and treatment of the patients.

**clinical audit** a quality-improvement process that seeks to improve patient care and outcomes through systematic review. Aspects of the structure, processes, and outcomes of care are selected and systematically evaluated against explicit criteria. Where indicated, changes are implemented at an individual, team, or service level and further monitoring is used to confirm improvement in health-care delivery. The assessment, evaluation, and improvement of quality then forms a cycle of activity (audit cycle) that promotes sustained improvement (see diagram).

**Clinical audit.** The audit cycle.

A distinction may be made between clinical audit, which refers to total care (involving doctors, nurses, paramedical staff, etc.), and **medical audit**, which refers to medical care specifically performed by doctors, although in practice the two terms are often used interchangeably.

**clinical commissioning groups (CCGs)** self-governing bodies set up by the Health and Social Care Act 2012, following the abolition of *\*primary care trusts* and *\*strategic health authorities*, to commission most NHS services in England. CCGs are formed of all GP practices within a given geographical area, and all GP practices must belong to a clinical commissioning group. All CCGs have their own constitution and governing body, which (in addition to GPs) must include at least one registered nurse and at least one secondary care specialist doctor. There are currently 195 CCGs in England.

**clinical ethics** consideration of the moral issues attendant upon, and questions arising from, clinical practice, as distinct from research. In North America, it is common for hospitals to employ a clinical ethicist or provide a formal clinical ethics consultation service. In the UK, clinical *\*ethics committees* are increasingly common in the NHS.

**Clinical Global Impression (CGI)** rating scales commonly used by clinicians to measure symptom severity and treatment response in treatment studies of patients with psychiatric illnesses. Many researchers consider them to be a good tool to measure the clinical utility or relevance of a given treatment. The Clinical Global Impression–Severity scale (**CGI-S**) is used to rate the severity of the patient’s symptoms relative to the clinician’s past experience with patients who have the same diagnosis. Scores range from 1 (normal) to 7 (extremely ill). The Clinical Global Impression–Improvement scale (**CGI-I**) measures change in the patient’s presentation from baseline. Scores range from 1 (very much improved) to 7 (very much worse). A score of 4 indicates no change.

**clinical governance** the framework through which the NHS aims to deliver high-quality services within a safe system, with continuous efforts for service improvement. Introduced in 1998, clinical governance emphasizes the concept of accountability: organizations, teams, and individuals should understand and accept their roles and responsibilities in delivering care. The range of activities undertaken under the banner of clinical governance

includes ensuring clinical effectiveness of treatments, *\*risk management*, *\*clinical audit*, *\*quality assurance*, patient and public involvement (in local *\*Healthwatch groups*), staff education, development, and training (*see APPRAISAL; REVALIDATION*), and research. There is a push in the NHS towards **integrated governance**: a cohesive approach to all governance arrangements (clinical, corporate, and financial) in organizations, with an emphasis on involving patients and external stakeholders in the development of future arrangements. *See also CARE QUALITY COMMISSION; INTEGRATED CARE PATHWAY; NICE; NATIONAL SERVICE FRAMEWORKS.*

**clinical medical officer** *see* **COMMUNITY HEALTH.**

**clinical medicine** the branch of medicine dealing with the study of actual patients and the diagnosis and treatment of disease at the bedside, as opposed to the study of disease by *\*pathology* or other laboratory work.

**clinical trial** *see* **INTERVENTION STUDY.**

**clinodactyly** *n.* congenital deflection of one or more digits from the central axis of the hand or foot. Clinodactyly may affect both hands (or feet) but most commonly affects the fifth finger (which curves towards the fourth). It has an incidence of 9% and may be found in isolation, in association with other congenital malformations, or it may occur as part of a syndrome (e.g. Down's syndrome). No treatment is necessary.

**clitoridectomy** *n.* the surgical removal of the clitoris (*see* **FEMALE GENITAL MUTILATION**).

**clitoris** *n.* the female counterpart of the penis, which contains erectile tissue (*see* **CORPUS CAVERNOSUM**) but is unconnected with the urethra. Like the penis it becomes erect under conditions of sexual stimulation, to which it is very sensitive.

**clitoromegaly** *n.* abnormal development of the clitoris due to excessive exposure to androgens, either from abnormal endogenous production or exogenous administration.

**clivus** *n.* (in anatomy) a surface that slopes, as in part of the sphenoid bone.

**CLO** *Campylobacter*-like organism: the original (now obsolete) term for *\*Helicobacter pylori*, still widely used as the commercial name for one of the mucosal urease biopsy test kits available (**CLO test**).

**cloaca** *n.* the most posterior part of the embryonic *\*hindgut*. It becomes divided into the rectum and the urinogenital sinus, which receives the bladder together with the urinary and genital ducts.

**clomethiazole (chlormethiazole)** *n.* a hypnotic and sedative drug used to treat severe insomnia, agitation, and restlessness in the elderly, and alcohol withdrawal symptoms. The most common side-effects are tingling sensations in the nose and sneezing.

**clomifene (clomiphene)** *n.* a synthetic nonsteroidal compound (see **ANTI-OESTROGEN**) that induces ovulation and subsequent menstruation in women who fail to ovulate (for example, due to polycystic ovary syndrome). Common side-effects are hot flushes and abdominal discomfort.

**clomipramine** *n.* a sedative tricyclic *\*antidepressant* taken by mouth to treat depressive illness, phobias, and obsessional states. Common side-effects are dry mouth and blurred vision.

**clonazepam** *n.* a benzodiazepine with *\*anticonvulsant* properties, used to treat epileptic seizures. Drowsiness is a common side-effect.

**clone** **1.** *n.* a group of cells (usually bacteria) descended from a single cell by asexual reproduction and therefore genetically identical to each other and to the parent cell. **2.** *n.* an organism derived from a single cell of its parent and therefore genetically identical to it. The first cloned animal, born in 1997, was produced by fusing a somatic nucleus of the parent with a denucleated egg cell of a second animal. The resulting ‘embryo’ was implanted into the uterus of a third animal to complete its development. **3.** *n.* (**gene clone**) a group of identical genes produced by *\*genetic engineering*. The parent gene is isolated using *\*restriction enzymes* and inserted, via a **cloning vector** (e.g. a bacteriophage), into a bacterium, in which it is replicated. See also **VECTOR**. **4.** *vb.* to form a clone. See also **CLONING**.

**clonic** *adj.* of, relating to, or resembling clonus. The term is most commonly used to describe the rhythmical limb movements seen as part of a generalized

tonic-clonic seizure (see [EPILEPSY](#)).

**clonidine** *n.* a drug that interacts with [\\*adrenoceptors](#) in the brain to reduce sympathetic stimulation of the arteries (see [CATECHOLAMINES](#); [NORADRENALINE](#)). It is occasionally used to treat high blood pressure. Common side-effects include drowsiness and dry mouth, and sudden withdrawal may worsen the hypertension.

In the **clonidine suppression test**, used in the diagnosis of [\\*phaeochromocytoma](#), clonidine is administered orally and plasma catecholamines sampled then and at hourly intervals for three hours. In normal subjects clonidine suppresses release of catecholamines and plasma levels are reduced, but in people with phaeochromocytoma plasma catecholamines remain elevated.

**cloning** *n.* the process of making identical copies ([\\*clones](#)) of genes, cells, or organisms. **Therapeutic cloning**, which is lawful if licensed by the Human Fertilisation and Embryology Authority, produces human blastocysts to harvest their [\\*stem cells](#). In **reproductive cloning**, whole animals are produced: see [CLONE](#) (sense 2); reproductive cloning of humans is unlawful in the UK. The moral issues relative to therapeutic and reproductive cloning are hotly debated, although for many it is the purpose of cloning that determines its moral acceptability or otherwise.

**clonogenic** *adj.* describing a cell capable of producing a colony of cells of a predetermined minimum size. Such a cell is known as a **colony forming unit (CFU)**.

**clonorchiasis** *n.* a condition caused by the presence of the fluke *Clonorchis sinensis* in the bile ducts. The infection, common in the Far East, is acquired through eating undercooked, salted, or pickled freshwater fish harbouring the larval stage of the parasite. Symptoms include fever, abdominal pain, diarrhoea, liver enlargement, loss of appetite, emaciation and – in advanced cases – cirrhosis and jaundice. Treatment is unsatisfactory although [\\*praziquantel](#) has proved beneficial in some cases.

**Clonorchis** *n.* a genus of liver flukes, common parasites of humans and other fish-eating mammals in the Far East. The adults of *C. sinensis* cause

clonorchiasis. Eggs are passed out in the stools and the larvae undergo their development in two other hosts, a snail and a fish.

**clonus** *n.* rhythmical contraction of a muscle in response to a suddenly applied and then sustained stretch stimulus. It is most readily obtained at the ankle when the examiner bends the foot sharply upwards and then maintains an upward pressure on the sole. It is caused by an exaggeration of the stretch reflexes and is usually a sign of disease in the brain or spinal cord.

**clopidogrel** *n.* an **\*antiplatelet drug** given to prevent strokes or heart attacks in those at risk. Side-effects may include gastrointestinal bleeding.

**Clostridium** *n.* a genus of mostly Gram-positive anaerobic spore-forming rodlike bacteria commonly found in soil and in the intestinal tract of humans and animals. Many species cause disease and produce extremely potent **\*exotoxins**. *C. botulinum* grows freely in badly preserved canned foods, producing a toxin causing serious food poisoning (**\*botulism**); an extremely dilute form of this toxin is now used to treat muscle spasm (see **BOTULINUM TOXIN**). *C. histolyticum*, *C. oedematiens*, and *C. septicum* all cause **\*gas gangrene** when they infect wounds. *C. tetani* lives as a harmless **\*commensal** in the intestine but causes **\*tetanus** on contamination of wounds (with manured soil). The species *C. perfringens* – Welch's bacillus – causes blood poisoning, **\*food poisoning**, and gas gangrene. Overgrowth of *Clostridium difficile* (often shortened to *C. diff*), a normal inhabitant of the human large intestine, is not uncommon as a complication of some antibiotic therapy and produces a specific condition – **pseudomembranous colitis** (see **PSEUDOMEMBRANE**) – which is life-threatening unless treated promptly and is becoming more common as a hospital-acquired infection.

**clotrimazole** *n.* an antifungal drug used to treat all types of fungal skin infections (including ringworm), infection in otitis externa, and vaginal candidiasis (thrush). It is applied to the infected part and occasionally causes mild burning or irritation.

**clotting factors** see **COAGULATION FACTORS**.

**clotting time** see **COAGULATION TIME**.

**clozapine** *n.* an atypical **\*antipsychotic** drug used in the treatment of schizophrenia in patients who are unresponsive to conventional antipsychotics. Side-effects include dizziness, headache, and increased salivation, and in a few cases the drug may depress levels of white blood cells.

**CLS** *see* **COFFIN–LOWRY SYNDROME**.

**clubbing** *n.* thickening of the tissues at the bases of the finger and toe nails so that the normal angle between the nail and the digit is filled in. The nail becomes convex in all directions and in extreme cases the digit end becomes bulbous like a club or drumstick. Clubbing is seen in pulmonary tuberculosis, bronchiectasis, empyema, infective endocarditis, cyanotic congenital heart disease, lung cancer, and cirrhosis and as a harmless congenital abnormality.

**club-foot (talipes)** *n.* a congenital deformity of one or both feet in which the patient cannot stand with the sole of the foot flat on the ground. In the most common variety (**congenital talipes equinovarus**) the foot points downwards, the heel is inverted, and the forefoot twisted. It is diagnosed at birth and may be associated with other congenital abnormalities. Treatment is initially by physiotherapy and strapping or a plaster cast, but if this fails to correct the deformity surgical correction is performed. Other varieties are **talipes varus**, inward deviation of the hind foot; and **talipes valgus**, an outward deviation of the hind foot, which is much less common.

**clumping** *n. see* **AGGLUTINATION**.

**cluster headache** a variant of **\*migraine** more common in men than in women (ratio 9:1). The unilateral pain around one eye is very severe and lasts between 15 minutes and 3 hours. The attacks commonly occur in the early hours of the morning but may occur up to eight times a day. The pain is associated with drooping of the eyelid (**\*ptosis**), a bloodshot eye, a small pupil, and/or excessive production of tears in the eye. The acute treatment is with high-flow inhaled oxygen in conjunction with antimigraine drugs (5HT<sub>1</sub> agonists) and prophylaxis is with such drugs as verapamil, lithium, or methysergide.

**Clutton's joint** a painless joint effusion in a child, usually in the knee, caused by inflammation of the synovial membranes due to congenital

syphilis. [H. H. Clutton (1850–1909), British surgeon]

**clyster** *n.* an old-fashioned term for an *\*enema*.

**CMO** *see* **CHIEF MEDICAL OFFICER**.

**CMV** *see* **CYTOMEGALOVIRUS**.

**CNS** *see* **CENTRAL NERVOUS SYSTEM**.

**coagulant** *n.* any substance capable of converting blood from a liquid to a solid state. *See* **BLOOD COAGULATION**.

**coagulase** *n.* an enzyme, formed by disease-producing varieties of certain bacteria of the genus *Staphylococcus*, that causes blood plasma to coagulate. Staphylococci that are positive when tested for coagulase production are classified as belonging to the species *Staphylococcus aureus*.

**coagulation** *n.* the process by which a colloidal liquid changes to a jelly-like mass. *See* **BLOOD COAGULATION**.

**coagulation factors (clotting factors)** a group of substances present in blood plasma that, under certain circumstances, undergo a series of chemical reactions leading to the conversion of blood from a liquid to a solid state (*see* **BLOOD COAGULATION**). Although they have specific names, most coagulation factors are referred to by an agreed set of Roman numerals (e.g. *\*Factor VIII*, *\*Factor IX*). Lack of any of these factors in the blood results in the inability of the blood to clot. *See also* **HAEMOPHILIA**.

**coagulation time (clotting time)** the time taken for blood or blood plasma to coagulate (*see* **BLOOD COAGULATION**). When measured under controlled conditions and using appropriate techniques, coagulation times may be used to test the function of the various stages of the blood coagulation process.

**coagulum** *n.* a mass of coagulated matter, such as that formed when blood clots.

**coalesce** *vb.* to grow together or unite. —**coalescence** *n.*

**coal tar** a complex mixture of hydrocarbons obtained from the distillation of coal. It has anti-inflammatory and antiscaling activity and is used in the

treatment of psoriasis, eczema, and dandruff. Side-effects may include local irritation and photosensitivity.

**coal-worker's pneumoconiosis** a lung disease caused by coal dust. It affects mainly coal miners but also other exposed workers, such as lightermen, if the lungs' capacity to accommodate and remove the particles is exceeded. *See* PNEUMOCONIOSIS.

**co-amoxiclav** *see* BETA-LACTAM ANTIBIOTIC.

**coarctation** *n.* (of the aorta) a congenital narrowing of a short segment of the aorta. The most common site of coarctation is just beyond the origin of the left subclavian artery from the aorta. This results in high blood pressure (**\*hypertension**) in the upper part of the body and arms and low blood pressure in the legs. The defect is corrected by surgery or **\*stent** implantation.

**Coats' disease** a congenital anomaly of the blood vessels of the retina, which are abnormally dilated and leaking. This results in subretinal haemorrhage and exudative **\*retinal detachment**. [G. Coats (1876–1915), British ophthalmologist]

**cobalamin** *n.* *see* VITAMIN B<sub>12</sub>.

**cobalt** *n.* a metallic element. The artificial radioisotope **cobalt-60**, or **radiocobalt**, is a powerful emitter of gamma radiation and is used in the radiation treatment of cancer (*see* RADIOOTHERAPY; TELETHERAPY). Cobalt itself forms part of the **\*vitamin B<sub>12</sub>** molecule. Symbol: Co.

**cobalt-chromium (cobalt-chrome)** *n.* a silver-coloured nonprecious alloy of cobalt and chromium used for the metal frame of partial **\*dentures** owing to its very high specific strength.

**coblation** *n.* a technique that uses high-frequency electric current passed through saline to generate relatively low levels of heat that can simultaneously cut through tissue and coagulate bleeding vessels by means of a device called a **coblator**. The technique can be used for several operations, most notably **\*tonsillectomy**.

**cocaine** *n.* an alkaloid that is derived from the leaves of the coca plant (*Erythroxylon coca*) or prepared synthetically and was formerly used as a local anaesthetic in ear, nose, and throat surgery. Since it causes feelings of exhilaration and may lead to psychological **\*dependence**, cocaine has been replaced by safer anaesthetics.

**coccidioidomycosis** *n.* an infection caused by inhaling the spores of the fungus *Coccidioides immitis*. In 60% of patients infection produces no symptoms at all. In the primary form there is an influenza-like illness that usually resolves within about eight weeks. In a few patients the disease becomes progressive and resembles tuberculosis. Severe or progressive infections are treated with intravenous injections of amphotericin. The disease is endemic in the desert areas of the Americas, especially the southwestern United States, northern Mexico, and northern Argentina.

**coccobacillus** *n.* a rod-shaped bacterium (bacillus) that is so small that it resembles a spherical bacterium (coccus). Examples of such bacteria are **\*Bacteroides** and **\*Brucella**.

**coccus** *n.* (*pl.* **cocci**) any spherical bacterium. *See also* **GONOCOCCUS**; **MENINGOCOCCUS**; **MICROCOCCUS**; **PNEUMOCOCCUS**; **STAPHYLOCOCCUS**; **STREPTOCOCCUS**.

**coccy-** (**coccyg-**, **coccygo-**) *combining form denoting the coccyx.* Example: **coccygectomy** (excision of).

**coccygodynia** (**coccydynia**) *n.* pain in the lowermost segment of the spine (coccyx) and the neighbouring area, usually as a result of trauma.

**coccyx** *n.* (*pl.* **coccyges** or **coccyxes**) the lowermost element of the **\*backbone**: the vestigial human tail. It consists of four rudimentary **coccygeal vertebrae** fused to form a triangular bone that articulates with the sacrum. *See also* **VERTEBRA**. —**coccygeal** *adj.*

**cochlea** *n.* the spiral organ of the **\*labyrinth** of the ear, which is concerned with the reception and analysis of sound. As vibrations pass from the middle ear through the cochlea, different frequencies cause particular regions of the basilar membrane to vibrate: high notes cause vibration in the region nearest the middle ear; low notes cause vibration in the region nearest the tip of the

spiral. The **organ of Corti**, which lies within a central triangular membrane-bound canal (**scala media** or **cochlear duct**), contains sensory hair cells attached to an overlying **tectorial membrane** (see illustration). When the basilar membrane vibrates the sensory cells become distorted and send nerve impulses to the brain via the **\*cochlear nerve**. —**cochlear** *adj.*

**Cochlea.** Section through a turn of the cochlea.

**cochlear duct (scala media)** *see* COCHLEA.

**cochlear implant** a device to improve the hearing of profoundly deaf people who derive no benefit from conventional **\*hearing aids**. It consists of an electrode that is permanently implanted into the inner ear (**\*cochlea**). An external device with a microphone and an electronic processing unit passes information to the electrode using radio-frequency waves. The implant is powered by batteries in the external part of the device.

**cochlear microphonic** the electrical potential generated by the cochlea in response to an acoustic stimulus. It can be detected by **\*auditory** brainstem response audiometry or **\*electrocochleography** and is useful in the diagnosis of **\*auditory** neuropathy spectrum disorder.

**cochlear nerve (acoustic nerve, auditory nerve)** the nerve connecting the cochlea to the brain and therefore responsible for transmitting the nerve impulses relating to hearing. It forms part of the **\*vestibulocochlear nerve** (cranial nerve VIII).

**Cockayne's syndrome** a hereditary disorder (inherited as an autosomal **\*recessive** condition) associated with **\*trisomy** of chromosome no. 20. Clinical features include **\*epidermolysis bullosa**, dwarfism, learning disabilities, and pigmentary degeneration of the retina. [E. A. Cockayne (1880–1956), British physician]

**Cockcroft-Gault formula** a formula for calculating the **\*glomerular filtration rate** based on the patient's age, body mass, and plasma creatinine level. A correction factor can be used to differentiate males from females.

**co-codamol** *n. see* **CODEINE**.

**codeine** *n.* an opioid analgesic derived from **\*morphine** but less potent as a pain killer and sedative and less toxic. It is also used to suppress dry coughs and treat diarrhoea. Common side-effects include constipation, nausea, vomiting, dizziness, and drowsiness, but **\*dependence** is uncommon. Codeine may also be administered orally in combination with paracetamol (as **co-codamol**) or aspirin (as **co-codaprin**) for pain relief.

**Codman's triangle** a triangular area of new bone seen on X-ray at the edge of a malignant bone tumour resulting from elevation of the **\*periosteum** by malignant tissue. It is most often seen in **\*osteosarcomas**. [E. A. Codman (1869–1940), US surgeon]

**codon** *n.* the unit of the **\*genetic code** that determines the synthesis of one particular amino acid. Each codon consists of a section of the DNA molecule, and the order of the codons along the molecule determines the order of amino acids in each protein made in the cell.

**co-dydramol** *n. see* **DIHYDROCODEINE**.

**-coele** *combining form denoting* **1.** a body cavity. Example: **blastocoele** (cavity of blastocyst). **2. see** **-CELE**.

**coeli- (coelio-)** *combining form denoting the abdomen or belly. Example: coeliectasia* (abnormal distension of).

**coeliac** *adj.* of or relating to the abdominal region. The **coeliac axis** (or **trunk**) is a branch of the abdominal **\*aorta** supplying the stomach, spleen, liver, and gall bladder.

**coeliac disease** a condition in which the small intestine fails to digest and absorb food. Affecting 1–2% of the population worldwide, it is due to a permanent sensitivity of the intestinal lining to the protein gliadin, which is contained in **\*gluten** in the germ of wheat and rye and causes atrophy of the digestive and absorptive cells of the intestine. Symptoms include stunted growth, distended abdomen, and pale frothy foul-smelling stools; the disease can be diagnosed by **\*biopsy** of the jejunum and is treated successfully by a strict and lifelong gluten-free diet. Medical name: **gluten-sensitive enteropathy**.

<https://www.coeliac.org.uk/home/>

- Website of Coeliac UK: provides information on coeliac disease and gluten-free living

**coelioscopy** *n.* the technique of introducing an **\*endoscope** through an incision in the abdominal wall to examine the intestines and other organs within the abdominal cavity.

**coelom** *n.* the cavity in an embryo between the two layers of mesoderm. It develops into the body cavity.

**coenzyme** *n.* a nonprotein organic compound that, in the presence of an **\*enzyme**, plays an essential role in the reaction that is catalysed by the enzyme. Coenzymes, which frequently contain the B vitamins in their molecular structure, include **\*coenzyme A**, **\*FAD**, and **\*NAD**.

**coenzyme A** a **\*nucleotide** containing pantothenic acid, which is an important coenzyme in the Krebs cycle and in the metabolism of fatty acids.

**cofactor** *n.* a nonprotein substance that must be present in suitable amounts before certain **\*enzymes** can act. Cofactors include **\*coenzymes** and metal

ions (e.g. sodium and potassium ions).

**coffee-ground vomit** vomit that has the appearance of ground coffee. It is composed of denatured oxidized blood and reflects bleeding in the upper gastrointestinal tract.

**Coffin–Lowry syndrome (CLS)** an inherited disease, more severe in males, that results in developmental delay and profound learning disability. It is characterized by distinctive facial anomalies, short stature, microcephaly, and **\*kyphoscoliosis**; some patients have episodes of collapse when startled or excited (**stimulus-induced drop episodes; SIDE**). [G. S. Coffin (1923– ), US paediatrician; R. B. Lowry (1932– ), British geneticist]

**Cogan's syndrome** a disorder in which **\*keratitis** and iridocyclitis (*see* **UVEITIS**) are associated with tinnitus, vertigo, and bilateral sensorineural deafness. [D. G. Cogan (1908–93), US ophthalmologist]

**cognition** *n.* the mental processes by which knowledge is acquired. These include perception, reasoning, acts of creativity, problem-solving, and possibly intuition. —**cognitive** *adj.*

**cognitive behavioural therapy (CBT)** a **\*cognitive therapy** that is combined with behavioural elements (*see* **BEHAVIOUR THERAPY**). The patient is encouraged to analyse his or her specific ways of thinking around a problem. The therapist then looks at the resulting behaviour and the consequences of that thinking and tries to encourage the patient to change his or her cognition in order to avoid adverse behaviour or its consequences. CBT is successfully used to treat phobias, anxiety, and depression (it is among the recommended treatments for anxiety and depression in the NICE guidelines).

**cognitive psychology** the branch of psychology concerned with all human activities relating to knowledge. More specifically, cognitive psychology is concerned with how knowledge is acquired, stored, correlated, and retrieved, by studying the mental processes underlying attention, concept formation, information processing, memory, and speech. Cognitive psychology views the brain as an information-processing system operating on, and storing, the data acquired by the senses. It investigates this function by experiments designed to measure and analyse human performance in carrying out a wide range of mental tasks. The data obtained allows possible

models of the underlying mental processes to be constructed. These models do not purport to represent the actual physiological activity of the brain. Nevertheless, as they are refined by testing and criticism, it is hoped that they may approach close to reality and gradually lead to a clearer understanding of how the brain operates.

**cognitive therapy** a form of *\*psychotherapy* based on the belief that psychological problems are the products of faulty ways of thinking about the world. For example, a depressed patient may use wrongly negative automatic associations in everyday situations. The therapist assists the patient to identify these false ways of thinking and to avoid them. In *\*cognitive behavioural therapy* this is combined with an analysis and retraining of unhelpful behaviours. In **cognitive analytical therapy** (CAT) there is an element of psychodynamic exploration of the patient's problems; CAT is mostly used to treat personality disorders.

**cohort study** a *\*longitudinal* study of a group of people defined by some common characteristic (typically age). It may be conducted prospectively or retrospectively. A **prospective cohort study** involves a systematic follow-up for a defined period of time or until the occurrence of a specified event (e.g. onset of illness, retirement, or death) in order to observe patterns of disease and/or cause of death. A **retrospective cohort study** examines data relating to the group's history of exposure and disease experience.

**coiling** *n.* (in interventional radiology) a technique in which metallic coils are placed inside a blood vessel to occlude it or divert the blood away from an *\*aneurysm*. In the case of acute bleeding, blocking the blood with coils is life-saving. In brain aneurysms, the bulging portion of the blood vessel is weak and can rupture, causing bleeding into the brain. By coiling the aneurysm the blood is diverted away from the weak portion. This has largely replaced aneurysm clipping by neurosurgeons, which involves opening the skull to gain access to the aneurysm.

**coinsurance** *n.* a form of private medical insurance policy in which the patient or other beneficiary shares the costs of treatment for injury or disease with the insurance company. Coinsurance policies are very common in the USA.

**coitus (sexual intercourse, copulation)** *n.* sexual contact between a man and a woman during which the erect penis enters the vagina and is moved within it by pelvic thrusts until **\*ejaculation** occurs. *See also* **ORGASM**. —**coital** *adj.*

**coitus interruptus** a contraceptive method in which the penis is removed from the vagina before ejaculation of semen (orgasm). The method is unreliable (10–20 pregnancies per 100 woman-years) and it may lead to sexual disharmony and anxiety in one or both partners.

**col- (coli-, colo-)** *combining form denoting the colon.* Example: **coloptosis** (prolapse of).

**colchicine** *n.* a drug obtained from the meadow saffron (*Colchicum autumnale*), used to relieve pain in attacks of gout and in the prevention of attacks of gout and hereditary **\*polyserositis**. Common side-effects are nausea, vomiting, diarrhoea, and stomach pains.

**cold (common cold)** *n.* a widespread infectious virus disease causing inflammation of the mucous membranes of the nose, throat, and bronchial tubes. The disease is transmitted by coughing and sneezing. Symptoms commence 1–2 days after infection and include a sore throat, stuffy or runny nose, headache, cough, and general malaise. The disease is mild and lasts only about a week but it can prove serious to young babies and to patients with a pre-existing respiratory complaint.

**cold coagulation** *see* **CERVICAL INTRAEPITHELIAL NEOPLASIA**.

**cold sore** *see* **HERPES**.

**colectomy** *n.* surgical removal of the colon. **Total colectomy** is removal of the whole colon, usually for extensive **\*colitis**; **partial colectomy** is removal of a segment of the colon. *See also* **HEMICOLECTOMY**; **PROCTOCOLECTOMY**.

**colestipol** *n.* a **\*bile-acid sequestrant** used, in conjunction with dietary reduction of cholesterol, to lower cholesterol levels in the blood in patients with hyperlipidaemia and primary hypercholesterolaemia that have not responded to diet. Constipation is a common side-effect.

**colestyramine (cholestyramine)** *n.* a drug that binds with bile salts so that they are excreted (see **BILE-ACID SEQUESTRANT**). It is used to relieve conditions due to irritant effects of bile salts (such as the itching that occurs in obstructive jaundice), to treat diarrhoea, and to lower the blood levels of cholesterol and other fats in patients with hyperlipidaemia. Common side-effects include constipation, heartburn, and nausea.

**colic** *n.* paroxysms of abdominal pain, usually of fluctuating severity. **Infantile colic** is common among babies, due to wind in the intestine associated with feeding difficulties. **Intestinal colic** is due to partial or complete obstruction of the intestine or to constipation. Medical name: **enteralgia**. **Renal colic** is excruciating pain caused by dilatation and spasm of the ureter when stones are present in the kidney, renal pelvis, or ureter. See also **BILIARY COLIC**.

**coliform bacteria** a group of Gram-negative rodlike bacteria that are normally found in the gastrointestinal tract and have the ability to ferment the sugar lactose. The group includes the genera *Enterobacter*, *\*Escherichia*, and *\*Klebsiella*.

**colistimethate sodium (colistin)** an antibiotic given to treat Gram-negative infections resistant to other antimicrobials and by inhalation to treat pseudomonal infection in patients with cystic fibrosis. Colistin is a mixture of antimicrobial substances produced by a strain of the bacterium *Bacillus polymyxa*. Its most serious side-effects are nerve and kidney damage.

**colitis** *n.* inflammation of the colon due to infection, inflammation, or ischaemia. It is diagnosed by clinical assessment combined with radiological imaging, stool cultures, and endoscopic evaluation. **Infectious colitis** may be due to viruses, bacteria, or protozoans (for example, *\*Entamoeba histolytica* causes **amoebic colitis**: see **DYSENTERY**). **Inflammatory colitis** encompasses *\*Crohn's disease (Crohn's colitis)*, *\*ulcerative colitis*, and **microscopic colitis**. Microscopic colitis can only be seen under a microscope (at endoscopy the colon appears normal). Symptoms of inflammatory colitis may include diarrhoea, abdominal pain, and the passage of blood and mucus in the stools. **Ischaemic colitis** occurs when there is partial or complete cessation of the blood supply to a particular region of the colon.

**collagen** *n.* a protein that is the principal constituent of white fibrous connective tissue (as occurs in tendons). Collagen is also found in skin, bone, cartilage, and ligaments. It is relatively inelastic but has a high tensile strength.

**collagen disease** an obsolete term for *\*connective-tissue disease*.

**collapsing pulse** *see* CORRIGAN'S PULSE.

**collar bone** *see* CLAVICLE.

**collateral** **1.** *adj.* accessory or secondary. **2.** *n.* a branch (e.g. of a nerve fibre) that is at right angles to the main part.

**collateral circulation** **1.** an alternative route provided for the blood by secondary vessels when a primary vessel becomes blocked. **2.** the channels of communication between the blood vessels supplying the heart. At the apex of the heart, where the coronary arteries form *\*anastomoses*, these are very complex.

**collective unconscious** (in Jungian psychology) structures of the unconscious mind shared by all humans. Jung considered the collective unconscious to exist collectively amongst humans in addition to the personal unconscious mind postulated by Freud. He argued that the collective unconscious, populated by instincts and *\*archetypes*, had a profound influence on the lives of individuals through symbols, rituals, and shared narratives.

**Colles' fracture** a fracture of the distal end of the *\*radius*, which is displaced backwards and upwards to produce a 'dinner fork' deformity. *\*Avulsion* of the ulnar styloid process (*see* ULNA) usually takes place as well. It is usually caused by a fall on the outstretched hand. The bone is restored to its normal position under anaesthesia, and a plaster cast is applied for about six weeks. Complications are residual deformity and stiffness of the wrist. If the fall occurs from less than standing height, it is considered an insufficiency fracture and its presence, in the absence of any other underlying cause, suggests *\*osteoporosis*. Early evaluation and treatment for osteoporosis is needed to prevent future fractures. Colles' fractures are more common in women immediately after menopause. [A. Colles (1773–1843), Irish surgeon]

**colliculus** *n.* (*pl.* **colliculi**) a small protuberance or swelling. Two pairs of colliculi, the **superior** and **inferior colliculi**, protrude from the roof of the midbrain (*see* **TECTUM**).

**collimator** *n.* a device, used in diagnostic radiology or radiotherapy, to produce a narrow beam of radiation by means of metallic sheets, acting like a diaphragm in a camera, that control the size of the beam from a radiation source. Many newer **\*linear accelerators** use **multi-leaf collimators**, a specialized form of collimator using individual 'leaves' (1 cm or smaller) to shape the radiation **\*treatment field** around the tumour. Collimators are also used on radiation detectors, in particular in **\*gamma cameras**, for which the exact source of radioactivity needs to be known to produce an accurate image.

**collodion** *n.* a syrupy solution of nitrocellulose in a mixture of alcohol and ether. When applied to the surface of the body it evaporates to leave a thin clear transparent skin, useful for the protection of minor wounds. Flexible collodion also contains camphor and castor oil, which allow the skin to stretch a little more.

**colloidian baby** the distinctive appearance of a newborn baby that is covered in a shiny membrane, resembling plastic wrap. This is usually the presentation of an underlying chronic skin disorders such as **\*ichthyosis**, although about 10% of colloidian babies have normal underlying skin.

**collyrium** *n.* a medicated solution used to bathe the eyes.

**coloboma** *n.* a defect in the development of the eye causing abnormalities ranging in severity from a notch in the lower part of the iris, making the pupil pear-shaped, to defects in the retina, choroid, and optic nerve **\*fundus**. A coloboma of the eyelid is a congenital notch in the lid margin.

**colography (colonography)** *n.* imaging of the colon. **CT colography** uses **\*computerized tomography** to obtain multiple **\*axial** thin-slice images (usually less than 3 mm thick), which can be electronically reformatted in two or three dimensions (*see* **MULTIPLANAR RECONSTRUCTION**). It has the added advantage of visualizing all the other abdominal organs. Although less invasive than **\*colonoscopy**, it cannot be used for biopsies or therapeutic procedures. **MR colography**, using **\*magnetic resonance imaging**, is

becoming more commonplace; its advantage over CT colography is that the patient is not exposed to irradiation.

**colon** *n.* the main part of the large intestine, which consists of four sections – the **ascending**, **transverse**, **descending**, and **sigmoid colons** (see illustration). The colon has no digestive function but it absorbs large amounts of water and electrolytes from the undigested food passed on from the small intestine. At intervals strong peristaltic movements move the dehydrated contents (faeces) towards the rectum. —**colonic** *adj.*

**The colon.**

**colonic irrigation** washing out the contents of the large bowel by means of copious enemas, using either water, with or without soap, or a liquid medication.

**colonography** *n.* *see* **COLOGRAPHY**.

**colonoscopy** *n.* an invasive endoscopic procedure for examining the interior of the colon and the terminal ileum. A **colonoscope** is a flexible, steerable telescopic instrument that houses a high-definition digital video camera to

allow direct visualization of the colonic mucosa. It is inserted into the anus and guided around the loops of the large bowel to the caecum and terminal ileum. Its progress may be aided by using an external **\*3-D magnetic imager** (e.g. ScopeGuide). It is possible to obtain biopsies for microscopic examination using flexible forceps passed through the colonoscope (**diagnostic colonoscopy**) and to remove polyps, dilate strictures with endoscopic balloons, or insert self-expandable metal stents (SEMS) into benign or malignant strictures (**therapeutic colonoscopy**).

**colony** *n.* a discrete population or mass of microorganisms, usually bacteria, all of which are considered to have developed from a single parent cell. Bacterial colonies that grow on agar plates differ in shape, size, colour, elevation, translucency, and surface texture, depending on the species. This is used as a means of identification. *See also* **CULTURE**.

**colony-stimulating factor (CSF)** one of a group of substances (haemopoietic growth factors or hormones) that are produced in the bone marrow and stimulate the production of specific blood cells. Genetically engineered granulocyte colony-stimulating factor (G-CSF) stimulates neutrophil production and also limits bone marrow toxicity from chemotherapy.

**colorectal cancer** malignancy of the large intestine (i.e. the colon, appendix, and rectum). It is the fourth most common cause of death from cancer: one million people are diagnosed each year. Most cases should be preventable by screening and surveillance protocols (including the **\*faecal occult blood test**) and modifiable lifestyle factors. Risk factors include older age, increased consumption of red meat and fatty foods, excessive alcohol intake, smoking, and sedentary lifestyle. Clinical symptoms include change in bowel habit, rectal bleeding, loss of appetite and weight, anaemia, and gastrointestinal obstruction. Diagnosis is made following analysis of samples taken during **\*colonoscopy**. CT scanning of the chest, abdomen, and pelvis defines the extent of the disease; MRI and PET scanning may yield additional radiological information. These findings are assessed using the **\*TNM classification**. Early localized disease is amenable to surgery, preoperative chemoradiation, and postoperative chemotherapy; advanced disease with metastases necessitates a palliative approach.

**colorimeter** *n.* an instrument for determining the concentration of a particular compound in a preparation by comparing the intensity of colour in it with that

in a standard preparation of known concentration. The instrument is used particularly for measuring the amount of haemoglobin in the blood.

**colostomy** *n.* a surgical operation in which a part of the colon is brought through the anterior abdominal wall and an artificial opening is created in order to drain or decompress the contents of colon. The part of the colon chosen depends on the site of obstruction or the underlying disease process. Depending on the indication a colostomy may be temporary, eventually being closed after months or years to restore intestinal continuity; or permanent, when the colon distal to the colostomy has been removed or is diseased. A bag is worn over the colostomy opening (**\*stoma**) to collect the faeces for disposal.

<http://www.colostomyuk.org/>

- Website of the Colostomy Association

**colostrum** *n.* the first secretion from the breast, occurring shortly after, or sometimes before, birth prior to the secretion of true milk. It is a relatively clear fluid containing serum, white blood cells, and protective antibodies.

**colour blindness** any of various conditions in which certain colours are confused with one another. True lack of colour appreciation is extremely rare (see **MONOCHROMAT**), but some defect of colour discrimination is present in about 8% of Caucasian males, and 0.4% of Caucasian females. The most common type of colour blindness is **Daltonism (protanopia)** – red-blindness – in which the person cannot distinguish between reds and greens. Occasional cases are due to acquired disease of the retina but in the vast majority it is inherited. The defect is thought to be in the functioning of the light-sensitive cells in the retina responsible for colour perception (see **CONE**). See also **DEUTERANOPIA**; **TRICHROMATIC**.

**colour flow ultrasound imaging** see **DOPPLER ULTRASOUND**.

**colp- (colpo-)** *combining form denoting the vagina.* Example: **colpoplasty** (plastic surgery of).

**colpoperineorrhaphy** *n.* an operation to repair tears in the vagina and the muscles surrounding its opening.

**colporrhaphy** *n.* an operation designed to remove lax and redundant vaginal tissue and so reduce the diameter of the vagina in cases of prolapse of the base of the bladder (**anterior colporrhaphy**; *see* CYSTOCELE) or of the rectum (**posterior colporrhaphy**; *see* RECTOCELE).

**colposcopy** *n.* examination of the cervix under low-power binocular magnification and an intense light source. If abnormalities are revealed (identified as white areas after application of acetic acid, then iodine, to the cervix), a diagnostic biopsy is taken for histological assessment. Confirmation of the diagnosis is followed by appropriate treatment (*see* CERVICAL INTRAEPITHELIAL NEOPLASIA). —**colposcopic** *adj.*

**colposuspension** *n.* a surgical procedure for treating stress incontinence in women in which the upper part of the vaginal wall is fixed to the anterior abdominal wall by unabsorbable suture material. It may be performed through an abdominal incision (**Burch colposuspension**) or using a laparoscope (**laparoscopic colposuspension**). These techniques have now been largely replaced by other less invasive sling procedures, such as \***tension-free vaginal tape**.

**columella** *n.* (in anatomy) a part resembling a small column. For example, the **columella cochleae (modiolus)** is the central pillar of the cochlea, around which the spiral cochlear canal winds. The **columella nasi** is the anterior part of the nasal septum.

**column** *n.* (in anatomy) any pillar-shaped structure, especially any of the tracts of grey matter found in the spinal cord.

**COM** chronic otitis media (*see* OTITIS).

**coma** *n.* **1.** a state of unrousable unconsciousness. *See also* GLASGOW COMA SCALE. **2.** (in optics) an \***aberration**, inherent in certain optical designs or due to imperfection in the lens or cornea, that results in off-axis point sources (e.g. stars) appearing to have a tail, like the coma of a comet. —**comatic** *adj.*

**co-magaldrox** *n.* *see* ALUMINIUM HYDROXIDE.

**combined therapy** therapy that combines several types of treatment in order to improve results. It is usually a combination of surgery with radiotherapy and/or chemotherapy for the treatment of malignant tumours (see [ADJUVANT THERAPY](#)). *See also* [SANDWICH THERAPY](#).

**Combitube** *n.* trade name for an airway support device, initially designed for use by relatively untrained personnel on the battlefield, that is referred to in modern hospital resuscitation guidelines but rarely used. The device has two tubes and is introduced through the mouth blindly into the back of the throat. It may end up in either the oesophagus or the airway: ventilation is provided either through the hole in the end of the tracheal tube or via perforations in the side of the oesophageal tube.

**comedo** *n.* (*pl.* **comedones**) *see* [BLACKHEAD](#).

**commando operation** a major operation performed to remove a malignant tumour from the head and neck. Extensive dissection, often involving the face, is followed by reconstruction to restore function and cosmetic acceptability.

**commensal** *n.* an organism that lives in close association with another of a different species without either harming or benefiting it. For example, some microorganisms living in the gut obtain both food and a suitable habitat but neither harm nor benefit humans. *Compare* [SYMBIOSIS](#). — **commensalism** *n.*

**comminuted fracture** a fracture in which the bone is broken into more than two pieces. A crushing force is usually responsible and there is often extensive injury to surrounding soft tissues.

**commissure** *n.* **1.** a bundle of nerve fibres that crosses the midline of the central nervous system, often connecting similar structures on each side. **2.** any other tissue connecting two similar structures.

**commotio retinae** swelling of the retina, usually resulting from blunt trauma to the eye. The swelling usually resolves over a few days.

**communicable disease (contagious disease, infectious disease)** any disease that can be transmitted from one person to another. This may occur by direct physical contact, by common handling of an object that has picked up infective microorganisms (*see* [FOMES](#)), through a disease *\*carrier*, or by

spread of infected droplets coughed or exhaled into the air. The most dangerous communicable diseases are on the list of *\*notifiable diseases*. Specific legal obligations arise in respect of notifiable diseases by virtue of the Public Health (Control of Disease) Act 1984 (as amended), delegated legislation, and the Health and Social Care Act 2008.

**communicable disease control** the control of disease due to infectious agents or their toxic products. *See* [CONSULTANT IN HEALTH PROTECTION](#).

**communicans** *adj.* communicating or connecting. The term is applied particularly to blood vessels or nerve fibres connecting two similar structures.

**communitarianism** *n.* an approach to ethics and politics that advocates a middle way between communism and liberalism, emphasizing family and community interests as well as individual *\*autonomy*, social responsibilities, and personal rights.

**community-acquired pneumonia (CAP)** *see* [PNEUMONIA](#).

**community health** preventive services, mainly outside the hospital, involving the surveillance of special groups of the population, such as preschool and school children, women, and the elderly, by means of routine clinical assessment and *\*screening tests*. Routine preventive measures, such as immunization, family planning, and dietary advice, are offered in special clinics staffed by *\*community nurses*, **clinical medical officers**, and **senior clinical medical officers** and sometimes by *\*community paediatricians*. When somebody is identified as having an illness, he (or she) is referred for treatment to a *\*general practitioner* or hospital as appropriate. *See also* [CHILD HEALTH CLINIC](#); [SCHOOL HEALTH SERVICE](#).

**community hospital** *see* [HOSPITAL](#).

**community interest group** (in Britain) any of the groups that work with NHS foundation trusts to represent the views of patients and other interested parties in setting the strategic direction of the trust. They are often formed around specific disease categories or patient groups (e.g. deaf patients, children in care).

**community medicine** *see* PUBLIC HEALTH MEDICINE.

**community mental health team (CMHT)** a multidisciplinary team consisting of psychiatrists, psychiatric nurses, psychologists, social workers, and occupational therapists who treat patients with severe mental illness in the community.

**community midwife (domiciliary midwife)** (in Britain) a registered *\*nurse* with special training in midwifery (both hospital and domiciliary practice). The midwife must be registered with the *\*Nursing and Midwifery Council* in order to practise; this requires regular refresher courses to supplement the basic qualification of **Registered Midwife (RM)**. Community midwives are attached to general practices or hospitals, and their work includes **home deliveries** and antenatal and postnatal care in the community.

**community nurses** (in Britain) a generic term for *\*health visitors*, *\*community midwives*, and *\*district nurses*. *See also* DOMICILIARY SERVICES.

**community paediatrician** a consultant in paediatrics with special responsibility for the care of children outside the hospital. *See also* COMMUNITY HEALTH.

**community services** *see* DOMICILIARY SERVICES.

**Community Treatment Order** *see* MENTAL HEALTH ACT.

**comparative mortality figure** *see* OCCUPATIONAL MORTALITY.

**compartment** *n.* (in anatomy) any one of the spaces in a limb that are bounded by bone and thick sheets of fascia and enclose the muscles and other tissues of the limb.

**compartment syndrome** the condition that results from swelling of the muscles in a *\*compartment* of a limb, which raises the pressure within the compartment so that the blood supply to the muscle is cut off, causing *\*ischaemia* and further swelling. If it persists, the muscles and nerves within the compartment die, leading to *\*Volkmann's contracture* (when the forearm is affected). Causes are trauma, damage to blood vessels, reperfusion after ischaemia, and tight casts or bandages. Treatment is to release any tight

dressings and to divide the fascia surrounding the compartment to relieve the pressure (*see* [FASCIOTOMY](#)). This should be performed urgently, within six hours from the onset of symptoms, to prevent permanent damage.

**compassion** *n.* the perception and, as far as is possible, understanding of another's suffering, important as a motivation in all caring professions. However, overwork may destroy fellow-feeling (**compassion fatigue**): professionals should be aware of this possibility and make sure they are looking after themselves properly (*see* [BURNOUT](#)). Kindness and understanding are often undervalued as components of treatment by professionals but not by patients.

**compatibility** *n.* the degree to which the body's defence systems will tolerate the presence of intruding foreign material, such as blood when transfused or a kidney when transplanted. Complete compatibility exists between identical twins: a blood transfusion between identical twins will evoke no *\*antibody* formation in the recipient. In severe **incompatibility**, for example between completely unrelated people, there are likely to be swift immune reactions as antibodies attack and destroy any offending antigenic material. *See also* [HISTOCOMPATIBILITY](#); [IMMUNITY](#). —**compatible** *adj.*

**compensation** *n.* **1.** the act of making up for a functional or structural deficiency. For example, compensation for the loss of a diseased kidney is brought about by an increase in size of the remaining kidney, so restoring the urine-producing capacity. **2.** financial redress for injury or loss caused, for example, by *\*negligence*, usually weighed against the degree of harm suffered.

**competence** *n.* *see* [CAPACITY](#).

**complaints system** a process that enables patients to voice concerns about the standard of care they receive. In the UK, any complaints should be raised as soon as possible, in the first instance locally with the NHS provider involved. Various statutory and voluntary advice and advocacy services are available to assist in this. If a patient is not satisfied with the outcome of local resolution, the matter can be referred to the *\*Parliamentary and Health Service Ombudsman*. Legal action cannot usually proceed at the same time and only a small proportion of complaints proceed to law. Disciplinary

procedures are separate from the complaints procedure although complaints may prompt or inform disciplinary action.

**complement** *n.* a system of functionally linked proteins that interact with one another to aid the body's defences when *\*antibodies* combine with *\*antigens*. Complement is involved in the breaking-up (*\*lysis*) and *\*opsonization* of foreign organisms. It is also involved in inflammation and clearing immune (antigen-antibody) complexes.

**complementary medicine** various forms of therapy that are viewed as complementary to conventional medicine. These include (but are not confined to) *\*osteopathy*, *\*acupuncture*, *\*homeopathy*, *\*massage*, *\*aromatherapy*, *\*reflexology*, and *\*reiki*. Previously, complementary therapies were regarded as an alternative to conventional therapies, and the two types were considered to be mutually exclusive (hence the former names **alternative medicine** and **fringe medicine**). However, many practitioners now have dual training in conventional and complementary therapies. There is very limited provision for complementary medicine within the National Health Service.

**complement fixation** the binding of *\*complement* to the complex that is formed when an antibody reacts with a specific antigen. Because complement is taken up from the serum only when such a reaction has occurred, testing for the presence of complement after mixing a suspension of a known organism with a patient's serum can give confirmation of infection with a suspected organism. The *\*Wassermann reaction* for diagnosing syphilis is a complement-fixation test.

**complex** *n.* **1.** (in psychoanalysis) an emotionally charged and repressed group of ideas and beliefs that is capable of influencing an individual's behaviour. The term in this sense was originally used by Jung, but it is now widely used in a looser sense to denote an unconscious motive. **2.** (in medicine) a patient's presentation in which there are a multitude of co-morbidities and/or social and psychological problems.

**complex partial seizure** *see* **EPILEPSY**.

**complex regional pain syndrome (CRPS, reflex sympathetic dystrophy, RSD, Sudek's atrophy)** neurological dysfunction in a limb following

trauma, surgery, or disease, characterized by intense burning pain, swelling, stiffness, and sweaty shiny mottled skin. It is caused by overactivity of the sympathetic nervous system. The **\*ESR** is often elevated, X-rays may reveal some patchy osteoporosis, and a bone scan usually demonstrates increased blood flow. Early treatment with splinting and physiotherapy are essential, in combination with **\*sympatholytic** drugs, corticosteroids, and regional sympathetic blocks; **\*sympathectomy** may be required in chronic cases.

**compliance** *n.* *see* **ADHERENCE**.

**complication** *n.* a disease or condition arising during the course of or as a consequence of another disease.

**compomer (polyacid-modified resin composite)** *n.* a dental filling material that is a hybrid of **\*composite resin** and **\*glass ionomer**.

**composite resin** a tooth-coloured restorative material for teeth. It is composed of two different materials: an inorganic filler chemically held in an organic resin. Composite resins are bonded to teeth using the **\*acid-etch technique** and usually hardened by polymerization initiated by intense light.

**compress** *n.* a pad of material soaked in hot or cold water and applied to an injured part of the body to relieve the pain of inflammation.

**compressed air illness (caisson disease)** a syndrome occurring in people working under high pressure in diving bells or at great depths with breathing apparatus. On return to normal atmospheric pressure nitrogen dissolved in the bloodstream expands to form bubbles, causing pain (the **bends**) and blocking the circulation in small blood vessels in the brain and elsewhere (**decompression sickness**). Pain, paralysis, and other features may be eliminated by returning the victim to a higher atmospheric pressure and reducing this gradually, so causing the bubbles to redissolve. Chronic compressed air illness may cause damage to the bones (*see* **OSTEONECROSIS**), heart, and lungs.

**compression venography** an **\*ultrasound** technique to look for deep vein **\*thrombosis**. Pressing the vein with the ultrasound probe usually causes it to empty and flatten, which does not occur if there is thrombus in the lumen. *See also* **VENOGRAPHY**.

**compulsion** *n.* an **\*obsession** that takes the form of a motor act, such as repetitive washing based on a fear of contamination, as seen in **\*obsessive–compulsive disorder**.

**compulsory admission (involuntary admission)** (in Britain) the entry and detention of a person within an institution without his or her consent, either because of mental illness (see **MENTAL HEALTH ACT**) or severe social deprivation and self-neglect (see **SECTION 47 REMOVAL**). Compare **VOLUNTARY ADMISSION**.

**computer-assisted surgery (image-guided surgery, surgical navigation)** a technique by which a virtual image or map of the patient is created from CT scans, MRI scans, X-rays, or ultrasound scans and loaded into a computer. Special instruments connected to the computer are then applied to certain reference points on the patient. The computer can then produce a picture of the location of the instrument within the patient.

**computerized radiography (CR)** a system for replacing photographic film with a charged plate. Exposure to X-rays knocks charge off the plate. The resultant image can be read by a laser beam and stored digitally or printed out as required. This system is widely used in conjunction with **\*PACS** systems.

**computerized tomographic angiography (CTA)** see **ANGIOGRAPHY**.

**computerized tomography (CT)** a form of X-ray examination in which the X-ray source and detector (**CT scanner**) rotate around the object to be scanned and the information obtained can be used to produce cross-sectional images (see **CROSS-SECTIONAL IMAGING**) by computer (a **CT scan**). A higher radiation dose is received by the patient than with some conventional X-ray techniques, but the diagnostic information obtained is far greater and should outweigh the increased risk. CT scanning can be used for all parts of the body. The data obtained can be used to construct three-dimensional images of structures of interest. See also **MULTIDETECTOR COMPUTERIZED TOMOGRAPHY**; **SPIRAL CT SCANNING**.

**conception** *n.* **1.** (in gynaecology) the start of pregnancy, when a male germ cell (sperm) fertilizes a female germ cell (ovum) in the **\*Fallopian tube**. **2.**

(in psychology) an idea or mental impression.

**conceptus** *n.* the products of conception: the developing fetus and its enclosing membrane at all stages in the uterus.

**concha** *n.* (*pl.* **conchae**) (in anatomy) any part resembling a shell. For example, the **concha auriculae** is a depression on the outer surface of the pinna (auricle), which leads to the external auditory meatus of the outer ear. *See also* [NASAL CONCHA](#).

**concomitant** *adj.* at the same time: describing drugs that are administered together or symptoms that occur during the same period.

**concordance** *n.* **1.** similarity of any physical characteristic that is found in both of a pair of twins. **2.** (in ethics) agreement between individuals or points of view.

**concretion** *n.* a stony mass formed within such an organ as the kidney, especially the coating of an internal organ (or a foreign body, such as a urinary catheter) with calcium salts. *See also* [CALCULUS](#).

**concussion** *n.* a condition caused by injury to the head, characterized by headache, confusion, and amnesia. These symptoms may be prolonged and constitute a **post-concussional syndrome**. There may be no recognizable structural damage to the brain, but scans may reveal evidence of [\\*contusion](#) (bruising) within the brain. Repeated concussion eventually causes symptoms suggesting brain damage. *See also* [PUNCH-DRUNK SYNDROME](#).

**condenser** *n.* (in microscopy) an arrangement of lenses beneath the stage of a microscope. It can be adjusted to provide correct focusing of light on the microscope slide.

**conditioned reflex** a reflex in which the response occurs not to the sensory stimulus that normally causes it but to a separate stimulus, which has been learnt to be associated with it. In Pavlov's classic experiments, dogs learned to associate the sound of a bell with feeding time and would salivate at the bell's sound whether food was then presented to them or not.

**conditioning** *n.* the establishment of new behaviour by modifying the stimulus/response associations. In **classical conditioning** a stimulus not

normally associated with a particular response is presented together with the stimulus that evokes the response automatically. This is repeated until the first stimulus evokes the response by itself (see **CONDITIONED REFLEX**). In **operant conditioning** a response is rewarded (or punished) each time it occurs, so that in time it comes to occur more (or less) frequently (see **REINFORCEMENT**).

**condom** *n.* a sheath made of latex rubber, plastic, or silk that is fitted over the penis during sexual intercourse. Use of a condom protects both partners against sexually transmitted diseases (including AIDS) and, carefully used, it is a reasonably reliable contraceptive (between 2 and 10 pregnancies per 100 woman-years). A more recent development is the **female condom** (e.g. **Femidom**), which is fitted into the vagina. Manufactured from similar materials as male condoms, they too act as both contraceptives and as barriers to sexually transmitted diseases.

**conduct disorder** a repetitive and persistent pattern of aggressive or otherwise antisocial behaviour. It is usually recognized in childhood or adolescence and may include such behaviours as unusually frequent and severe temper tantrums, arguing with adults, defying rules, being angry and resentful, cruelty to animals, lying or breaking promises, use of weapons, sexual aggression, destroying property, truancy, bullying, and general delinquency. It can lead to **\*antisocial personality disorder**. Treatment is usually with **\*behaviour therapy** or **\*family therapy**, although there is some debate as to whether it should be seen as a social rather than a medical problem.

**conducting tissue** a collection of specialized cells that transmits electricity within the heart. It may be normal (e.g. the **\*sinoatrial node**) or abnormal (e.g. an **\*accessory pathway**).

**condylarthrosis (condyloid joint)** *n.* a form of **\*diarthrosis** (freely movable joint) in which an ovoid head fits into an elliptical cavity. Examples are the knee joint and the joint between the mandible (lower jaw) and the temporal bone of the skull.

**condyle** *n.* a rounded protuberance that occurs at the ends of some bones, e.g. the **\*occipital bone**, and forms an articulation with another bone.

**condyloma** *n.* (*pl.* **condylomata**) a raised wartlike growth. **Condylomata acuminata** (*sing.* **condyloma acuminatum**) are warts caused by **\*human papillomavirus** and are found on the vulva, under the foreskin, or on the skin of the anal region. They may be treated with podophyllin, trichloroacetic acid, topical **\*imiquimod**, or cryotherapy; patients should be checked for the presence of other sexually transmitted diseases. **Condylomata lata** (*sing.* **condyloma latum**) are flat plaques found in the secondary stage of syphilis, occurring in the anogenital region.

**cone** *n.* one of the two types of light-sensitive cells in the **\*retina** of the eye (*compare* **ROD**). The human retina contains 6–7 million cones; they function best in bright light and are essential for acute vision (receiving a sharp accurate image). The area of the retina called the **\*fovea** contains the greatest concentration of cones. Cones can also distinguish colours. It is thought that there are three types of cone, each sensitive to the wavelength of a different primary colour – red, green, or blue. Other colours are seen as combinations of these three primary colours.

**cone beam** *see* **IMAGE-GUIDED RADIOTHERAPY**.

**cone biopsy** surgical removal, by knife or laser, of a cone-shaped segment of tissue from the cervix of the uterus. It may be performed if a cervical biopsy (*see* **COLPOSCOPY**) reveals evidence of cervical carcinoma in situ (**\*cervical intraepithelial neoplasia** type 3): the abnormal tissue is removed and examined microscopically for confirmation of complete removal of the abnormality.

**confabulation** *n.* the invention of circumstantial but fictitious detail about events supposed to have occurred in the past. Usually this is to disguise an inability to remember past events. It may be a symptom of any form of loss of memory, but typically occurs in **\*Korsakoff's syndrome**.

**confection** *n.* (in pharmacy) a sweet substance that is combined with a medicinal preparation to make it suitable for administration.

**confidence interval** (in statistics) a range of values for a parameter of interest that is estimated to contain the true value of the parameter within a given probability. For example, with a 95% confidence interval the parameter value will lie in this interval 95 times out of every 100.

**confidential enquiries** special enquiries that seek to improve health and health care by collecting evidence on aspects of care and disseminating recommendations based on these findings. **MBRRACE-UK** (Mothers and Babies; Reducing Risks through Audits and Confidential Enquiries in the UK) investigates maternal deaths, stillbirths, late fetal losses and terminations, and neonatal deaths (*see* **INFANT MORTALITY RATE**; **MATERNAL DEATH**; **MATERNAL MORTALITY RATE**; **PERINATAL MORTALITY RATE**). It replaced the Centre for Maternal and Child Enquiries (CMACE), which carried out this work until 2012. The **National Confidential Enquiry into Patient Outcome and Death** investigates general medical and surgical care, and the **National Confidential Inquiry into Suicide and Homicide by People with Mental Illness** covers the care of people with mental illness. \***NHS England** manages the contracts with the confidential enquiries.

**confidentiality** *n.* an ethical and legal obligation that requires doctors to keep information about their patients private. It is the foundation on which trust and the therapeutic relationship is built. A doctor automatically assumes such an obligation during a patient consultation. Confidentiality is generally considered to be held within the health-care team rather than with one particular professional in order to facilitate effective care, although stricter rules can apply in \***genitourinary medicine** and occupational health (among others). Confidentiality is not an unlimited duty and sometimes it is permissible or even obligatory to breach a patient's confidence, e.g. for child protection or when a patient suffers from a \***notifiable disease**. Confidentiality may also be breached where there is a serious risk of physical harm to an identifiable individual or individuals. However, since there is no 'duty to warn' in the UK, doctors are not obliged to breach confidentiality where there is a serious risk of harm. The GMC requires that doctors should be prepared to justify their decision whether or not they decide to breach confidentiality in cases of serious risk. *See also* **DATA PROTECTION**; **PRIVACY**. —**confidential** *adj.*

**conflict** *n.* (in psychology) the state produced when a stimulus produces two opposing reactions. The basic types of conflict situation are **approach–approach**, in which the individual is drawn towards two attractive – but mutually incompatible – goals; **approach–avoidance**, where the stimulus

evokes reactions both to approach and to avoid; and **avoidance—avoidance**, in which the avoidance reaction to one stimulus would bring the individual closer to an equally unpleasant stimulus. Conflict has been used to explain the development of neurotic disorders, and the resolution of conflict remains an important part of psychoanalysis. *See also* [CONVERSION](#).

**conflict of interest** (in medical ethics) the situation in which a health professional is subject to potential or actual pressures that may conflict with his or her obligation to promote the *\*best interests* of the patient over and above all else. A conflict of interest arises from a particular context or situation and may threaten a doctor's integrity and undermine trust between professional and patient. For example, a drug company may encourage a doctor to prescribe a particular medicine, which may not be the treatment of choice for a patient, or contractual financial disincentives may discourage a doctor from providing a more expensive treatment of choice for a patient. In medical research, there is always a potential conflict between protecting the individual and benefiting society. Particular problems of this kind occur in randomized controlled trials (*see* [EQUIPOISE](#); [INTERVENTION STUDY](#)). Doctors will always experience competing pressures and it is important for them to be able to recognize and then, where possible, disclose, resolve, or mitigate morally problematic conflicts.

**confluence** *n.* a point of coalescence. The **confluence of the sinuses** is the meeting point of the superior sagittal, transverse, straight, and occipital venous sinuses in the dura mater in the occipital region of the skull.

**confocal microscopy** a light microscopic technique used to increase optical resolution and contrast.

**confounding** *n.* the situation in which an apparent association between two *\*variables* is in fact explained by a third variable that correlates with one or both of the variables under investigation. If confounding is not recognized, it can lead to the false assumption that two variables are directly related, known as a **spurious correlation**.

**congenital** *adj.* describing a condition that is recognized at birth or that is believed to have been present since birth. Congenital malformations include all disorders present at birth whether they are inherited or caused by an environmental factor.

**congenital adrenal hyperplasia** a family of autosomal **\*recessive** genetic disorders causing decreased activity of any of the enzymes involved in the synthesis of **\*cortisol** from **\*cholesterol**. The most commonly affected enzymes are 21-hydroxylase and 11-hydroxylase, and each enzyme deficiency can itself be due to a variety of genetic mutations. The clinical manifestations depend on which enzyme is affected and the resultant deficiencies and build-up products produced. The most serious consequence is adrenal crisis and/or severe salt wasting due to lack of cortisol and/or aldosterone, which may prove fatal if undiagnosed. The condition is often easier to spot at birth in females, who may have indeterminate genitalia due to high levels of **\*testosterone** in utero. Adrenal hyperplasia occurs due to excessive stimulation of the glands by **\*ACTH** (adrenocorticotrophic hormone) in response to the resultant cortisol deficiency of these conditions. Less complete deficiencies of the enzymes concerned may present for the first time in young women after puberty, with signs of androgen excess and menstrual irregularity mimicking **\*polycystic ovary syndrome**.

**congenital diaphragmatic hernia (CDH)** herniation of the fetal abdominal organs into the fetal chest, which occurs in one in 2000–5000 live births. This leads to pulmonary **\*hypoplasia**, which is the main cause of the associated high neonatal mortality. The risk of pulmonary hypoplasia is substantially greater where there is herniation of the liver into the thoracic cavity. CDH is commonly associated with additional structural abnormalities (cardiac, neural tube defects, and exomphalos), and the risk of chromosomal abnormality (**\*aneuploidy**) is 10–20%. Demonstration of a fluid-filled bowel at the level of the heart on ultrasound is diagnostic.

**congenital dislocation of the hip (CDH)** an abnormality present at birth in which the head of the femur is displaced or easily displaceable from the acetabulum (socket) of the ilium, which is poorly developed; it frequently affects both hip joints. CDH occurs in about 1.5 per 1000 live births, being more common in first-born girls, in breech deliveries, and if there is a family history of the condition. The leg is shortened and has a reduced range of movement, and the skin creases may be asymmetrical. All babies are routinely screened for CDH at birth and at developmental check-ups by gentle manipulation of the hip causing it to be reduced and dislocated with a clunk (see **BARLOW MANOEUVRE**; **ORTOLANI MANOEUVRE**). The diagnosis is confirmed by X-ray or ultrasound scan. Treatment is with a

special harness holding the hip in the correct position. If this is unsuccessful, the hip is reduced under anaesthetic and held with a plaster of Paris cast or the defect is corrected by surgery. Successful treatment of an infant can give a normal hip; if the dislocation is not detected, the hip does not develop normally and osteoarthritis develops at a young age.

**congenitally corrected transposition** *see* **TRANSPOSITION OF THE GREAT VESSELS**.

**congestion** *n.* an accumulation of blood within an organ due to back pressure within its veins (for example congestion of the lungs and of the liver occurs in heart failure). Congestion may be associated with **\*oedema** (accumulation of fluid in the tissues). It is relieved by treatment of the cause.

**congestive cardiac failure (CCF, congestive heart failure)** *see* **HEART FAILURE**.

**Congo red** a dark-red or reddish-brown pigment that becomes blue in acidic conditions. It is used as a histological **\*stain**. **\*Amyloidosis** is indicated if over 60% of the dye disappears from the blood within one hour of injection.

**coniine** *n.* an extremely poisonous alkaloid, found in hemlock (*Conium maculatum*), that paralyses the nerves, mainly the motor nerves. Coniine has been included in drug preparations for the treatment of asthma and whooping cough.

**coning** *n.* prolapse of the brainstem through the **\*foramen** magnum as a result of raised intracranial pressure: it is usually immediately fatal. A similar emergency can occur through the hiatus of the **\*tentorium**.

**conization** *n.* surgical removal of a cone of tissue. The technique is commonly used in excising a portion of the cervix (neck) of the uterus (*see* **CONE BIOPSY**) for the treatment of cervicitis or early cancer (carcinoma in situ).

**conjoined twins** identical twins that are physically joined together at birth, known colloquially as **Siamese twins**. The condition ranges from twins joined only by the umbilical blood vessels (allantoido-angiopagous twins) to those in whom conjoined heads or trunks are inseparable.

**conjugate (conjugate diameter, true conjugate)** *n.* the distance between the front and rear of the pelvis measured from the most prominent part of the sacrum to the back of the pubic symphysis. Since the true conjugate cannot normally be measured during life it is estimated by subtracting 1.3–1.9 cm from the **diagonal conjugate**, the distance between the lower edge of the symphysis and the sacrum (usually about 12.7 cm). If the true conjugate is less than about 10.2 cm, delivery of an infant through the natural passages may be difficult or impossible, and **\*Caesarean section** may have to be performed.

**conjugation** *n.* the union of two microorganisms in which genetic material (DNA) passes from one organism to the other. In bacteria minute projections on the donor ‘male’ cell (**pili**) form a bridge with the recipient ‘female’ cell; the exact function of the pili is not known, but they are believed to have an important role in conjugation.

**conjunctiva** *n.* the delicate mucous membrane that covers the front of the eye and lines the inside of the eyelids. The conjunctiva lining the eyelids contains many blood vessels but that over the eyeball contains few and is transparent. —**conjunctival** *adj.*

**conjunctivitis (pink eye)** *n.* inflammation of the conjunctiva, which becomes red and swollen and produces a watery or pus-containing discharge. It causes discomfort rather than pain and does not usually affect vision. Conjunctivitis may be caused by infection by bacteria or viruses (in which case it usually spreads rapidly to the other eye) or physical or chemical irritation. The patient usually recovers with no after-effects in one to three weeks; bacterial infections respond to antibiotic eye drops. **Allergic (or vernal) conjunctivitis** is acute or chronic inflammation of the cornea usually due to a specific allergen, such as pollen, animal danders, or dust. It is characterized by itching, irritation, redness, watering of the eyes, and light sensitivity. *See also* **INCLUSION CONJUNCTIVITIS; TRACHOMA.**

**connective tissue** the tissue that supports, binds, or separates more specialized tissues and organs or functions as a packing tissue of the body. It consists of an amorphous **ground substance** of mucopolysaccharides in which may be embedded white (collagenous), yellow (elastic), and reticular fibres, fat cells, **\*fibroblasts**, **\*mast cells**, and **\*macrophages** (see

illustration). Variations in chemical composition of the ground substance and in the proportions and quantities of cells and fibres give rise to tissues of widely differing characteristics, including bone, cartilage, tendons, and ligaments as well as *\*adipose*, *\*areolar*, and *\*elastic tissues*.

**Connective tissue.** Loose (areolar) connective tissue.

**connective-tissue disease** any one of a group of diseases that are characterized by inflammatory changes in connective tissue and can affect virtually any body system. Formerly known as **collagen diseases** (connective-tissue disease has been the preferred term since 1978), they include *\*dermatomyositis*, systemic and discoid *\*lupus erythematosus*, *\*morphoea*, *\*polyarteritis nodosa*, and *\*rheumatoid arthritis*.

**Conn's syndrome** the combination of muscular weakness, abnormally intense thirst (polydipsia), the production of large volumes of urine (polyuria), and hypertension, resulting from excessive production of the hormone aldosterone by the adrenal cortex (*see* **ALDOSTERONISM**). It is a rare cause of hypertension. [W. J. Conn (1907–94), US physician]

**consanguinity** *n.* relationship by blood; the sharing of a common ancestor within a few generations.

**conscientious objection** a refusal to behave in a socially or legally accepted way because such behaviour is counter to one's personal beliefs, principles, or values. Conscientious objection is commonly, but not always, based on religious belief. In some areas of medical practice, there is legal provision allowing for conscientious objection; for example, by virtue of the Abortion Act 1967, section 4(1), a doctor can lawfully refuse to perform an abortion on the grounds of a conscientious objection but must refer the patient to a colleague who will carry out the procedure. Adherents of some religious denominations, such as Jehovah's Witnesses, may refuse life-saving treatments, frequently those involving blood products, on the grounds of conscience and religious belief, and provided the patient has capacity, a doctor is bound to respect the wishes or **\*autonomy** of the patient.

**consent** *n.* agreement to undergo any medical treatment or to participate in medical research. Three criteria must be met for consent to be legally valid, namely that the patient must: (i) have capacity to make a choice; (ii) be provided with sufficient information (*see* **INFORMED CONSENT**) as to the nature of treatment, its likely consequences, and the possible effects of not having treatment; (iii) be in a position to decide voluntarily, i.e. without external pressure or influence, which may entail giving the patient time to consider the options. In addition, the patient should be informed that they can change their mind about treatment at any point. Valid consent usually provides a legal defence against the charge of **\*battery** (trespass against the person). Claims of **\*negligence** may be brought if the doctor discloses insufficient or inadequate information or fails to answer the patient's questions and address his or her concerns. Consent need not be in writing, but the more invasive the treatment proposed the greater the need for evidence of consent to be recorded. Signed consent forms are commonly used for this purpose, and are legally required when recruiting a subject to a clinical trial. Valid consent is not required in an emergency or where a patient lacks capacity. The concept of **\*therapeutic privilege** formerly provided a further exception to the requirement that patients should give valid consent, but its scope of application is now much more narrowly defined. *See also* **ASSENT**; **AUTONOMY**.

**consequentialism** *n.* a variety of ethical theories arguing that the morality of an action, rule, or way of life can be determined by its outcome or consequences, rather than by its intrinsic nature or the motives or character of those performing or following it. The best known example of consequentialism is **\*utilitarianism**, which in general seeks to achieve maximum utility or good outcomes for the greatest possible number of people in society.

In medical ethics, the principles of **\*beneficence** and **\*nonmaleficence** can be seen as consequentialist in their concern with outcomes but also as **\*deontological** in that they are regarded as duties. A **\*cost–benefit analysis** or **\*risk–benefit analysis** on utilitarian principles is often carried out when distributing medical resources or deciding between treatments. A calculation of this kind also forms the basis of the quality-adjusted life years (QALYs) system (see **QUALITY OF LIFE**).

A major objection to consequentialism is that the consequences of actions cannot always be predicted or perceived. Questions also arise regarding the likelihood of the consequences, whom they will affect (individuals, populations, animals, the environment), and by whom and what means they should be evaluated. —**consequentialist** *adj.*

**conservative treatment** treatment aimed at preventing a condition from becoming worse, in the expectation that either natural healing will occur or progress of the disease will be so slow that no drastic treatment will be justified. Compare **RADICAL TREATMENT**.

**consolidation** *n.* **1.** the state of the lung in which the alveoli (air sacs) are filled with fluid produced by inflamed tissue, as in **\*pneumonia**. It is diagnosed from its dullness to **\*percussion**, bronchial breathing (see **BREATH SOUNDS**) in the patient, and from the distribution of shadows on the chest X-ray. **2.** the stage of repair of a broken bone following **\*callus** formation, during which the callus is transformed by **\*osteoblasts** into mature bone.

**constipation** *n.* a condition in which bowel evacuations occur infrequently, or in which the faeces are hard and small, or where passage of faeces causes difficulty or pain. The frequency of bowel evacuation varies considerably from person to person. Constipation developing in a person of previously regular bowel habit may be a symptom of intestinal disease and may require

further investigation. Recurrent or longstanding constipation is treated by increasing fluid intake, *\*dietary fibre* (roughage), *\*laxatives*, or *\*enemas*, and by withdrawing medications that promote constipation (such as opiates). **Faecal impaction**, the end-result of chronic constipation (more common in the elderly and the very young), often requires manual removal of the faecal bolus (**faecal disimpaction**), sometimes under an anaesthetic.

**constrictor** *n.* any muscle that compresses an organ or causes a hollow organ or part to contract.

**consultant** *n.* a fully trained specialist in a branch of medicine. In Britain, consultants are responsible for the care of patients within a distinct specialty, usually in hospital wards, but they are allowed to opt for some sessions in private practice in addition to any National Health Service commitments. After completion of the *\*Foundation Programme* and (from 2019) the Internal Medicine Training programme doctors continuing in hospital service undertake further training as **specialty registrars** in their chosen specialty. When a specialty registrar has successfully completed a defined college or faculty specialist training programme, he or she is awarded a **Certificate of Completion of Training** (CCT) and is eligible to apply for a consultant post. *See also* **DOCTOR**.

**Consultant in Health Protection (CHP)** a consultant within *\*Public Health England* who is responsible for the surveillance, prevention, and control of communicable disease and noncommunicable environmental exposures. While no longer the preferred term, the older form **Consultant in Communicable Disease Control (CCDC)** is still sometimes used. *See also* **PUBLIC HEALTH CONSULTANT**.

**consumption** *n.* any disease causing wasting of tissues, especially (formerly) pulmonary tuberculosis. —**consumptive** *adj.*

**contact** *n.* transmission of an infectious disease by touching or handling an infected person or animal (**direct contact**) or by **indirect contact** with airborne droplets, faeces, etc., containing the infective microorganism.

**contact lenses** lenses worn directly against the eye, separated from it only by a film of tear fluid. **Corneal microlenses** cover only the cornea, while **haptic lenses** cover some of the surrounding sclera as well. Contact lenses

are used mainly in place of spectacles, to correct errors of refraction, but also in a protective capacity (*see* [BANDAGE LENS](#)). Contact lenses are made of a variety of materials, such as glass, plastic, and silicone; soft gas-permeable lenses have mostly replaced hard Perspex lenses.

**contact therapy** a form of [\\*radiotherapy](#) in which a radioactive substance is brought into close contact with the part of the body being treated. Needles or capsules of the isotope may be implanted in or around a tumour so that the radiation they emit will destroy it. *Compare* [TELETHERAPY](#).

**contagious disease** originally, a disease transmitted only by direct physical contact: now usually taken to mean any [\\*communicable disease](#).

**continent diversion** *see* [URINARY DIVERSION](#).

**continuity of care** a continuous relationship between a patient and an identified health-care professional who is the sole source of care and information for the patient. However, as a patient's health-care needs over time can rarely be met by a single professional, multiprofessional pathways of continuity exist to achieve both quality of care and patient satisfaction.

**continuous patient pathway** the route that a patient takes through the health-care system, from first admission to a hospital or treatment centre to final discharge. This may consist of one or more [\\*spells](#) in particular hospitals and one or more [\\*finished consultant episodes](#). For example, a patient admitted to a district general hospital, transferred to a tertiary hospital for a specialist procedure, and then transferred back to the district general hospital for recovery would experience one continuous patient pathway but three spells.

**continuous positive airways pressure (CPAP)** an air pressure in the range 5–30 cm H<sub>2</sub>O (1.2–7.5 mPa). It can be applied to the upper airways using a full face mask or a nasal mask only (nCPAP). It is used in high-dependency units to optimize oxygen delivery to patients who are being weaned from ventilators and on patients at home with [\\*obstructive sleep apnoea](#). It works by improving nasopharyngeal airways, reducing the work of breathing, and preventing basal [\\*atelectasis](#) during sleep.

**continuous subcutaneous insulin infusion** the administration of insulin by continuous infusion into the subcutaneous tissue via a small pump worn under the clothing and connected to the skin by a tube and a fine needle. The insulin is delivered at a precalculated background rate, but patient-activated **\*boluses** can be administered at meal times. This method is particularly appropriate (as an alternative to regular injections) for patients with repeated or unpredictable episodes of hypoglycaemia.

**contra-** *prefix denoting against or opposite.* Example: **contraversion** (turning away from).

**contraception** *n.* the prevention of unwanted pregnancy, which can be achieved by various means. Hormonal contraceptives (combined oestrogen and progestogen or progestogen only) act by preventing ovulation. They are usually taken in regular oral doses (*see* **ORAL CONTRACEPTIVE**), but may also be administered through the skin, by means of an adhesive patch impregnated with the hormones, or by three- or two-monthly injections of a long-acting progestogen. More recently developed methods for continuous administration of the hormones include subcutaneous implants of progestogen (**Nexplanon**) and hormonal intrauterine devices (*see* **IUS**). Methods that aim to prevent fertilization of the ovum include **\*coitus interruptus**, the **\*condom**, the **\*diaphragm**, and surgical intervention (tubal occlusion and vasectomy: *see* **STERILIZATION**). Methods that aim to prevent implantation of a fertilized ovum in the uterus include the intrauterine contraceptive device (*see* **IUCD**); these methods can be used after intercourse but before implantation (*see* **POSTCOITAL CONTRACEPTION**). Couples whose religious beliefs forbid the use of mechanical or hormonal contraceptives may use the **\*rhythm method**, in which intercourse is limited to those days in the menstrual cycle when conception is least likely.

**contraction** *n.* the shortening of a muscle in response to a motor nerve impulse. This generates tension in the muscle, usually causing movement.

**contracture** *n.* **\*fibrosis** of skeletal muscle or connective tissue producing shortening and resulting in deformity of a joint. *See also* **DUPUYTREN'S CONTRACTURE**; **VOLKMANN'S CONTRACTURE**.

**contraindication** *n.* any factor in a patient's condition that makes it unwise to pursue a certain line of treatment. For example, an attack of pneumonia in a patient would be a strong contraindication against the use of a general anaesthetic.

**contralateral** *adj.* on or affecting the opposite side of the body: applied particularly to paralysis (or other symptoms) occurring on the opposite side of the body from the brain lesion that caused them.

**contralateral-routing-of-signal hearing aid (CROS hearing aid)** a form of hearing aid used to help people with severe or profound unilateral hearing loss. Sound information is collected by a microphone worn on the affected side and then transmitted by a thin wire or Bluetooth wireless technology to a device worn on the opposite side. If the hearing in the better ear is normal, no amplification is applied to the signal. If the better ear has a hearing loss the device also acts as a conventional hearing aid and amplifies the signal from both sides: this is known as a **BICROS hearing aid**.

**contrast** *n.* **1.** short for *\*contrast medium*, e.g. **post-contrast CT scan**. **2.** the difference in the shade of grey between different tissues on a diagnostic image, such as radiograph or CT scan (*see* **GREY SCALE**).

**contrast medium (contrast agent)** a substance administered to enhance the visibility of structures (i.e. increase the contrast) during imaging. In *\*radiography* a positive contrast agent (e.g. *\*barium sulphate* or a water-soluble iodine-containing compound) increases the density of a structure. Gas is a negative contrast agent. Positive and negative contrast media can be used together (e.g. barium sulphate and gas in a double-contrast *\*barium enema*). Magnetic resonance (MR) contrast agents contain either a positive contrast atom (usually gadolinium) to increase the signal or a negative contrast atom (such as iron) to decrease it. Ultrasound contrast medium consists of tiny (1–10 µm diameter) bubbles of gas, which reflect back the sound waves strongly. They can also be made to resonate or rupture to increase the signal to the ultrasound probe.

**contrast nephropathy** deterioration in renal function (of more than 25%) after administration of radiocontrast material. Development of this condition is more likely when there is pre-existing renal disease (the most important factor) or diabetes, vasoconstriction, simultaneous use of NSAIDs, and large

amounts of radiocontrast are used. It is thought that the radiocontrast induces vasoconstriction in the vessels supplying the medulla of the kidney and aggravates hypoxia in this part of the kidney.

**contrecoup** *n.* injury of a part resulting from a blow on its opposite side. This may happen, for example, if a blow on the back of the head causes the front of the brain to be pushed against the inner surface of the skull.

**controlled drug** *see* [MISUSE OF DRUGS ACT 1971](#).

**controlled ovarian stimulation (COS)** *see* [SUPEROVULATION](#).

**controlled trial** *see* [INTERVENTION STUDY](#).

**contusion** *n.* **1.** *see* [BRUISE](#). **2.** any of various degrees of bruising of the brain (**cerebral contusion**), resulting from [\\*head injury](#) or surgery. Clinical signs range from [\\*concussion](#) to [\\*coma](#), reflecting the severity of the trauma.

**conus arteriosus** the front upper portion of the right ventricle adjoining the pulmonary arteries.

**conus medullaris** the conical end of the spinal cord, at the level of the lower end of the first lumbar vertebra.

**convergence** *n.* **1.** (in neurology) the formation of nerve tracts by fibres coming together into one pathway from different regions of the brain. **2.** (in ophthalmology) the ability of the eyes to turn inwards and focus on a near point so that a single image is formed on both retinas. The closer the object, the greater the degree of convergence.

**convergence insufficiency** a condition in which the eyes fail to turn inwards enough to achieve fusion of separate images during near vision. In some cases, convergence exercises (*see* [ORTHOPTICS](#)) can improve the condition.

**conversion** *n.* (in psychiatry) the expression of [\\*conflict](#) as physical symptoms. Psychoanalysts believe that the repressed instinctual drive is manifested as motor or sensory loss, such as paralysis, rather than as speech or action. This is thought to be one of the ways in which [\\*conversion disorder](#) is produced. An easier way to conceptualize conversion is as a physical expression of emotional distress.

**conversion disorder** a psychological conflict or need that manifests itself as an organic dysfunction or physical symptom. The sufferer may display symptoms of blindness, deafness, loss of sensation, gait abnormalities, false memory, or paralysis of various parts of the body. None of these can be accounted for by organic disease. Conversion disorder was formerly known as *\*hysteria*. It is classified with *\*dissociative disorders* (as dissociative (conversion) disorders) in ICD-11 (*see* [INTERNATIONAL CLASSIFICATION OF DISEASES](#)). It is also included under the classification of *\*somatoform disorders*.

**conversion seizure** *see* [NON-EPILEPTIC SEIZURE](#).

**convolution** *n.* a folding or twisting, such as one of the many that cause the fissures, sulci, and gyri of the surface of the *\*cerebrum*.

**convulsion** *n.* an involuntary contraction of the muscles producing contortion of the body and limbs. Rhythmic convulsions of the limbs are a feature of major *\*epilepsy*. *\*Febrile convulsions* are provoked by fever in otherwise healthy infants and young children.

**Cooksey–Cawthorne exercises** a series of physical exercises used in the rehabilitation of patients with certain forms of *\*vertigo*.

**Cooley's anaemia** *see* [THALASSAEMIA](#). [T. B. Cooley (1871–1945), US paediatrician]

**Coombs' test** a means of detecting rhesus antibodies on the surface of red blood cells that precipitate proteins (globulins) in the blood serum. The test is used in the diagnosis of haemolytic anaemia in babies with rhesus incompatibility in whom there is destruction of red blood cells (*see* [HAEMOLYTIC DISEASE OF THE NEWBORN](#)). [R. R. A. Coombs (1921–2006), British immunologist]

**Copaxone** *n.* *see* [GLATIRAMER](#).

**COPD** *see* [CHRONIC OBSTRUCTIVE PULMONARY DISEASE](#).

**co-phenotrope** *n.* a drug used in the treatment of diarrhoea. It consists of a mixture of diphenoxylate hydrochloride (an opioid that reduces *\*peristalsis*)

and atropine (which relaxes the smooth muscle of the gut) in a ratio of 100 to 1.

**copr- (copro-)** *combining form denoting faeces.* Example: **coprophobia** (abnormal fear of).

**coprolalia** *n.* the repetitive speaking of obscene words. It can be involuntary, as part of *\*Tourette's syndrome*.

**coprolith** *n.* *see* **FAECALITH**.

**coproporphyrin** *n.* a *\*porphyrin* compound formed during the synthesis of protoporphyrin IX, a precursor of *\*haem*. Coproporphyrin is excreted in the faeces in **hereditary coproporphyria**.

**copulation** *n.* *see* **COITUS**.

**cor** *n.* the heart.

**coracoid process** a beaklike process that curves upwards and forwards from the top of the *\*scapula*, over the shoulder joint.

**cord** *n.* any long flexible structure, which may be solid or tubular. Examples include the spermatic cord, spinal cord, umbilical cord, and vocal cord.

**cordectomy** *n.* surgical removal of a vocal cord or, more usually, a piece of the vocal cord (**partial cordectomy**).

**cordocentesis** *n.* the removal of a sample of fetal blood by inserting a fine hollow needle through the abdominal wall of a pregnant woman, under ultrasound guidance, into the umbilical vein. Cordocentesis is most commonly performed for confirmation of fetal *\*packed cell volume* prior to intrauterine transfusion in cases of haemolytic disease of the newborn or for confirmation of infection in the fetus. *See also* **FETAL BLOOD SAMPLING**.

**cordotomy** *n.* a surgical procedure for the relief of severe and persistent pain in the pelvis or lower limbs. The nerve fibres that transmit the sensation of pain to consciousness pass up the spinal cord in special tracts (the **spinothalamic tracts**). In cordotomy the spinothalamic tracts are severed in the cervical (neck) region.

**cord presentation** the position of the umbilical cord when it lies below the presenting part of the fetus in an intact bag of membranes. *See also* **CORD PROLAPSE**.

**cord prolapse** rupture of the membranes in cases of a **\*cord presentation**. It is an obstetric emergency: there is a severe risk of cord compression and spasm causing fetal asphyxia (*see* **HYPOXIC-ISCHAEMIC ENCEPHALOPATHY**). Delivery must occur as soon as possible and the presenting part displaced away from the cord.

**Cordylobia** *n. see* **TUMBU FLY**.

**corectopia** *n.* displacement of the pupil towards one side from its normal position in the centre of the iris. When present from birth, the displacement is usually inwards towards the nose. Scarring of the iris from inflammation may also draw the pupil out of position.

**co-registration (fusion imaging)** *n.* (in diagnostic imaging) the process of taking two images obtained by different techniques and (usually electronically) laying them on top of each other after suitable adjustment, so that the anatomical landmarks coincide. This can give more accurate information as one technique shows the anatomy and the other shows the pathology. Co-registering can thus show which part of the body is involved in the disease process. It is typically used in **\*PET/CT scanning**. CT or MRI scans can also be fused onto real time ultrasound images to target a lesion for biopsy or treatment.

**corium** *n. see* **DERMIS**.

**corn** *n.* an area of hard thickened skin on or between the toes or elsewhere on the foot: a type of **\*callosity** produced by ill-fitting shoes. The horny skin layers form an inverted pyramid that presses down into the deeper skin layers, causing pain. A corn may be treated by applying salicylic acid or by podiatry.

**cornea** *n.* the transparent circular part of the front of the eyeball. It refracts the light entering the eye onto the lens, which then focuses it onto the retina. The cornea contains no blood vessels and it is extremely sensitive to pain.

The innermost layer (**corneal endothelium**) consists of a single layer of cells that cannot regenerate. —**corneal** *adj.*

**corneal arcus** a white or greyish line in the periphery of the cornea, concentric with but separated from the edge by a clear zone. It begins above and below but may become a continuous ring. It consists of an infiltration of fatty material and is common in the elderly (**arcus senilis**). When it occurs in younger people (**arcus juvenilis**) it may indicate \***hyperlipidaemia**. It does not affect vision.

**corneal graft** *see* **KERATOPLASTY**.

**corneal reflex** reflex blinking of both eyes normally elicited by lightly touching the cornea of one eye. This reflex is lost in deep coma, during general anaesthesia, and in death; it is therefore one of the tests used to confirm brainstem death.

**corneal ring** a ring designed to be inserted into the peripheral tissue of the cornea in order to alter the curvature of the corneal surface. It is undergoing trials to assess its ability to correct errors of refraction. In myopia (short-sightedness), for example, the ring would be required to stretch the corneal tissue peripherally and thus flatten the central corneal curvature in order to correct the myopia.

**corneal topography (videokeratography)** an imaging technique used to study the shape and refractive power of the cornea in detail. An image projected onto the cornea is analysed by a computer to produce a representation of the shape and refractive power of the corneal surface. Corneal topography has an important role in the management of corneal disease and refractive surgery.

**cornification** *n. see* **KERATINIZATION**.

**cornu** *n. (pl. cornua)* (in anatomy) a horn-shaped structure, such as the horn-shaped processes of the hyoid bone and thyroid cartilage. *See also* **HORN**.

**corona** *n.* a crown or crownlike structure. The **corona capitis** is the crown of the head.

**coronal** *adj.* relating to the crown of the head or of a tooth. The **coronal plane** divides the body into dorsal and ventral parts (see illustration overleaf).

**Coronal.** The coronal plane of section through the body and through the left foot.

**coronal suture** *see* **SUTURE**.

**corona radiata** **1.** a series of radiating fibres between the cerebral cortex and the internal capsule of the brain. **2.** a layer of follicle cells that surrounds a freshly ovulated ovum. The cells are elongated radially to the ovum when seen in section.

**coronary angiography** an X-ray technique for examination of the coronary arteries, often taken to also include examination of the chambers of the heart.

A catheter is introduced via the radial artery at the wrist or the femoral artery at the groin and manipulated into the heart under X-ray control. **\*Contrast medium** is then injected to outline the ventricles and coronary arteries. Digital video images are recorded during contrast-medium injection. Coronary angiography is used to diagnose cardiac disease, specifically narrowing or blockage in the coronary arteries, and plan treatment by surgery or radiological interventional techniques (see **CORONARY ARTERY BYPASS GRAFT**; **PERCUTANEOUS CORONARY INTERVENTION**). It has now largely been replaced by CT coronary angiography.

**coronary angioplasty** a procedure in which a narrowed segment of coronary artery is stretched (dilated) by the inflation of a balloon introduced into it by means of cardiac **\*catheterization** under X-ray screening (see **ANGIOPLASTY**). In most cases a **\*stent** is then implanted into the angioplastied segment as this improves duration.

**coronary arteries** the arteries supplying blood to the heart. The **right** and **left coronary arteries** arise from the aorta, just above the aortic valve, and form branches encircling the heart. See **CORONARY ANGIOPLASTY**; **CORONARY ARTERY BYPASS GRAFT**.

**coronary artery bypass graft (CABG)** **\*coronary revascularization** in which a segment of a coronary artery narrowed by atheroma is bypassed by an **\*autologous** section of healthy saphenous vein or internal mammary artery at **\*thoracotomy**. The improved blood flow resulting from one or more such grafts relieves **\*angina pectoris** and reduces the risk of **\*myocardial infarction**. Recently developed techniques of **\*minimally invasive surgery** have enabled the operation to be performed without the need for thoracotomy.

**coronary artery disease (CAD)** **\*atherosclerosis** of the coronary arteries, which may cause **\*angina pectoris** and lead to **\*myocardial infarction**. One of the leading causes of death in Western countries, the disease occurs most frequently in populations with diets high in cholesterol, saturated fats, and refined carbohydrates. Other risk factors include hypertension, diabetes mellitus, and smoking.

**coronary care unit (CCU)** a designated ward of a hospital to which the most serious cardiac cases are transferred for specialist monitoring and treatment.

**coronary revascularization** the restoration of blood flow to ischaemic heart muscle (*see* ISCHAEMIA) by *\*coronary angioplasty* and *\*stenting* or by a *\*coronary artery bypass graft*.

**coronary thrombosis** the formation of a blood clot (thrombus) in the coronary artery, which obstructs the flow of blood to the heart. This is usually due to underlying *\*atheroma* of the arterial wall, and results in the death (infarction) of part of the heart muscle. For symptoms and treatment, *see* MYOCARDIAL INFARCTION.

**coroner** *n.* the official who presides at an *\*inquest*. He or she must be either a medical practitioner or a lawyer of at least five years' standing.

**coronoid process** **1.** a process on the upper end of the *\*ulna*. It forms part of the notch that articulates with the humerus. **2.** the process on the ramus of the *\*mandible* to which the temporalis muscle is attached.

**cor pulmonale** enlargement of the right ventricle of the heart due to excessive pressure loading that results from diseases of the lungs or the pulmonary arteries. Such diseases include those affecting the structure of the lungs (e.g. emphysema) or their function (e.g. obesity) except when these changes result from congenital heart disease or diseases primarily affecting the left side of the heart.

**corpus** *n.* (*pl.* **corpora**) any mass of tissue that can be distinguished from its surroundings.

**corpus albicans** the residual body of scar tissue that remains in the ovary at the point where a *\*corpus luteum* has regressed after its secretory activity has ceased.

**corpus callosum** the broad band of nervous tissue that connects the two cerebral hemispheres, containing an estimated 300 million fibres. *See* CEREBRUM.

**corpus cavernosum** either of a pair of cylindrical blood sinuses that form the erectile tissue of the *\*penis* and clitoris. In the penis a third sinus, the corpus

spongiosum, encloses the urethra and extends into the glans. All these sinuses have a spongelike structure that allows them to expand when filled with blood.

**corpuscle** *n.* any small particle, cell, or mass of tissue.

**corpus luteum** the glandular tissue in the ovary that forms at the site of a ruptured **\*Graafian follicle** after ovulation. It secretes the hormone **\*progesterone**, which prepares the uterus for implantation. If implantation fails the corpus luteum becomes inactive and degenerates. If an embryo becomes implanted the corpus luteum continues to secrete progesterone until the fourth month of pregnancy, by which time the placenta has taken over this function.

**corpus spongiosum** the blood sinus that surrounds the urethra of the male. Together with the corpora cavernosa, it forms the erectile tissue of the **\*penis**. It is expanded at the base of the penis to form the urethral bulb and at the tip to form the glans penis.

**corpus striatum** the part of the **\*basal ganglia** in the cerebral hemispheres of the brain consisting of the caudate nucleus and the lentiform nucleus.

**correlation** *n.* (in statistics) the degree of linear relationship between two or more **\*variables**. Pairs of observations can be plotted as a series of points on a **graph**. The **correlation coefficient** measures the extent to which the points on the resulting **scatter diagram** form a straight line. The correlation coefficient varies within the range of +1 (where an increase of one variable is associated with a corresponding increase in the other, and vice versa) to -1 (where an increase of one variable is associated with a corresponding decrease of the other); a coefficient of 0 indicates no linear relationship between the two variables. The statistical technique known as **multivariate analysis** can be used to investigate the relationships between several variables.

**Corrigan's pulse (collapsing pulse)** a type of pulse that has an exaggerated rise followed by a sudden fall. It is typical of **\*aortic regurgitation**. [Sir D. J. Corrigan (1802–80), Irish physician]

**Corrigan's sign** powerful pulsation of the carotid arteries causing ear movement and/or head nodding. It is a sign of **\*aortic regurgitation**. [Sir D. J.

Corrigan]

**cortex** *n.* (*pl.* **cortices**) the outer part of an organ, situated immediately beneath its capsule or outer membrane; for example, the **adrenal cortex** (*see* **ADRENAL GLANDS**), **renal cortex** (*see* **KIDNEY**), or **\*cerebral cortex**. — **cortical** *adj.*

**cortical evoked response audiometry (CERA)** an objective test of hearing that measures the electrical activity in the **\*cerebral cortex** following sound stimulation.

**cortical Lewy body disease** a disorder characterized by a combination of **\*parkinsonism** and **\*dementia**, which typically fluctuates. Visual hallucinations are common, and there is exquisite sensitivity to phenothiazine drugs. Abnormal proteins called **Lewy bodies** are found within the nerve cells of the cortex and the basal ganglia. It is the third most common cause of dementia (**dementia with Lewy bodies**) after **\*Alzheimer's disease** and vascular dementia.

**corticosteroid (corticoid)** *n.* any steroid hormone synthesized by the adrenal cortex. There are two main groups of corticosteroids. The **glucocorticoids** (e.g. **\*cortisol**, **\*cortisone**, and corticosterone) are essential for the utilization of carbohydrate, fat, and protein by the body and for a normal response to stress. Naturally occurring and synthetic glucocorticoids have very powerful anti-inflammatory effects and are used to treat conditions that involve inflammation. The **mineralocorticoids** (e.g. **\*aldosterone**) are necessary for the regulation of salt and water balance.

**corticosterone** *n.* a steroid hormone (*see* **CORTICOSTEROID**) synthesized and released in small amounts by the adrenal cortex.

**corticotrophin** *n.* *see* **ACTH**.

**corticotrophin-releasing hormone (CRH)** a peptide hypothalamic hormone (of 41 amino acids) stimulating the release of **\*ACTH** (adrenocorticotrophic hormone) from the anterior pituitary. Its own release is suppressed by a **\*negative feedback loop** involving cortisol, and its action is increased by antidiuretic hormone (*see* **VASOPRESSIN**) and **\*angiotensin II**. It can be administered intravenously as part of the **CRH test**, during which blood is

analysed at 15-minute intervals for one hour for the ACTH response, which is excessive in cases of primary adrenal failure and suppressed in cases of anterior **\*hypopituitarism**.

**cortisol** *n.* a steroid hormone: the major glucocorticoid synthesized and released by the human adrenal cortex (*see* **CORTICOSTEROID**). It is important for normal carbohydrate metabolism and for the normal response to any stress. *See also* **HYDROCORTISONE**.

**cortisone** *n.* a naturally occurring **\*corticosteroid** that is used mainly to treat deficiency of corticosteroid hormones in **\*Addison's disease** and following surgical removal of the adrenal glands. It is administered by mouth or injection and may cause serious side-effects such as stomach ulcers and bleeding, nervous and hormone disturbances, muscle and bone damage, and eye changes.

**cor triloculare** a rare congenital condition in which there are three instead of four chambers of the heart due to the presence of a single common ventricle. **\*Cyanosis** (blueness) is common. Most patients die in infancy.

**Corynebacterium** *n.* a genus of Gram-positive, mostly aerobic, nonmotile rodlike bacteria that frequently bear club-shaped swellings. Many species cause disease in humans, domestic animals, birds, and plants; some are found in dairy products. The species *C. diphtheriae* (**Klebs–Loeffler bacillus**) is the causative organism of **\*diphtheria**, producing a powerful **\*exotoxin** that is harmful to heart and nerve tissue. It occurs in one of three forms: *gravis*, *intermedius*, and *mitis*.

**coryza (cold in the head)** *n.* a catarrhal inflammation of the mucous membrane in the nose due to either a **\*cold** or **\*hay fever**. *See also* **CATARRH**.

**COSHH (control of substances hazardous to health)** (in occupational health) legislation and resulting regulations concerning the duties and responsibilities of employers and employees to ensure that **hazardous substances** used in a workplace (e.g. toxic chemicals in factories, anaesthetic gases in operating theatres) do not affect adversely the workforce or others.

**cost-** (**costo-**) *combining form denoting the ribs.* Example: **costectomy** (excision of).

**costal** *adj.* of or relating to the ribs.

**costal cartilage** a cartilage that connects a **\*rib** to the breastbone (**\*sternum**). The first seven ribs (true ribs) are directly connected to the sternum by individual costal cartilages. The next three ribs are indirectly connected to the sternum by three costal cartilages, each of which is connected to the one immediately above it.

**costalgia** *n.* pain localized to the ribs. This term is now rarely used.

**cost–benefit analysis** an analytical process for weighing up the possible losses (costs) and gains (benefits) of an action or policy, often in monetary or numerical form, and usually as a means of deciding between alternatives. In medicine, it is particularly associated with the setting of priorities in allocating limited health-care resources. Analysis may result in a cost–benefit ratio. *Compare* **RISK–BENEFIT ANALYSIS**. *See also* **CONSEQUENTIALISM**; **QUALITY OF LIFE**; **RATIONING**.

**costochondritis** *n.* a painful condition of the chest wall, caused by inflammation in the joints between ribs and cartilage, breastbone and cartilage, or breastbone and clavicles. It can be caused by strenuous or repetitive movements. The condition is usually shortlived and resolves without treatment. *Compare* **TIETZE’S SYNDROME**.

**cot death** *see* **SUDDEN INFANT DEATH SYNDROME**.

<https://www.lullabytrust.org.uk>

- Website of the Lullaby Trust (formerly the Foundation for the Study of Infant Deaths)

**co-trimoxazole** *n.* an antibacterial drug consisting of **sulfamethoxazole** (a **\*sulphonamide**) and **\*trimethoprim**, each of which potentiates (increases) the action of the other. Because of the severity of its side-effects, which are those of the sulphonamides, co-trimoxazole is now usually limited to treating **\*Pneumocystis** pneumonia, toxoplasmosis, and nocardiasis.

**cotton-wool spots** soft fluffy spots in the retina resulting from accumulations of **\*axoplasm** in the nerve-fibre layer of the retina. These may indicate diseases causing hypoxia (oxygen deficiency) in the nerve-fibre layer (e.g. diabetes, hypertension, connective-tissue disease, or AIDS).

**cotyledon** *n.* any of the major convex subdivisions of the mature **\*placenta**. Each cotyledon contains a major branch of the umbilical blood vessels, which branch further into the numerous villi that make up the surface of the cotyledon.

**cotyloid cavity** *see* **ACETABULUM**.

**couching** *n.* an operation for cataract in which the lens is pushed out of the pupil downwards and backwards into the jelly-like vitreous humour by a small knife inserted through the edge of the cornea. It was widely employed in ancient Hindu civilizations but developments in surgery and anaesthesia leave little place for it today.

**coughing** *n.* a form of violent exhalation by which irritant particles in the airways can be expelled. Stimulation of the cough reflexes results in the glottis being kept closed until a high expiratory pressure has built up, which is then suddenly released. Medical name: **tussis**.

**cough suppressant** *see* **ANTITUSSIVE**.

**coulomb** *n.* the **\*SI unit** of electric charge, equal to the quantity of electricity transferred by 1 ampere in 1 second. Symbol: C.

**counselling** *n.* **1.** a method of approaching psychological difficulties in adjustment that aims to help the client work out his own problems. The counsellor listens sympathetically, attempting to identify with the client, tries to clarify current problems, and sometimes gives advice. It involves less emphasis on insight and interpretation than does psychotherapy or psychoanalytic therapy. *See also* **CLIENT-CENTRED THERAPY**. **2.** *see* **GENETIC COUNSELLING**.

**counterextension** *n.* **\*traction** on one part of a limb, while the remainder of the limb is held steady: used particularly in the treatment of a fractured femur (thigh bone).

**counterirritant** *n.* an agent, such as methyl salicylate, that causes irritation when applied to the skin and is used in order to relieve more deep-seated pain or discomfort. —**counterirritation** *n.*

**countertraction** *n.* the use of an opposing force to balance that being applied during **\*traction**, when a strong continuous pull is applied, for example, to a limb so that broken bones can be kept in alignment during healing.

**coupling agents** items that help to improve contact between the two paddles of a manual **\*defibrillator** and the chest wall of the patient, thus reducing the **\*transthoracic impedance** and the risk of contact burns. The most common agents are **defibrillation gel pads**, thin pads of electrically conductive material placed between the patient's skin and the defibrillation paddles. The two pads must not touch during defibrillation or a short circuit will form between the paddles. Liquid gels can also be used, but there is a greater risk of short-circuiting as the gel can spread between the two paddles.

**couvelaire** *n.* the appearance of the uterus following a massive placental abruption (**\*abruptio placentae**) when blood has extravasated (leaked) through the **\*myometrium** to the subserosal surface of the uterus. The uterus is hard and tender and a bruised discoloration can be seen at the time of Caesarean section.

**covariate (covariable)** *n.* (in statistics) a continuous **\*variable** that is not part of the main experimental manipulation but has a statistical relationship with the dependent variable. For example, in a study of weight gain, age may be a significant covariate. The inclusion of covariates increases the power of the statistical test and minimizes the effect of **\*confounding** variables.

**cover-slip** *n.* an extremely thin square or circle of glass used to protect the upper surface of a preparation on a microscope slide.

**cover test** a test used to detect a squint. The observer looks at a target object, one eye at a time being covered. If the uncovered eye deviates to focus on the target, then a squint is confirmed. The movement can be up, down, sideways, or a combination, depending on the type of squint (*see STRABISMUS*).

**Cowper's glands (bulbourethral glands)** a pair of small glands that open into the urethra at the base of the penis. Their secretion contributes to the

seminal fluid, but less than that of the prostate gland or seminal vesicles. [W. Cowper (1660–1709), English surgeon]

**cowpox** *n.* a virus infection of cows' udders, transmitted to humans by direct contact, causing very mild symptoms similar to **\*smallpox**. An attack confers immunity to smallpox. Medical name: **vaccinia**.

**cox-** (**coxo-**) *combining form denoting the hip*. Example: **coxalgia** (pain in).

**coxa** *n.* (*pl.* **coxae**) **1.** the hip bone. **2.** the hip joint.

**Coxiella** *n.* a genus of rickettsiae that cause disease in animals and humans. They are transmitted to humans by inhalation and produce disease characterized by inflammation of the lungs, without a rash (*compare* **TYPHUS**). The single species, *C. burnetii*, causes **\*Q fever**.

**COX-2 inhibitor** any one of a group of anti-inflammatory drugs (*see* **NSAID**) that selectively block the action of the enzyme cyclo-oxygenase 2 (COX-2), which mediates the production of **\*prostaglandin** at sites of inflammation, especially in joints; they are less likely to inhibit COX-1, which controls the production of prostaglandin in the stomach (where it is involved in the production of protective mucus), and therefore less likely than nonselective NSAIDs to cause peptic bleeding or ulceration. COX-2 inhibitors are used in the treatment of arthritis, acute gout, and moderate or severe pain. They include **\*celecoxib** and **etoricoxib**. However, because their use is associated with an increased incidence of heart attack and stroke, COX-2 inhibitors should be taken only by those who are not at risk of developing these conditions and who have a high risk of developing peptic ulceration. Other side-effects include fluid retention (oedema), intestinal upset, dizziness, insomnia, and sore throat.

**Cox maze procedure** a cardiac surgical procedure performed to prevent atrial **\*fibrillation**. Multiple atrial incisions are made in a mazelike pattern. These incisions heal with scar tissue that does not conduct electricity, thus interrupting the abnormal electrical impulses that trigger atrial fibrillation. [J. Cox (21st century), US surgeon]

**Coxsackie virus (echovirus)** one of a group of RNA-containing viruses that are able to multiply in the gastrointestinal tract (*see* **ENTEROVIRUS**). About 30 different types exist. **Type A Coxsackie viruses** generally cause less

severe and less well-defined diseases, such as [\\*hand, foot, and mouth disease](#), although some cause meningitis and severe throat infections (*see* [HERPANGINA](#)). **Type B Coxsackie viruses** cause inflammation or degeneration of heart tissue, resulting in pericarditis or myocarditis, or brain tissue, producing meningitis or encephalitis. They can also attack the muscles of the chest wall, the bronchi, pancreas, thyroid, or conjunctiva and recent evidence suggests they may be implicated in diabetes in children and in motor neuron disease. *See also* [BORNHOLM DISEASE](#).

**CPAP** *see* [CONTINUOUS POSITIVE AIRWAYS PRESSURE](#).

**C-peptide** *n.* a peptide (so-called because of its C shape) formed when insulin is produced from its precursor molecule, proinsulin. It is secreted in equal molar amounts to insulin. However, as it remains detectable in the plasma much longer than insulin it can be more easily assayed as a marker of the degree of insulin secretion. This can be useful to assess the ability of the pancreas to secrete insulin, for example when trying to determine whether somebody has type 1 or type 2 diabetes or to distinguish an insulin-secreting tumour (an [\\*insulinoma](#)) from surreptitious insulin usage in somebody presenting with unexplained hypoglycaemia.

**CPR** *see* [CARDIOPULMONARY RESUSCITATION](#).

**CQC** *see* [CARE QUALITY COMMISSION](#).

**crab louse** *see* [PHTHIRUS](#).

**cradle** *n.* a framework of metal strips or other material that forms a cage over an injured part of the body of a patient lying in bed, to protect it from the pressure of the bedclothes.

**cradle cap** a common condition in young babies in which crusty white or yellow scales form a ‘cap’ on the scalp. It is treated by applying oil or using a special shampoo and usually resolves in the first year of life, although it may represent the start of seborrhoeic [\\*eczema](#).

**CRAFT screening test** a screening tool for young people under the age of 21 to identify alcohol and drug use. The first part consists of three questions about drug or alcohol use over the past year. Participants giving positive answers to two or more questions proceed to the second part (from which the

name derives), which contains six questions with the key words *car*, *relax*, *alone*, *family/friends*, *forget*, *trouble*, used to assess the need for further input.

**cramp** *n.* prolonged painful contraction of a muscle. It is sometimes caused by an imbalance of calcium and potassium in the body, but is more often a result of fatigue, imperfect posture, or stress. Spasm in the muscles making it impossible to perform a specific task but allowing the use of these muscles for any other movement is called **occupational cramp**. It most often affects the hand muscles for writing (**writer's cramp**), a form of *\*dystonia*.

**crani-** (**cranio-**) *combining form denoting the skull*. Example: **cranioplasty** (plastic surgery of).

**cranial nerves** the 12 pairs of nerves that arise directly from the brain and leave the skull through separate apertures; they are conventionally given Roman numbers, as follows: I *\*olfactory*; II *\*optic*; III *\*oculomotor*; IV *\*trochlear*; V *\*trigeminal*; VI *\*abducens*; VII *\*facial*; VIII *\*vestibulocochlear*; IX *\*glossopharyngeal*; X *\*vagus*; XI *\*accessory*; XII *\*hypoglossal*. Compare SPINAL NERVES.

**craniometry** *n.* the science of measuring the differences in size and shape of skulls.

**craniopagus (dicephalus)** *n.* *\*conjoined twins* united by their heads.

**craniopharyngioma** *n.* a brain tumour, situated above the *\*sella turcica*, that is derived from remnants of **Rathke's pouch**, the earliest detectable embryonic precursor of the pituitary gland. The patient may show raised intracranial pressure and *\*diabetes insipidus* due to reduced secretion of the hormone *\*vasopressin*. An X-ray of the skull typically shows calcification within the tumour and loss of the normal skull structure around the pituitary gland.

**craniostenosis** *n.* premature closing of the *\*sutures* and fontanelles between the cranial bones during development, resulting in the skull remaining abnormally small. Compare CRANIOSYNOSTOSIS.

**craniosynostosis** *n.* premature fusion of some of the cranial bones, usually before birth, so that the skull is unable to expand in certain directions to

assume its normal shape under the influence of the growing brain. Depending on which cranial *\*sutures* fuse early, the skull may become elongated from front to back, broad and short, peaked (**oxycephaly** or **turriccephaly**), or asymmetrical. Craniosynostosis is a feature of several related inherited disorders (see **ACROCEPHALOSYNDACTYLY**). Compare **CRANIOSTENOSIS**.

**craniotomy** *n.* **1.** surgical removal of a portion of the skull (cranium), performed to expose the brain and *\*meninges* for inspection or biopsy or to relieve excessive intracranial pressure (as in a subdural *\*haematoma*). **2.** surgical perforation of the skull of a dead fetus during difficult labour, so that delivery may continue. For both operations the instrument used is called a **craniotome**.

**cranium** *n.* the part of the skeleton that encloses the brain. It consists of eight bones connected together by immovable joints (see **SKULL**). —**cranial** *adj.*

**C-reactive protein (CRP)** a protein whose plasma concentrations are raised in infections and inflammatory states and in the presence of tissue damage or necrosis.

**cream** *n.* a preparation for use on the skin consisting of an emulsion of oil in water, which may or may not contain medication. It rubs into the skin easily and contains preservatives, which may be allergenic. Compare **OINTMENT**.

**creatinase (creatine kinase)** *n.* an enzyme involved in the metabolic breakdown of creatine to creatinine.

**creatine** *n.* a product of protein metabolism found in muscle. Its phosphate, **creatine phosphate (phosphocreatine, phosphagen)**, acts as a store of high-energy phosphate in muscle and serves to maintain adequate amounts of *\*ATP* (the source of energy for muscular contraction).

**creatine kinase** an enzyme involved in the metabolic breakdown of creatine to creatinine. Isomers of creatine kinase originate from brain and thyroid (BB), skeletal muscle (MM), and cardiac muscle (MB). Any damage to these tissues causes an increase of the isomer in the serum, which can be used in diagnosis, particularly of myocardial infarction.

**creatinine** *n.* a substance derived from creatine and creatine phosphate in muscle. Creatinine is excreted in the urine.

**creatinuria** *n.* an excess of the nitrogenous compound creatine in the urine.

**creeping eruption (larva migrans)** a skin disease caused either by larvae of certain nematode worms (e.g. *Ancylostoma braziliense*) normally parasitic in dogs and cats or by the maggots of certain flies (see **HYPODERMA**; **GASTEROPHILUS**). The larvae burrow within the skin tissues, their movements marked by long thin red lines that cause the patient intense irritation. The nematode infections are treated with albendazole, ivermectin, or tiabendazole; maggots can be surgically removed.

**cremasteric reflex** a superficial reflex in males elicited by stroking the inner side of the upper thigh with a sharp object. If the reflex is intact the scrotum on that side is pulled upwards as the cremaster muscle contracts. Absence or reduction of both cremasteric reflexes indicates an upper **\*motor neuron** lesion; absence of the reflex on one side suggests a lower motor neuron lesion at the level of the first lumbar spinal nerve.

**crenation** *n.* an abnormal appearance of red blood cells seen under a microscope, in which the normally smooth cell margins appear crinkly or irregular. Crenation may be a feature of certain blood disorders, but most commonly occurs as a result of prolonged storage of a blood specimen prior to preparation of a blood film. *See also* **BURR CELL**.

**Creon** *n.* *see* **PANCREATIC ENZYME REPLACEMENT THERAPY**.

**crepitation (rale)** *n.* a soft fine crackling sound heard in the lungs through the stethoscope. Crepitations are made either by air passages and alveoli (air sacs) opening up during inspiration or by air bubbling through fluid. They are not normally heard in healthy lungs.

**crepitus** *n.* **1.** a crackling sound or grating feeling produced by bone rubbing on bone or roughened cartilage, detected by palpation on movement of an arthritic joint. Crepitus in the knee joint is a common sign of **\*chondromalacia** patellae in the young and **\*osteoarthritis** in the elderly. **2.** a similar sound heard with a stethoscope over an inflamed lung when the patient breathes in. **3.** a similar sound heard over an inflamed extensor tendon in the hand in **\*scleroderma** caused by thickening of the skin, or over a tendon injured by repetitive use in de Quervain's **\*tendovaginitis**.

**crest** *n.* a ridge or linear protuberance, particularly on a bone. Examples include the crest of fibula and the iliac crest (of the ilium).

**CREST syndrome** a disease characterized by the association of *\*calcinosis*, Raynaud's phenomenon (*see* **RAYNAUD'S DISEASE**), (o)esophageal malfunction, sclerodactyly (tapering fingers), and *\*telangiectasia* (*see* **TELANGIECTASIS**). It represents a variant of *\*systemic sclerosis* and is also called **limited cutaneous systemic sclerosis**. It may be associated with severe pulmonary hypertension.

**cretinism** *n.* a syndrome of *\*dwarfism*, learning disabilities, and coarseness of the skin and facial features due to lack of thyroid hormone from birth (congenital *\*hypothyroidism*).

**Creutzfeldt–Jakob disease (CJD)** a rapidly progressive rare neurological disease, a form of human *\*spongiform encephalopathy* in which dementia progresses to death after a period of 3–12 months. There is no effective treatment. The causative agent is an abnormal *\*prion* protein that accumulates in the brain and causes widespread destruction of tissue. CJD typically affects middle-aged to elderly people. Some 15% of cases are due to a form of the disease that is inherited as an autosomal *\*dominant* trait but most cases are sporadic, susceptibility being genetically determined. A few cases of CJD are acquired: the agent is known to have been transmitted by tissue and organ transplantation and by human growth hormone injections, but the disease may take years to manifest itself. **Variant Creutzfeldt–Jakob disease (vCJD)** is the human form of bovine spongiform encephalopathy (BSE), which is most likely acquired by the ingestion of infected beef products. Patients are younger than those affected with sporadic CJD and present with psychiatric symptoms (e.g. depression, anxiety) and hypersensitivity to touch, which are followed after months by myoclonic jerks (*see* **MYOCLONUS**) and dementia. [H. G. Creutzfeldt (1885–1964) and A. M. Jakob (1884–1931), German psychiatrists]

**CRH** *see* **CORTICOTROPHIN-RELEASING HORMONE**.

**cribriform plate** *see* **ETHMOID BONE**.

**cricoid cartilage** the cartilage, shaped like a signet ring, that forms part of the anterior and lateral walls and most of the posterior wall of the *\*larynx*.

**cricoid pressure** a technique in which a trained assistant presses downwards on the **\*cricoid cartilage** of a supine patient to aid endotracheal **\*intubation**.

**cricothyroid membrane** the fibrous tissue in the anterior aspect of the neck between the lower border of the **\*thyroid cartilage** (the ‘Adam’s apple’) and the upper border of the **\*cricoid cartilage**, lying immediately below it. It is the site where certain emergency airway devices can be inserted.

**cricothyroidotomy** *n.* a technique for obtaining an emergency airway through the **\*cricothyroid membrane** when standard airway techniques have failed. There are two main techniques. In **needle cricothyroidotomy**, a large-bore intravenous cannula is inserted directly through the membrane. Ventilation by this technique can only be through a high-pressure system, must only be performed by trained personnel, and must only continue for a maximum of 45 minutes. Damage to the lungs can ensue. In **surgical cricothyroidotomy**, a surgical hole is made in the membrane and a cuffed tube, similar to a short endotracheal tube (see **INTUBATION**), is inserted directly. This affords much better airway protection.

**cri-du-chat syndrome** a congenital condition of severe learning disabilities associated with an abnormal facial appearance, spasticity, and a characteristic catlike cry in infancy. It results from a chromosomal abnormality in which there is a loss (**\*deletion**) of part of the short arm of chromosome no. 5.

**Crigler–Najjar syndrome** a rare genetic disease in which the liver enzyme glucuronyl transferase, responsible for dealing with bilirubin, is absent. A large amount of unconjugated bilirubin accumulates in the blood leading to refractory jaundice in early childhood. The definitive treatment is a liver transplant; if left untreated, life expectancy is usually less than two years. [J. F. Crigler and V. A. Najjar (20th century), US paediatricians]

**Crimean Congo haemorrhagic fever** a disease caused by bunyaviruses that has occurred in the former USSR, the Middle East, and Africa. It causes bleeding into the intestines, kidneys, genitals, and mouth with up to 50% mortality. The virus is spread by various types of tick from wild animals and birds to domestic animals (especially goats and cattle) and thus to humans.

**crisantaspase** *n.* see **ASPARAGINASE**.

**crisis** *n.* **1.** the turning point of a disease, after which the patient either improves or deteriorates. Since the advent of antibiotics, infections seldom reach the point of crisis. **2.** the occurrence of sudden severe pain in certain diseases. *See also* **DIETL'S CRISIS**.

**crisis resolution and home treatment team (CRHT)** (in psychiatry) a multidisciplinary team in psychiatric services specialized in the treatment of severely mentally ill patients in their home environment. An additional remit of CRHTs is to try and avoid acute hospital admissions.

**crista** *n.* (*pl. cristae*) **1.** the sensory structure within the ampulla of a **\*semicircular canal** within the inner ear (see illustration). The cristae respond to changes in the rate of movement of the head, being activated by pressure from the fluid in the semicircular canals. **2.** one of the infoldings of the inner membrane of a **\*mitochondrion**. **3.** any anatomical structure resembling a crest.

**A crista.**

**critical incident 1.** an event or episode that deviates from the expected or desired course and could have potentially negative effects for patient care or safety. Related terms include 'significant adverse event'. Such episodes may inform **\*reflective practice** and in the NHS should be reported. **2.** in research, an incident that defines an importantly altered outcome for one group of participants compared to others.

**critical realism** a philosophical approach to science and the social sciences that explores the difference between physical reality and human perceptions and experiences. It has been increasingly influential in medical sociology since the 1990s.

**Crohn's disease** a condition in which segments of the gastrointestinal tract become inflamed, thickened, ulcerated, and scarred. It can affect any part of the tract from mouth to anus; common areas affected are the small bowel and colon. It commonly affects the terminal ileum and may mimic acute **\*appendicitis**. The main symptoms are abdominal pain, diarrhoea, tiredness, and loss of weight. Longstanding poorly controlled Crohn's disease may predispose to **\*malabsorption**, strictures, and intestinal obstruction. **\*Fistulae** around the anus, between adjacent loops of intestine, or from intestine to skin, bladder, etc., may complicate Crohn's disease. The cause is unknown, but various environmental and genetic factors are thought to be involved. Treatment includes aminosalicylates, corticosteroids, immunosuppressant drugs, monoclonal antibodies, antibiotics, dietary modification, or (in many cases) surgical correction or removal of the affected part of the intestine. [B. Crohn (1884–1983), US physician]

**cromoglicate (sodium cromoglicate, cromoglycate)** *n.* a drug thought to prevent the release of histamine from mast cells. It is used to prevent asthma attacks and hay fever and to treat other allergic conditions, including allergic conjunctivitis and food allergies.

**CROS hearing aid** *see* **CONTRALATERAL-ROUTING-OF-SIGNAL HEARING AID**.

**crossbite** *n.* a type of oral misalignment in which some or all of the lower teeth close outside the upper teeth during normal closure.

**cross-dressing** *n. see* **TRANSVESTISM**.

**crossing over** (in genetics) the exchange of sections of chromatids that occurs between pairs of homologous chromosomes, which results in the recombination of genetic material. It occurs during **\*meiosis** at a **\*chiasma**.

**cross-over trial** *see* **INTERVENTION STUDY**.

**cross-sectional imaging** any technique that produces an image in the form of a section through the body with the structures cut across. The main techniques are \*ultrasonography, \*computerized tomography, \*magnetic resonance imaging, and some \*nuclear medicine techniques (see POSITRON EMISSION TOMOGRAPHY; SPECT SCANNING). If a series of thin-section images is stacked they can be ‘cut’ through to show other planes or allow reconstruction of three-dimensional images.

**cross-sectional study** the collection and analysis of information relating to persons in a population or group at a defined point in time, with particular reference to their disease status, individual characteristics, and exposure to factors thought likely to predispose to disease. Compare LONGITUDINAL STUDY.

**crotamiton** *n.* a drug that is used to relieve itching, including that associated with scabies. It is applied to the skin and sometimes causes reddening and hypersensitivity reactions.

**croup** *n.* acute inflammation and obstruction of the respiratory tract, involving the larynx and the main air passages (trachea and bronchi), in young children (usually aged between six months and three years). The usual cause is a virus infection but bacterial secondary infection can occur. The symptoms are those of \*laryngitis, accompanied by signs of obstruction – harsh difficult breathing (see STRIDOR), a characteristic barking cough, a rising pulse rate, restlessness, and \*cyanosis. Treatment is by reassurance and humidification of the inspired air. In severe cases the obstruction may require treatment by steroid nebulizers, \*intubation, or \*tracheostomy. See also EPIGLOTTITIS.

**Crouzon syndrome (craniofacial dysostosis)** a genetic disorder characterized by premature fusion of the skull sutures, leading to distortion in the shape of the head. It is a generalized form of \*craniosynostosis, with a wide skull, high forehead, widely spaced eyes (ocular \*hypertelorism), and \*exophthalmos. See also APERT SYNDROME. [O. Crouzon (1874–1938), French neurologist]

**crown** *n.* 1. the part of a tooth normally visible in the mouth and usually covered by enamel. 2. a dental \*restoration that covers most or all of the

natural crown of a tooth. It may be made of porcelain (sometimes bonded to a metal substructure), gold, a combination of these, or less commonly other materials. Most crowns are like thimbles and are custom made to fit over a trimmed-down tooth. Preformed metal crowns may be used on primary teeth. A **post crown** is used to restore a tooth when insufficient of the natural crown remains. A post is inserted into the root and the missing centre of the tooth is built up as a core; over it is fitted a thimble-like crown to restore the natural shape of the tooth. **\*Root canal treatment** is required before a post crown can be made.

**crowning** *n.* **1.** the stage of labour when the upper part of the infant's head is encircled by, and just passing through, the vaginal opening. **2.** (in dentistry) the technique of preparing and fitting a tooth with an artificial **\*crown**.

**crown–rump length (CRL)** the longest measurement of the fetus from end to end. Measurement of the CRL of the embryo in the first trimester has been shown to be the most accurate parameter for assessment of gestational age; the measurement is less accurate at the end of the first trimester because of fetal flexion.

**CRP** *see* **C-REACTIVE PROTEIN**.

**CRPS** *see* **COMPLEX REGIONAL PAIN SYNDROME**.

**CRT** *see* **CARDIAC RESYNCHRONIZATION THERAPY**.

**cruciate ligaments** a pair (anterior and posterior) of ligaments inside each knee joint, which help to prevent excessive anteroposterior glide. Damage to the cruciate ligaments is a common **\*sports injury**, especially in football players.

**crude rate** the total number of events (e.g. cases of lung cancer) expressed as a rate per 1000 population. When factors such as age structure or sex of populations can significantly affect the rates (as in **\*mortality** or **\*morbidity** rates) it is more meaningful to compare age/sex specific rates using one or more age groups of a designated sex (e.g. lung cancer in males aged 55–64 years). More complex calculations, which take account of the age and sex structure of a population as a whole, can produce **\*standardized rates** and **\*standardized mortality ratios** (SMR).

**cruising** *n.* (in child development) taking steps while holding onto furniture for support. At first, the toddler probably faces the furniture and shuffles sideways. Cruising usually begins in the 9th month, but can begin as early as 7 months and as late as 12 months. Babies generally progress from sitting to crawling to supported standing to cruising. Regardless of developmental order, cruising always comes after supported standing and before unsupported walking.

**crural** *adj.* **1.** relating to the thigh or leg. **2.** relating to the crura cerebri (*see* CRUS).

**crus** *n.* (*pl.* **crura**) an elongated process or part of a structure. The **crus cerebri** is one of two symmetrical nerve tracts situated between the medulla oblongata and the cerebral hemispheres.

**crush syndrome** *see* MYOGLOBINURIC ACUTE RENAL FAILURE.

**cry-** (**cryo-**) *combining form denoting cold.*

**cryaesthesia** *n.* **1.** exceptional sensitivity to low temperature. **2.** a sensation of coldness.

**cryoablation** *n.* an **\*ablation** technique in which extreme cold is used to destroy tumour or abnormal tissue. Nitrogen or argon gas is passed through the ablation probe to freeze the tissue around it. The technique is mostly used to destroy abnormal conducting tissue in the heart, especially abnormal cells around the pulmonary veins as they enter the left atrium in patients with atrial **\*fibrillation**. However, it is also used for kidney, prostate, and bone tumours. **\*Radiofrequency ablation** is an alternative approach.

**cryoglobulin** *n.* an abnormal protein – an **\*immunoglobulin** (*see* PARAPROTEIN) – that may be present in the blood in certain diseases. Cryoglobulins become insoluble at low temperatures, leading to obstruction of small blood vessels in the fingers and toes in cold weather and producing a characteristic rash. The presence of cryoglobulins (**cryoglobulinaemia**) may be a feature of a variety of diseases, including **\*macroglobulinaemia**, systemic **\*lupus erythematosus**, and certain infections.

**cryoprecipitate** *n.* a precipitate produced by freezing and thawing under controlled conditions. An example of a cryoprecipitate is the residue

obtained from fresh frozen blood plasma that has been thawed at 4°C. This residue is extremely rich in a clotting factor, Factor VIII (antihaemophilic factor), and is used in the control of bleeding in *\*haemophilia*.

**cryopreservation** *n.* preservation of tissues by freezing. Cryopreservation of embryos, egg cells, or sperm may be employed as part of *\*in vitro fertilization* procedures, for example if there are medical reasons for delaying the pregnancy. *See also* VITRIFICATION.

**cryoprobe** *n.* *see* CRYOSURGERY.

**cryoretinopexy** *n.* the use of extreme cold to freeze areas of weak or torn retina in order to cause scarring and seal breaks. It is used in *\*cryosurgery* for *\*retinal detachment* and also in certain other ischaemic conditions of the retina (e.g. diabetic retinopathy).

**cryostat** *n.* **1.** a chamber in which frozen tissue is sectioned with a *\*microtome*. **2.** a device for maintaining a specific low temperature.

**cryosurgery** *n.* the use of extreme cold in a localized part of the body to freeze and destroy unwanted tissues. Cryosurgery is usually undertaken with an instrument called a **cryoprobe**, which has a fine tip cooled by allowing carbon dioxide or nitrous oxide gas to expand within it. Cryosurgery is commonly used for the treatment of retinal detachment (*see* CRYORETINOPEXY), the destruction of certain bone tumours, and the obliteration of skin blemishes.

**cryotherapy** *n.* the destruction of diseased or unwanted tissue based on freezing. For example, prostate cryotherapy involves two alternate freeze-thaw cycles using specialized needles introduced into the prostate through the perineum to destroy cancer cells, either after failed radiotherapy or as a primary treatment. Freezing is performed by the infusion of argon gas through the needles and thawing by the infusion of helium. *See also* CYCLOCRYOTHERAPY; CRYOSURGERY; HYPOTHERMIA.

**crypt** *n.* a small sac, follicle, or cavity; for example, the crypts of Lieberkühn (*see* LIEBERKÜHN'S GLANDS), which are intestinal glands.

**crypt-** (**crypto-**) *combining form denoting* concealed. Example: **cryptogenic** (of unknown origin).

**cryptococcosis (torulosis)** *n.* a disease of worldwide distribution, but recognized mainly in the USA, caused by the fungus *Cryptococcus neoformans*. The fungus attacks the lung, resulting in a tumour-like solid mass (**toruloma**), but produces few or no symptoms referable to the lungs. It may spread to the brain, leading to meningitis; this may occur as an opportunistic infection in those suffering from AIDS. The condition responds well to treatment with **\*amphotericin**.

**Cryptococcus** *n.* a genus of unicellular yeastlike fungi that cause disease in humans. They are found in soil (particularly when enriched with pigeon droppings), and they are common in pigeon roosts and nests. The species *C. neoformans* causes **\*cryptococcosis**.

**cryptomenorrhoea** *n.* severe cyclical abdominal pain in association with **\*amenorrhoea**, usually about a year after the expected onset of menstruation and usually due to an **\*imperforate** hymen. On parting the labia, a bulging blue membrane is seen above the hymen and a pelvic mass is felt on examination. Treatment is by incision of the membrane.

**cryptophthalmos** *n.* apparent absence of the eyes due to failure of normal eyelid formation during embryonic development, resulting in absence of the opening between the upper and lower eyelids.

**cryptorchidism (cryptorchism)** *n.* the condition in which the testes fail to descend into the scrotum and are retained within the abdomen or inguinal canal. The operation of **\*orchidopexy** is necessary to bring the testes into the scrotum, ideally before the age of two years, in order to allow subsequent normal development; it is thought that the higher temperature in the abdomen interferes with sperm production. —**cryptorchid** *adj., n.*

**cryptosporidiosis** *n.* an intestinal infection of mammals and birds caused by parasitic protozoa of the genus *Cryptosporidium*, which is usually transmitted to humans via farm animals. Ingestion of water or milk contaminated with infective oocysts results in severe diarrhoea and abdominal cramps, caused by release of a toxin. Most patients recover in 7–14 days, but the disease can persist in the immunocompromised (including AIDS patients), the elderly, and young children.

**CSF** 1. *see* CEREBROSPINAL FLUID. 2. *see* COLONY-STIMULATING FACTOR.

**CS gas** a powerful incapacitating gas used in warfare and riot control. The sufferer experiences a burning sensation in the eyes, difficulty in breathing, tightness of the chest, nausea, vomiting, and streaming from the eyes and nose. In confined spaces the gas can prove fatal.

**CSOM** chronic suppurative otitis media (*see* OTITIS).

**CT** *see* COMPUTERIZED TOMOGRAPHY.

**CTA** computerized tomographic *\*angiography*.

**CTO** *see* CHRONIC TOTAL OCCLUSION.

**CTPA** computerized tomographic pulmonary angiography: a modification of computerized tomographic *\*angiography* in which the computer software optimizes the view of the pulmonary arteries. Also known as SVCT (spiral volumetric computerized tomography), it has become a useful tool for the diagnosis of pulmonary embolism.

**CTU** CT *\*urography*.

**cubital** *adj.* relating to the elbow or forearm; for example the **cubital fossa** is the depression at the front of the elbow.

**cuboid bone** the outer bone of the *\*tarsus*, which articulates with the fourth and fifth metatarsal bones in front and with the calcaneus (heel bone) behind.

**cui bono?** (Latin) literally, ‘to whom (is it) a benefit?’. This question is often considered to be at the heart of difficult questions in medical *\*ethics* (e.g. the use of *\*extraordinary* means to prolong life).

**cuirass ventilator** *see* VENTILATOR.

**culdoplasty (McCall culdoplasty)** *n.* a surgical procedure to correct a *\*vault prolapse* after hysterectomy using sutures to suspend the vaginal vault at the origin of the uterosacral ligaments (which support the vagina) and to close off the *\*pouch* of Douglas.

**Culex** *n.* a genus of mosquitoes, worldwide in distribution, of which there are some 600 species. Certain species are important as vectors of filariasis (*see also* **WUCHERERIA**) and viral encephalitis.

**culicide** *n.* an agent that destroys mosquitoes or gnats.

**Cullen sign** a bluish bruiselike appearance around the umbilicus due to bleeding into the peritoneum. Causes include a ruptured ectopic pregnancy and acute **\*pancreatitis**. [T. S. Cullen (1868–1953), US gynaecologist]

**culmen** *n.* an area of the upper surface of the **\*cerebellum**, anterior to the declive and posterior to the central lobule and separated from them by deep fissures.

**culture 1.** *n.* a population of microorganisms, usually bacteria, grown in a solid or liquid laboratory medium (**culture medium**), which is usually **\*agar**, broth, or **\*gelatin**. A **pure culture** consists of a single bacterial species. A **stab culture** is a bacterial culture growing in a plug of solid medium within a bottle (or tube); the medium is inoculated by ‘stabbing’ it with a bacteria-coated straight wire. A **stock culture** is a permanent bacterial culture, from which subcultures are made. *See also* **TISSUE CULTURE**. **2.** *vb.* to grow bacteria or other microorganisms in cultures.

**cumulative action** the toxic effects of a drug produced by repeated administration of small doses at intervals that are not long enough for it to be either broken down or excreted by the body.

**cumulus oophoricus** a cluster of follicle cells that surround a freshly ovulated ovum. By increasing the effective size of the ovum they may assist its entrance into the end of the Fallopian tube. They are dispersed at fertilization by the contents of the **\*acrosome**.

**cuneiform bones** three bones in the **\*tarsus** – the **lateral** (external), **intermediate** (middle), and **medial** (internal) cuneiform bones – that articulate respectively with the first, second, and third metatarsal bones in front. All three bones articulate with the navicular bone behind.

**cuneus** *n.* a wedge-shaped area of **\*cerebral cortex** that forms the inner surface of the occipital lobe.

**Cuniculus** *n.* a genus of large forest-dwelling rodents, the pacas or spotted cavies, found in South and Central America. In Brazil these animals are a natural reservoir of the parasite *Leishmania braziliensis*, which causes espundia (see **LEISHMANIASIS**).

**cupola** *n.* **1.** the small dome at the end of the cochlea. **2.** any of several dome-shaped anatomical structures.

**cupping** *n.* the traditional Chinese practice of applying a heated cup to the skin and allowing it to cool, which causes swelling of the tissues beneath and an increase in the flow of blood in the area. This is thought to draw out harmful excess blood from diseased organs nearby and so promote healing. In **wet cupping** the skin is previously cut, so that blood will flow into the cup and can be removed.

**cupula** *n.* a small dome-shaped structure consisting of sensory hairs embedded in gelatinous material, forming part of a **\*crista** in the ampullae of the semicircular canals of the ear.

**cupulolith** *n.* a particle derived from **\*otoliths** in the **\*utricle** of the inner ear, displaced from its normal site and attached to the **\*cupula** within the ampullary portion of one of the semicircular canals. Cupuloliths are implicated in **\*benign paroxysmal positional vertigo**.

**curare** *n.* an extract from the bark of South American trees (*Strychnos* and *Chondodendron* species) that relaxes and paralyzes voluntary muscle. Used for centuries as an arrow poison by South American Indians, curare was formerly employed to control the muscle spasms of tetanus and as a muscle relaxant in surgical operations.

**curettage** *n.* the scraping of the skin or the internal surface of an organ or body cavity by means of a spoon-shaped instrument (**curette**), usually to remove diseased tissue or to obtain a specimen for diagnostic purposes (see also **DILATATION AND CURETTAGE**). Curettage of the skin is combined with cauterization; it may be used for the removal of **\*basal cell carcinoma**, seborrhoeic **\*keratoses**, etc., and usually causes little scarring.

**curette** *n.* a spoon-shaped instrument for scraping tissue from a cavity (see **CURETTAGE**; **DILATATION AND CURETTAGE**).

**curie** *n.* a former unit for expressing the activity of a radioactive substance. It has been replaced by the **\*becquerel**. Symbol: Ci.

**Curling's ulcers** *see* **STRESS ULCERS**. [T. B. Curling (1811–88), British surgeon]

**Curschmann's spirals** elongated **\*casts** of the smaller bronchi, which are coughed up in bronchial asthma. They unroll to a length of 2 cm or more and have a central core ensheathed in mucus and cell debris. [H. Curschmann (1846–1910), German physician]

**Cushing's syndrome** the condition resulting from excess amounts of **\*corticosteroid** hormones in the body. Symptoms include weight gain, reddening of the face and neck, excess growth of body and facial hair, raised blood pressure, loss of mineral from the bones (osteoporosis), raised blood glucose levels, and sometimes mental disturbances. The syndrome may be due to overstimulation of the adrenal glands by excessive amounts of the hormone ACTH, secreted either by a tumour of the pituitary gland (**Cushing's disease**) or by a malignant tumour in the lung or elsewhere. Other causes include a benign or malignant tumour of the adrenal gland(s), resulting in excess activity of the gland, and prolonged therapy with high doses of corticosteroid drugs. [H. W. Cushing (1869–1939), US surgeon]

**Cushing's ulcers** *see* **STRESS ULCERS**. [H. W. Cushing]

**cuspid** *n.* **1.** any of the cone-shaped prominences on teeth, especially the molars and premolars. **2.** a pocket or fold of the membrane (endocardium) lining the heart or of the layer of the wall of a vein, several of which form a **\*valve**. When the blood flows backwards the cusps fill up and become distended, so closing the valve.

**cutaneous** *adj.* relating to the skin.

**cutaneous T-cell lymphoma** a group of lymphomas in which abnormal T **\*lymphocytes** are concentrated in the skin. The most common form is **\*mycosis fungoides**.

**cuticle** *n.* **1.** the **\*epidermis** of the skin. **2.** a layer of solid or semisolid material that is secreted by and covers an **\*epithelium**. **3.** a layer of cells, such as the outer layer of cells in a hair.

**cutis** *n.* see SKIN.

**CVP** see CENTRAL VENOUS PRESSURE.

**CVS** see CHORIONIC VILLUS SAMPLING.

**cyan- (cyano-)** *combining form denoting* blue.

**cyanide** *n.* any of the notoriously poisonous salts of hydrocyanic acid. Cyanides combine with and render inactive the enzymes of the tissues responsible for cellular respiration, and therefore they kill extremely quickly; unconsciousness is followed by convulsions and death. Hydrogen cyanide vapour is fatal in less than a minute when inhaled. Sodium or potassium cyanide taken by mouth may also kill within minutes. Prompt treatment with sodium nitrite and sodium thiosulphate or dicobalt \***edetate** may save life. Cyanides give off a smell of bitter almonds.

**cyanocobalamin** *n.* see VITAMIN B<sub>12</sub>.

**cyanopsia** *n.* a condition in which everything looks bluish.

**cyanosis** *n.* a bluish discoloration of the skin and mucous membranes resulting from an inadequate amount of oxygen in the blood. Cyanosis is associated with heart failure, lung diseases, the breathing of oxygen-deficient atmospheres, and asphyxia. Cyanosis is also seen in \***blue babies**, because of congenital heart defects. —**cyanotic** *adj.*

**cyberknife** *n.* a frameless stereotactic radiotherapy system produced from a small \***linear accelerator**, which has a robotic arm that allows the beam to be directed from any direction, and which monitors movement of implanted markers to deliver real-time \***image-guided radiotherapy**.

**cybernetics** *n.* the science of communication processes and automatic control systems in both machines and living things: a study linking the working of the brain and nervous system with the functioning of computers and automated feedback devices. *See also* BIONICS.

**cycl- (cyclo-)** *combining form denoting* **1.** cycle or cyclic. **2.** the ciliary body. Example: **cyclectomy** (excision of).

**cyclamate** *n.* either of two compounds, sodium or calcium cyclamate, that are thirty times as sweet as sugar and, unlike saccharin, stable to heat. Cyclamates were used as sweetening agents in the food industry until 1969, when their use was banned because they were suspected of causing cancer.

**cyclitis** *n.* inflammation of the **\*ciliary body** of the eye (see **UVEITIS**). See also **FUCHS' HETEROCHROMIC CYCLITIS**.

**cyclizine** *n.* a drug with **\*antihistamine** properties, used to prevent and relieve nausea and vomiting in motion sickness, vertigo, and disorders of the inner ear. Common side-effects are drowsiness and dizziness.

**cycloablation** *n.* the destruction of part of the **\*ciliary body** of the eye to reduce the production of aqueous humour and hence reduce intraocular pressure. This technique is used in the treatment of advanced glaucoma resistant to other forms of treatment.

**cyclocryotherapy** *n.* the destruction of part of the **\*ciliary body** (see **CYCLOABLATION**) by freezing. It is used to reduce intraocular pressure in the control of glaucoma.

**cyclodialysis** *n.* separation of the **\*ciliary body** from its attachment to the sclera, producing a cleft between the two (**cyclodialysis cleft**). This may be the result of trauma or it may be performed as part of an operation in the treatment of glaucoma.

**cyclopenthiiazide** *n.* a **\*diuretic** used to treat fluid retention (oedema), high blood pressure (hypertension), and heart failure. It may cause a fall in blood pressure on standing up and reduced blood potassium levels.

**cyclopentolate** *n.* a drug, similar to **\*atropine**, that is used in eye drops to paralyse the ciliary muscles and dilate the pupil for eye examinations.

**cyclophoria** *n.* a type of squint (see **STRABISMUS**) in which the eye, when tested, tends to rotate slightly clockwise or anticlockwise.

**cyclophosphamide** *n.* an **\*alkylating agent** used to treat a variety of cancers, including chronic lymphocytic leukaemia, lymphomas, and solid tumours, often in combination with other **\*cytotoxic drugs**. It also has **\*immunosuppressant** properties and is used in treating conditions, notably

rheumatoid arthritis, requiring a reduced immune response. Common side-effects are nausea, vomiting, and – particularly at high doses – hair loss. *See also* [MESNA](#).

**cyclophotoablation** *n.* the use of light or lasers to destroy the [\\*ciliary body](#) of the eye in order to reduce production of aqueous humour and hence reduce intraocular pressure. It is used in the treatment of glaucoma.

**cycloplegia** *n.* paralysis of the ciliary muscle of the eye (*see* [CILIARY BODY](#)). This causes inability to alter the focus of the eye and is usually accompanied by paralysis of the muscles of the iris, resulting in fixed dilation of the pupil (**mydriasis**). It is induced by the use of atropine or similar drugs in order to inactivate the muscle in cases of inflammation of the iris and ciliary body and to objectively assess the refractive status of the eye, particularly in children. It may also occur after injuries to the eye.

**cycloserine** *n.* an [\\*antibiotic](#), active against a wide range of bacteria, that may be used as supporting treatment in resistant tuberculosis. Side-effects, which can be severe, include headache, dizziness, drowsiness, convulsions, and mental confusion.

**cyclosporin** *n.* *see* [CICLOSPORIN](#).

**cyclothymia (cyclothymic disorder)** *n.* the occurrence of mood swings from cheerfulness to misery. These fluctuations are not as great as those of [\\*bipolar affective disorder](#). They may represent a personality trait for which [\\*psychotherapy](#) is sometimes helpful.

**cyclotron** *n.* a machine in which charged particles following a spiral path within a magnetic field are accelerated by an alternating electric field. It produces very high-energy charged particles for radiotherapy ([\\*proton therapy](#)), which has been used in the treatment of certain cancers, particularly of the eye. Cyclotrons are used in the preparation of radioisotopes for imaging, particularly those for PET scanning (*see* [POSITRON EMISSION TOMOGRAPHY](#)).

**cyesis** *n.* *see* [PREGNANCY](#).

**cylinder** *n.* (in optometry) *see* [ASTIGMATISM](#).

**cyproheptadine** *n.* a potent **\*antihistamine** used to treat allergies, such as hay fever and urticaria. Drowsiness is a common side-effect.

**cyproterone (cyproterone acetate)** *n.* a steroid drug that inhibits the effects of male sex hormones (*see* **ANTI-ANDROGEN**). It is used to treat hypersexuality disorders and advanced prostate cancer in men; combined with ethinylestradiol as **co-cyprindiol**, it is used to treat acne and hirsutism in women. Common side-effects include tiredness, loss of strength, inhibition of sperm formation, infertility, and breast enlargement (gynaecomastia). Because of a risk of liver damage, liver function tests should be carried out before and during treatment.

**cyrtometer** *n.* a device for measuring the shape of the chest and its movements during breathing.

**cyst** *n.* **1.** an abnormal sac or closed cavity lined with **\*epithelium** and filled with liquid or semisolid matter. There are many varieties of cysts occurring in different parts of the body. **Retention cysts** arise when the outlet of a glandular duct is blocked, as in **\*sebaceous cysts**. Some cysts are congenital, due to abnormal embryonic development; for example, **\*dermoid cysts**. Others are tumours containing cells that secrete mucus or other substances, and another type of cyst is formed by parasites in the body (*see* **HYDATID**). Cysts may occur in the jaws: a **periapical cyst** occurs at the apex of a tooth, a **dentigerous cyst** occurs around the crown of an unerupted tooth, and an **eruption cyst** forms over an erupting tooth. *See also* **FIMBRIAL CYST**; **OVARIAN CYST**; **PSEUDOCYST**. **2.** a dormant stage produced during the life cycle of certain protozoan parasites of the alimentary canal, including **\*Giardia** and **\*Entamoeba**. Cysts, passed out in the faeces, have tough outer coats that protect the parasites from unfavourable conditions. The parasites emerge from their cysts when they are eaten by a new host. **3.** a structure formed by and surrounding the larvae of certain parasitic worms.

**cyst- (cysto-)** *combining form denoting* **1.** a bladder, especially the urinary bladder. Example: **cystoplasty** (plastic surgery of). **2.** a cyst.

**cystadenoma** *n.* an **\*adenoma** showing a cystic structure.

**cystalgia** *n.* pain in the urinary bladder. This is common in **\*cystitis** and when there are stones in the bladder and is occasionally present in bladder

cancer. Treatment is directed to the underlying cause.

**cystectomy** *n.* surgical removal of the urinary bladder. This is necessary in the treatment of certain bladder conditions, notably cancer, and necessitates subsequent **\*urinary diversion**. The ureters draining the urine from the kidneys are reimplanted into an isolated segment of intestine (usually the ileum), which is brought to the skin surface as a spout (see **ILEAL CONDUIT**). Alternatively, in **bladder replacement**, a segment of ileum or colon is reconstructed to form a pouch (the **Studer pouch** is created from approximately 50 cm of ileum), which is anastomosed to the urethra and acts as a reservoir for the urine. Emptying may be achieved by abdominal straining or **\*intermittent self-catheterization**.

**cysteine** *n.* a sulphur-containing **\*amino acid** that is an important constituent of many enzymes. The disulphide (S–S) links between adjacent cysteine molecules in polypeptide chains contribute to the three-dimensional molecular structure of proteins.

**cystic** *adj.* **1.** of, relating to, or characterized by cysts. **2.** of or relating to the gall bladder or urinary bladder.

**cystic duct** *see* **BILE DUCT**.

**cysticercosis** *n.* a disease caused by the presence of tapeworm larvae (see **CYSTICERCUS**) of the species **\*Taenia solium** in any of the body tissues. Humans become infected on ingesting tapeworm eggs in contaminated food or drink. The presence of cysticerci in the muscles causes pain and weakness; in the brain the symptoms are more serious, including mental deterioration, paralysis, giddiness, epileptic attacks, and convulsions, which may be fatal. There is no specific treatment for this cosmopolitan disease although surgical removal of cysticerci may be necessary to relieve pressure on the brain.

**cysticercus (bladderworm)** *n.* a larval stage of some **\*tapeworms** in which the scolex and neck are invaginated into a large fluid-filled cyst. The cysts develop in the muscles or brain of the host following ingestion of tapeworm eggs. *See* **CYSTICERCOSIS**.

**cystic fibrosis (fibrocystic disease of the pancreas, mucoviscidosis)** a hereditary disease affecting cells of the exocrine glands (including mucus-secreting glands, sweat glands, and others). The faulty gene responsible for the most common form of the disease has been identified as lying on chromosome no. 7 and is recessive, i.e. both parents of the patient can be *\*carriers* without being affected by the disease. Affected individuals have abnormalities in a protein, **cystic fibrosis transmembrane conductance regulator (CFTR)**, that enables the transport of chloride ions across cell membranes: this results in the production of thick mucus, which obstructs the intestinal glands (causing meconium *\*ileus* in newborn babies), pancreas (causing deficiency of pancreatic enzymes resulting in *\*malabsorption* and *\*failure to thrive*), and bronchi (causing *\*bronchiectasis*). Respiratory infections, which may be severe, are a common complication. Common agents include *\*Haemophilus*, *\*Pseudomonas*, *\*Staphylococcus*, and *Burkholderia cepacia*. The sweat contains excessive amounts of sodium and chloride, which is an aid to diagnosis.

Treatment consists of minimizing the effects of the disease by administration of pancreatic enzymes and physiotherapy for the lungs and by preventing and combating secondary infection. Sputum viscosity can be reduced by nebulized recombinant human *\*DNAse*. *\*Genetic counselling* is essential, as each subsequent child of carrier parents has a one in four chance of being affected (*see also* **MOUTHWASH TEST**; **PREIMPLANTATION GENETIC DIAGNOSIS**). Some patients are benefiting from revolutionary new treatments, including transplantation of heart and lungs and treatment aimed at altering the genetic content of the faulty cells (*see* **GENE THERAPY**).

<https://www.cysticfibrosis.org.uk/>

- Website of the Cystic Fibrosis Trust

**cystic hygroma** a collection of fluid behind the neck of a fetus, occasionally extending laterally to involve the sides of the neck (*see* **HYDROPS FETALIS**). In its mildest form it is evidenced by an increased nuchal translucency (*see* **NUCHAL TRANSLUCENCY SCANNING**). Cystic hygroma may be a diagnostic feature of chromosomal abnormality (e.g. Down's syndrome, Turner's syndrome).

**cystine** *n.* *see* [AMINO ACID](#).

**cystinosis** *n.* an inborn defect in the metabolism of amino acids, leading to abnormal accumulation of the amino acid cystine in the blood, kidneys, and lymphatic system. *See also* [FANCONI SYNDROME](#).

**cystinuria** *n.* an [\\*inborn error of metabolism](#) resulting in excessive excretion of the amino acid cystine in the urine due to a defect of reabsorption by the kidney tubules. It may lead to the formation of cystine stones in the kidney.

**cystitis** *n.* inflammation of the urinary bladder, often caused by infection (most commonly by the bacterium *Escherichia coli*). It is usually accompanied by the desire to pass urine frequently, with a degree of burning. More severe attacks are often associated with the painful passage of blood in the urine, which is accompanied by a cramplike pain in the lower abdomen persisting after the bladder has been emptied. An acute attack is treated by antibiotic administration and a copious fluid intake. *See also* [INTERSTITIAL CYSTITIS](#).

**cystitome** *n.* a fine curved needle with a hooked tip or a small knife with a tiny curved or hooked blade, used to create an opening in the lens capsule in the type of operation for cataract in which the capsule is left behind (extracapsular [\\*cataract extraction](#); *see* [PHACOEMULSIFICATION](#)).

**cystocele** *n.* prolapse of the base of the bladder in women. It is usually due to weakness of the pelvic floor after childbirth and causes bulging of the anterior wall of the vagina on straining. When accompanied by stress incontinence of urine, surgical repair (anterior [\\*colporrhaphy](#)) is indicated.

**cystography** *n.* X-ray examination of the urinary bladder after filling it with a contrast medium. The X-ray images thus obtained are known as **cystograms**. Cystography is most commonly performed to detect reflux of urine from the bladder to the ureters, usually in children (*see* [VESICoureteric reflux](#)). In adults it is often performed to detect bladder injury or perforation. If films are taken during voiding (micturating cystourethrogram) then the urethra can also be observed (*see* [urethrography](#)). The examination can also be performed in conjunction with manometry (*see* [bladder pressure study](#)).

**cystoid macular oedema** swelling of the central area of the retina (macula), usually occurring as a result of trauma, posterior **\*uveitis**, or ocular surgery.

**cystolithiasis** *n.* the presence of stones (calculi) in the urinary bladder. The stones are either formed in the bladder, due to obstruction, urinary stasis, and infection (**primary calculi**), or pass to the bladder after being formed in the kidneys (**secondary calculi**). They cause pain, the passage of bloody urine, and interruption of the urinary stream and should be removed surgically. *See* **CALCULUS**.

**cystometry** *n.* a measurement of the pressure within the bladder to assess filling and voiding phases of urination in a patient with incontinence. Two catheters are placed into the bladder, one for filling the bladder and the other (a **cystometer**) for recording pressure. Modern investigations also include measurement of urine flow, and the resultant bladder pressure/flow study (**urodynamic investigation**) provides useful information regarding bladder function.

**cystopexy (vesicofixation)** *n.* a surgical operation to fix the urinary bladder (or a portion of it) in a different position. It may be performed as part of the repair or correction of a prolapsed bladder.

**cystoplasty** *n.* an operation to enlarge the capacity of and to decrease the pressure within the bladder by incorporating a segment of bowel. In a **clam cystoplasty**, the bladder is cut across transversely from one side of the neck to the other side through the dome (fundus) of the bladder and a length of the ileum, jejunum, or colon is inserted as a patch. In the operation of **ileocaecocystoplasty**, the dome is removed by cutting across the bladder transversely or sagittally above the openings of the ureters; it is replaced by an isolated segment of caecum and terminal ileum. In **ileocystoplasty** the bladder is enlarged by an opened-out portion of small intestine. The bladder may be totally replaced by a reservoir constructed from either small or large intestine (*see* **CYSTECTOMY**).

**cystosarcoma phylloides** a malignant tumour of the connective tissue of the breast: it accounts for approximately 1% of all breast cancers. Such tumours may show a wide variation in cell structure and they often present as a large mass but without distant spread. The best treatment for a localized tumour is simple **\*mastectomy**.

**cystoscopy** *n.* examination of the bladder by means of an instrument (**cystoscope**) inserted via the urethra. The cystoscope consists of either a metal sheath surrounding a telescope and light-conducting bundles or a flexible tube with built-in optical fibres for viewing and illumination. Irrigating fluid is conducted through a channel into the bladder. When using the rigid instrument, additional channels are available for the insertion of guidewires, ureteric catheters, diathermy electrodes, or biopsy forceps for taking specimens of tumours or other growths. When using the flexible cystoscope, only small instruments can be passed through the additional channel, such as biopsy forceps, diathermy electrodes, or laser fibres for the destruction of tumours or stones.

**cystostomy** *n.* the operation of creating an artificial opening between the bladder and the anterior abdominal wall. This provides a temporary or permanent drainage route for urine.

**cystotomy** *n.* surgical incision into the urinary bladder, usually by cutting through the abdominal wall above the pubic symphysis (**suprapubic cystotomy**). This is necessary for such operations as removing stones or tumours from the bladder and for gaining access to the prostate gland in the operation of transvesical **\*prostatectomy**.

**cyt- (cyto-)** *combining form denoting* **1.** cell(s). **2.** cytoplasm.

**cytarabine** *n.* an **\*antimetabolite** that interferes with pyrimidine synthesis and is used to suppress the symptoms of acute myeloblastic leukaemia and lymphomatous meningitis. It can damage the normal bone marrow, leading to various blood cell disorders. Other side-effects are nausea, vomiting, mouth ulcers, and diarrhoea.

**-cyte** *combining form denoting* a cell. Examples: **chondrocyte** (cartilage cell); **osteocyte** (bone cell).

**cytidine** *n.* a compound containing cytosine and the sugar ribose. *See also* **NUCLEOSIDE**.

**cytochemistry** *n.* the study of chemical compounds and their activities in living cells.

**cytochrome** *n.* a compound consisting of a protein linked to *\*haem*. Cytochromes act as electron transfer agents in biological oxidation-reduction reactions, particularly those associated with the mitochondria in cellular respiration. *See* **ELECTRON TRANSPORT CHAIN**.

**cytogenetics** *n.* a science that links the study of inheritance (genetics) with that of cells (cytology); it is concerned mainly with the study of the *\*chromosomes*, especially their origin, structure, and functions.

**cytokeratin** *n.* a member of a family of proteins – *\*keratins* – found in the cytoplasm of epithelial tissues and the cancers arising in them (*\*carcinomas*). Any given carcinoma has its unique pattern of cytokeratins, which can be identified on histochemical analysis of a specimen and can help in the diagnosis of metastatic carcinoma when the primary site of metastasis is unknown.

**cytokine inhibitor (cytokine modulator)** any one of a group of agents that inhibit the activity of cytokines, especially *\*tumour necrosis factor* alpha (TNF- $\alpha$ ). They include *\*infliximab*, *\*etanercept*, and *\*adalimumab*, known as **anti-TNF drugs**, which are used as *\*disease-modifying antirheumatic drugs* and to treat inflammatory bowel disease.

**cytokines** *pl. n.* protein molecules, released by cells when activated by antigen, that are involved in cell-to-cell communications, acting as enhancing mediators for immune responses through interaction with specific cell-surface receptors on leucocytes. Kinds of cytokines include *\*interleukins* (produced by leucocytes), *\*lymphokines* (produced by lymphocytes), *\*interferons*, and *\*tumour necrosis factor*.

**cytokinesis** *n.* division of the cytoplasm of a cell, which occurs at the end of cell division, after division of the nucleus, to form two daughter cells. *Compare* **KARYOKINESIS**.

**cytology** *n.* the study of the structure and function of cells. The examination of cells under a microscope is used in the diagnosis of various diseases. These cells are obtained by scraping an organ, as in **cervical cytology** (*see* **CERVICAL SMEAR**; **LIQUID-BASED CYTOLOGY**), by aspiration (*see* **ASPIRATION CYTOLOGY**), or they are collected from cells already shed (**exfoliative cytology**). *See also* **BIOPSY**. —**cytological** *adj.*

**cytolysis** *n.* the breakdown of cells, particularly by destruction of their outer membranes.

**cytomegalovirus (CMV)** *n.* a member of the herpes group of viruses (*see* **HERPESVIRUS**). It commonly occurs in humans and normally produces symptoms milder than the common cold. However, in individuals whose immune systems are compromised (e.g. by cancer or AIDS) it can cause more severe effects (such as **\*retinitis**), and it has been found to be the cause of congenital impairment in infants born to women who have contracted the virus during pregnancy.

**cytometer** *n.* an instrument for determining the number of cells in a given quantity of fluid, such as blood, cerebrospinal fluid, or urine. *See* **HAEMOCYTOMETER**.

**cytomorphosis** *n.* the changes undergone by a cell in the course of its life cycle.

**cytopenia** *n.* a deficiency of one or more of the various types of blood cells. *See* **EOSINOPENIA**; **ERYTHROPENIA**; **LYMPHOPENIA**; **NEUTROPENIA**; **PANCYTOPENIA**; **THROMBOCYTOPENIA**.

**cytophotometry** *n.* the study of chemical compounds in living cells by means of a **cytophotometer**, an instrument that measures light intensity through stained areas of cytoplasm.

**cytoplasm** *n.* the jelly-like substance that surrounds the nucleus of a cell. *See also* **ECTOPLASM**; **ENDOPLASM**; **PROTOPLASM**. —**cytoplasmic** *adj.*

**cytoplasmic inheritance** the inheritance of characters controlled by genes present in the cell cytoplasm rather than by genes on the chromosomes in the cell nucleus. An example of cytoplasmic inheritance is that controlled by mitochondrial genes (*see* **MITOCHONDRION**).

**cytosine** *n.* one of the nitrogen-containing bases (*see* **PYRIMIDINE**) that occurs in the nucleic acids DNA and RNA.

**cytosome** *n.* the part of a cell that is outside the nucleus.

**cytotoxic drug** any drug that damages or destroys cells: usually refers to those drugs used to treat various types of cancer. There are various classes of cytotoxic drugs, including *\*alkylating agents* (e.g. *\*chlorambucil*, *\*cyclophosphamide*, *\*melphalan*), *\*antimetabolites* (e.g. *\*fluorouracil*, *\*methotrexate*, *\*mercaptopurine*), *\*anthracycline* antibiotics (e.g. *\*doxorubicin*, *\*daunorubicin*, *\*dactinomycin*), *\*vinca alkaloids*, and platinum compounds (e.g. *\*carboplatin*, *\*cisplatin*). Other cytotoxic drugs include *\*taxanes* and *\*topoisomerase inhibitors*, and some *\*monoclonal antibodies* (e.g. *\*bevacizumab*, *\*trastuzumab*) have cytotoxic activity. All these drugs offer successful treatment in some conditions and help reduce symptoms and prolong life in others. Cytotoxic drugs destroy cancer cells by interfering with cell division, but they also affect normal cells, particularly in bone marrow (causing *\*myelosuppression*), hair follicles (causing hair loss), the stomach lining (resulting in severe nausea and vomiting), mouth (causing soreness), and fetal tissue (they should not be taken during the later stages of pregnancy). Dosage must therefore be carefully controlled. *See also* **CHEMOTHERAPY**.

**cytotoxic T cell** a type of T *\*lymphocyte* that destroys cancerous cells, virus-infected cells, and *\*allografts*. Cytotoxic T cells recognize peptide antigens attached to proteins that are encoded by the *\*HLA system*.

**cytotrophoblast** *n. see* **TROPHOBLAST**.

# D

**dabigatran etexilate** a drug used for the prevention of venous thromboembolism following hip or knee replacement surgery and for the prevention of stroke and embolism in patients with atrial fibrillation: it directly inhibits the action of **\*thrombin**. The most common side-effect is haemorrhage.

**dacarbazine** *n.* a drug used in the treatment of melanoma and (in combination with other **\*cytotoxic drugs**) soft tissue sarcomas and Hodgkin's disease. Side-effects include severe nausea and vomiting and **\*myelosuppression**.

**dacrocyte** *n.* a red blood cell (erythrocyte) that is shaped like a teardrop. This occurs in conditions such as **\*myelofibrosis** and infiltration of the bone marrow with tumour cells.

**dacry-** (**dacryo-**) *combining form denoting* **1.** tears. **2.** the lacrimal apparatus.

**dacryoadenitis** *n.* inflammation of the tear-producing (lacrimal) gland (*see* **LACRIMAL APPARATUS**).

**dacryocystitis** *n.* inflammation of the lacrimal sac (in which tears collect), usually occurring when the duct draining the tears into the nose is blocked (*see* **LACRIMAL APPARATUS**).

**dacryocystorhinostomy (DCR)** *n.* an operation to relieve blockage of the nasolacrimal duct (which drains tears into the nose), in which a communication is made between the lacrimal sac and the nose by removing the intervening bone. It is done via a skin incision (**external DCR**) or through the nose (**endonasal DCR**). *See* **DACRYOCYSTITIS**; **LACRIMAL APPARATUS**.

**dactinomycin (actinomycin D)** *n.* a **\*cytotoxic drug** (an antibiotic) used mainly to treat cancers in children. Side-effects include nausea, vomiting, diarrhoea, blood disorders, and bone-marrow damage.

**dactyl-** *combining form denoting the digits (fingers or toes).* Examples: **dactylomegaly** (abnormally large size of); **dactylospasm** (painful contraction of).

**dactylitis** *n.* inflammation of a finger or toe caused by bone infection (as in tuberculous **\*osteomyelitis**) or rheumatic diseases, such as spondyloarthropathy, psoriatic arthritis, or sarcoidosis or seen in infants with sickle-cell disease. The whole digit is swollen and may resemble a sausage (known as 'sausage digit'). The diffuse swelling arises from the flexor tendon, its sheath, and adjacent soft tissue.

**dactylology** *n.* the representation of speech by finger movements: sign language.

**DAFNE (dose adjustment for normal eating)** a structured five-day education programme for patients with insulin-dependent **\*diabetes**. It teaches participants to adjust their insulin dosage according to their carbohydrate intake. Outcomes show improved glycaemic control and quality of life.

**dalteparin sodium** *see* **LOW-MOLECULAR-WEIGHT HEPARIN**.

**Daltonism (protanopia)** *n.* red-blindness: a defect in colour vision in which a person cannot distinguish between reds and greens. The term has been used to refer to **\*colour blindness** in general. [J. Dalton (1766–1844), British chemist]

**damp** *n.* (in mining) any gas encountered underground other than air. *See* **BLACKDAMP**; **FIRE DAMP**.

**danazol** *n.* a synthetic **\*progestogen** that inhibits the secretion by the pituitary gland of gonadotrophins. It is used to treat endometriosis, severe pain associated with cystic breast tumours, and severe urticaria. Possible side-effects include nausea, rashes, swelling of the feet and ankles, weight gain, oiliness of the skin, and, in women, menstrual disturbances, excessive growth

of facial and body hair, and irreversible voice changes. Because of the severity of these effects, danazol is now rarely used in gynaecology.

**Dance's sign** *see* SIGN OF DANCE.

**D and C** *see* DILATATION AND CURETTAGE.

**dandruff** *n.* visible scaling from the surface of the scalp. It is extremely common, occurring in about 50% of the population, and is associated with the presence of the yeast *Malassezia furfur*. It is the precursor of seborrhoeic **\*eczema** of the scalp, in which there is a degree of inflammation in addition to the greasy scaling. Dandruff can be controlled by shampoos containing tar, selenium sulphide, pyridione zinc, or imidazole antifungals. Medical name: **pityriasis capitis**.

**Dandy–Walker syndrome** a form of **\*cerebral palsy** in which the **\*cerebellum** is usually the part of the brain affected. It leads to unsteadiness of balance and an abnormal gait and may be associated with **\*hydrocephalus**. [W. E. Dandy (1886–1946) and A. E. Walker (1907–95), US surgeons]

**dangerous drugs** *see* MISUSE OF DRUGS ACT 1971.

**dantrolene** *n.* a **\*muscle relaxant** drug used to relieve spasticity in such conditions as cerebral palsy, multiple sclerosis, and spinal cord injury. Possible side-effects include weakness, dizziness, drowsiness, and diarrhoea; liver damage sometimes occurs. It is also used to treat malignant hyperthermia, a serious complication of anaesthesia.

**dantron (danthron)** *n.* a stimulant **\*laxative** administered by mouth for treating constipation in terminally ill patients; it sometimes colours the urine pink or red. It is usually combined with a faecal softener (e.g. in **co-danthramer, co-danthrusate**).

**dapaglifozin** *n.* *see* SGLT-2 INHIBITORS.

**dapsone** *n.* a drug (*see* SULPHONE) used to treat **\*leprosy** and dermatitis herpetiformis and to prevent *Pneumocystis pneumonia*. The most common side-effects are allergic skin reactions.

**DAPT** *see* DUAL ANTIPLATELET THERAPY.

**dark adaptation** the changes that take place in the retina and pupil of the eye enabling vision in very dim light. Dark adaptation involves activation of the **\*rods** – the cells of the retina that function best in dim light – and the reflex enlargement of the pupil (see **PUPILLARY REFLEX**). Compare **LIGHT ADAPTATION**.

**dasatinib** *n.* see **TYROSINE KINASE INHIBITOR**.

**data protection** legal safeguards relating to the use and storage of personal information about a living person. Under the Data Protection Act 2018, which implements the EU's General Data Protection Regulation (GDPR) and supersedes the Data Protection Act 1998, individuals have a basic right to control information stored about them. Information concerning health, considered 'sensitive personal data' under the legislation, must be used only for the purpose (health care of the individual) for which it was gathered, must be kept secret, and cannot be used or passed on to others without the knowledge of the subject. However, anonymized health data from individual patients' electronic records may be used for research purposes or to improve medical treatment and health-service delivery.

**daunorubicin** *n.* an **\*anthracycline** antibiotic that interferes with DNA synthesis and is used in the treatment of acute leukaemias and AIDS-related Kaposi's sarcoma. Possible side-effects include loss of hair and damage to bone marrow and heart muscle.

**da Vinci robot** see **PROSTATECTOMY**.

**dawn phenomenon (Somogyi effect)** the phenomenon of high fasting blood-sugar levels in the morning due to an unrecognized hypoglycaemic episode during the night in a person with diabetes. The low blood sugar has resulted in an outpouring of regulatory hormones, such as adrenaline and glucagon, which have raised the blood sugar to supranormal levels by the time of waking. It is important to recognize the cause, since increasing the evening insulin dose, thinking this will bring the morning sugars down, could actually cause a more severe nocturnal hypoglycaemic attack, which the body may not be able to counteract: coma might ensue. The condition can be tested for by measuring blood sugars at the time of the assumed low level.

**day blindness (hemeralopia)** comparatively good vision in poor light but poor vision in good illumination. The condition is usually congenital and associated with poor *\*visual acuity* and defective colour vision. Acquired cases occur when the *\*cones* (light-sensitive cells) are selectively destroyed by disease. *Compare* NIGHT BLINDNESS.

**day-case surgery** surgical procedures that can be performed in a single day, without the need to admit the patient for an overnight stay in hospital. Modern techniques of surgery and anaesthesia now enable many surgical cases of minor and intermediate degrees of severity to be treated in this way: examples include many breast lesions, dilatation and curettage, and operations for hernia and varicose veins. Special units are established in many hospitals.

**day hospital** a hospital in which patients spend a substantial part of the day under clinical supervision but do not stay overnight. Day hospitals are mainly used for the assessment, treatment, and rehabilitation of elderly patients and those with mental disorders. Patients may attend on one or more days during the week.

**DBS** *see* DEEP BRAIN STIMULATION.

**D cells** *see* ISLETS OF LANGERHANS.

**DCIS** *see* DUCTAL CARCINOMA IN SITU.

**DCR** *see* DACRYOCYSTORHINOSTOMY.

**D-dimer** *n.* a protein measured in a blood test to diagnose thrombosis. Although a negative result practically rules out thrombosis, a positive result can indicate thrombosis but also has other potential causes. Its main use, therefore, is to exclude thromboembolic disease where the probability is low. This test is now widely used in protocols for the diagnosis of *\*pulmonary embolism*.

**DDT (chlorophenothane, dicophane)** *n.* a powerful insecticide that was formerly widely used against lice, fleas, flies, bed bugs, cockroaches, and other disease-carrying and destructive insects. It is a relatively stable compound that is stored in animal fats, and the quantities now present in the environment – in the form of stores accumulated in animal tissues – have led

to its use being restricted. Acute poisoning, from swallowing more than 20 g, produces nervous irritability, muscle twitching, convulsions, and coma, but only a few fatalities have been reported.

**de-** *prefix denoting* **1.** removal or loss. Examples: **demineralization** (of minerals from bones or teeth); **devascularization** (of blood supply). **2.** reversal.

**deafness** *n.* partial or total loss of hearing in one or both ears, now becoming more commonly called **hearing loss**. **Conductive deafness** is due to a defect in the conduction of sound from the external ear to the inner ear. This may be due to perforations of the eardrum, fluid or infection in the middle ear (*see* **GLUE EAR**; **OTITIS**), or disorders of the small bones in the middle ear (*\*ossicles*). **Sensorineural** (or **perceptive**) **deafness** may be due to a lesion of the *\*cochlea* in the inner ear, the cochlear nerve, or the auditory centres in the brain. It may be present from birth (for example if the mother was affected with German measles during pregnancy). In adults it may be brought on by injury, disease (e.g. *\*Ménière's disease*), or prolonged exposure to loud noise; progressive sensorineural deafness (**presbycusis**) is common with advancing age. Some forms of deafness have both conductive and sensorineural components, in which case it is called a **mixed hearing loss**.

The type of deafness can be diagnosed by various hearing tests (*see* **RINNE'S TEST**; **WEBER'S TEST**; **AUDIOGRAM**), and the treatment depends on the cause. *See also* **COCHLEAR IMPLANT**; **HEARING AID**; **HEARING THERAPY**.

<https://bda.org.uk/>

- Website of the British Deaf Association: includes information on British Sign Language

<http://www.actiononhearingloss.org.uk/>

- Website of Action on Hearing Loss (formerly the Royal National Institute for Deaf People)

**deamination** *n.* a process, occurring in the liver, that occurs during the metabolism of amino acids. The amino group ( $-\text{NH}_2$ ) is removed from an amino acid and converted to ammonia, which is ultimately converted to **\*urea** and excreted.

**death** *n.* absence of vital functions. Death is diagnosed by permanent cessation of the heartbeat. **Brain death** is defined as permanent functional death of the centres in the brainstem that control breathing, heart rate, and other vital reflexes (including pupillary responses). Many decisions in medicine depend on death being clearly defined and objectively observed. Particular problems arise when a potential organ donor is being kept artificially alive. Legally, two independent medical opinions are required before brain death is agreed and organs can be removed for transplantation. In medical ethics, death is of crucial interest because it elucidates debates about **\*personhood** and prompts consideration of the duties owed to the living and the deceased. Religious perspectives on death may inform the ways in which people perceive the withdrawal of medical treatment and organ donation. See **DYING**.

**death certificate** a legal document, signed by a doctor, stating (in Part 1) the immediate cause of a person's death followed by diseases underlying the condition. For example, if the immediate cause of death was a myocardial infarction, the underlying disease might have been ischaemic heart disease or hypertension. Other diseases, which were not directly linked with the immediate cause of death but may have contributed to the patient's overall condition, are mentioned in Part 2 of the certificate. The document usually states the decedent's gender and date and place of death; other details, such as occupation, may also be included. The death certificate forms a vital record in most countries throughout the world; without a death certificate, there can be no funeral. For England and Wales, this information is held at the General Register Office, which is now in Southport. In Scotland death certificates are kept at the National Records of Scotland, and in Northern Ireland at the General Register Office for Northern Ireland. Following the case of the serial killer Dr Harold Shipman and the subsequent public enquiry, legislation has introduced greater checks on, and scrutiny of, death certification by doctors.

**debridement** *n.* **1.** the process of cleaning an open wound by the removal of foreign material and damaged or dead tissue, so that healing may occur without hindrance. **2.** (in dentistry) the cleaning of the root canal in *\*root canal treatment*.

**dec- (deca-)** *prefix denoting ten.*

**decalcification** *n.* loss or removal of calcium salts from a bone or tooth.

**decapitation** *n.* removal of the head, usually the head of a dead fetus to enable delivery to take place. This procedure is very rare nowadays, being undertaken only in dire circumstances when the fetal head is too large to pass through the birth canal, the mother's life is endangered, and Caesarean section impossible.

**decapsulation** *n.* *see* **DECORTICATION**.

**decay** *n.* (in bacteriology) the decomposition of organic matter due to microbial action.

**deception** *n.* the act of deliberately misleading, misrepresenting, or withholding information. Respect for patient *\*autonomy* and the importance of trust in therapeutic relationships require that doctors should always strive to be honest with patients. The use of deception in research (*see* **INTERVENTION STUDY**) is ethically highly controversial. *See also* **THERAPEUTIC PRIVILEGE**; **TRUTH-TELLING**.

**decerebrate** *adj.* denoting a neurological state in which the functions of the higher centres of the brain are eliminated. This is brought about in experimental animals by cutting across the brain below the cerebrum, but certain injuries to the brain in humans may cause the same severe neurological signs as occur in a decerebrate animal.

**deci-** *prefix denoting a tenth.*

**decibel (dB)** *n.* one tenth of a bel: a unit for comparing levels of power (especially sound) on a logarithmic scale. A power source of intensity  $P$  has a power level of  $10 \log_{10} P/P_0$  decibels, where  $P_0$  is the intensity of a reference source. The decibel is much more widely used than the bel. In

humans, the threshold of hearing is 0 dB; a whisper is approximately 30 dB, normal speech 60 dB, a shout 90 dB, and a jet aircraft 120 dB.

**decidua** *n.* the modified mucous membrane that lines the wall of the uterus during pregnancy and is shed with the afterbirth at parturition (*see* **ENDOMETRIUM**). There are three regions: the **decidua capsularis**, a thin layer that covers the embryo; the **decidua basalis**, where the embryo is attached; and the **decidua parietalis**, which is not in contact with the embryo. —**decidual** *adj.*

**deciduous teeth** *see* **PRIMARY TEETH**.

**de Clérambault syndrome** *see* **EROTOMANIA**. [G. G. de Clérambault (1872–1934), French physician]

**declive** *n.* an area of the upper surface of the **\*cerebellum**, posterior to the culmen and anterior to the folium of the middle lobe.

**declotting** *n.* the removal of a blood clot from a thrombosed arteriovenous **\*fistula** (which is created to perform dialysis). This can be done either by surgically opening the fistula and removing the clot or by using interventional radiological techniques (*see* **FISTULOPLASTY**).

**decomposition** *n.* the temperature-dependent gradual disintegration of dead organic matter, usually foodstuffs or tissues, by the chemical action of bacteria and/or fungi.

**decompression** *n.* **1.** the reduction of pressure on an organ or part of the body by surgical intervention. Surgical decompression can be effected at many sites: the pressure of tissues on a nerve may be relieved by incision; raised pressure in the fluid of the brain can be lowered by cutting into the **\*dura mater**; and cardiac compression – the abnormal presence of blood or fluid round the heart – can be cured by cutting the sac (pericardium) enclosing the heart. **2.** the gradual reduction of atmospheric pressure for deep-sea divers, who work at artificially high pressures. *See* **COMPRESSED AIR ILLNESS**.

**decompression sickness** *see* **COMPRESSED AIR ILLNESS**.

**decongestant** *n.* an agent that reduces or relieves nasal congestion. Nasal decongestants are **\*sympathomimetic** or **\*antimuscarinic** drugs applied

locally, in the form of nasal sprays or drops.

**decongestive therapy** an approach that combines many of the different treatments (such as compression and physiotherapy) used to minimize the pain and swelling associated with **\*lymphoedema** following breast surgery and radiotherapy. There are two phases: reduction (which lasts up to 12 weeks) and maintenance (which continues for life).

**decontamination** *n.* **1.** a combination of processes used to remove adherent proteins, microorganisms, and infectious agents or other contaminants from surgical instruments and the environment so there is no risk or spread of infection or disease. Instruments are sterilized in an autoclave to finish the decontamination process. **2.** the reduction or removal of chemical agents from a site following a terrorist attack or industrial accident; this includes decontaminating people who have come into contact with such agents.

**decortication** *n.* **1.** the removal of the outside layer (cortex) from an organ or structure, such as the kidney. **2.** an operation for removing the blood clot and scar tissue that forms after bleeding into the chest cavity (haemothorax). **3. (decapsulation)** the surgical removal of a **\*capsule** from an organ; for example, the stripping of the membrane that envelops the kidney or of the inflammatory capsule that encloses a chronic abscess, as in the treatment of **\*empyema**.

**decubitus** **1.** *n.* the recumbent position. **2.** *adj.* describing a radiograph taken with the patient lying on his or her side and the X-ray beam travelling horizontally. Such films reveal **\*free gas** in the peritoneal cavity following perforation of a hollow organ and **\*fluid levels** in the bowel when it is obstructed. They are commonly used in barium enema examinations. *Compare* **ANTEROPOSTERIOR**; **POSTEROANTERIOR**.

**decubitus ulcer** *see* **PRESSURE SORE**.

**decussation** *n.* a point at which two or more structures of the body cross to the opposite side. The term is used particularly for the point at which nerve fibres cross over in the central nervous system.

**deep brain stimulation (DBS)** a surgical treatment involving the implantation of a medical device that sends electrical impulses to specific parts of the brain. DBS in selected brain regions can provide benefits for

treatment-resistant movement disorders, such as Parkinson's disease, tremor, and **\*dystonia**.

**deep transverse arrest** mechanical obstruction of labour in which the fetal head is unable to rotate from occipitotransverse to occipitoanterior position (see **OCCIPUT**).

**deep vein thrombosis (DVT)** see **PHLEBOTHROMBOSIS**.

**deer fly** see **CHRYSOPS**.

**defecation** *n.* a bowel movement in which faeces are evacuated through the rectum and anus. The amount and composition of the food eaten determine to a large degree the bulk of the faeces, and the transit time through the intestinal tract determines the water content. See **CONSTIPATION**; **DIARRHOEA**.

**defence mechanism** the means whereby an undesirable impulse or emotion can be avoided or controlled. Defence mechanisms are regarded as normal forms of self-protection; however, used excessively, they can become pathological. Many defence mechanisms have been described, including **\*repression**, **\*projection**, **\*reaction formation**, **\*sublimation**, and **\*splitting**.

**defensive medicine** health care that becomes distorted by real or exaggerated fear of legal action so that medical decisions are taken with a view to protecting the professional against legal liability. See also **NEGLIGENCE**.

**deferent** *adj.* **1.** carrying away from or down from. **2.** relating to the vas deferens.

**defervescence** *n.* the disappearance of a fever, a process that may occur rapidly or take several days, depending upon the cause and treatment given.

**defibrillation** *n.* administration of a controlled electric shock to restore normal heart rhythm in cases of cardiac arrest due to ventricular **\*fibrillation**. The apparatus used is a **\*defibrillator**.

**defibrillation gel pads** see **COUPLING AGENTS**.

**defibrillator** *n.* the apparatus used for **\*defibrillation**, which may be internal (see **IMPLANTABLE CARDIOVERTOR DEFIBRILLATOR**) or external.

External defibrillators may be fully automated (see [AUTOMATED EXTERNAL DEFIBRILLATOR](#)), semiautomated, or manual and usually deliver the electric current via two defibrillation paddles. They are now all manufactured to deliver a biphasic current waveform (until recently they were all monophasic). The efficacy of the first shock during [\\*cardiac arrest](#) is higher with biphasic systems, which also use less battery power per shock.

**defibrination** *n.* the removal of [\\*fibrin](#), one of the plasma proteins that causes coagulation, from a sample of blood. It is normally done by whisking the blood with a bundle of fine wires, to which the strands of fibrin that form in the blood adhere.

**deficiency** *n.* (in genetics) see [DELETION](#).

**deficiency disease** any disease caused by the lack of an essential nutrient in the diet. Such nutrients include [\\*vitamins](#), minerals, [\\*essential amino acids](#), and [\\*essential fatty acids](#).

**degarelix** *n.* a [\\*gonadotrophin-releasing hormone](#) antagonist used in the treatment of advanced prostate cancer that does not cause an initial increase in testosterone levels. Side-effects include hot flushes and pain at the injection site.

**degeneration** *n.* the deterioration and loss of specialized function of the cells of a tissue or organ. The changes may be caused by a defective blood supply or by disease. Degeneration may involve the deposition of calcium salts, fat (see [FATTY DEGENERATION](#)), or fibrous tissue in the affected organ or tissue. See also [INFILTRATION](#).

**deglutition** *n.* see [SWALLOWING](#).

**dehiscence** *n.* **1.** a splitting open, as of a surgical wound. **2.** (in dentistry) loss of alveolar bone from the facial aspect of a tooth that leaves a root-exposing defect, typically oval in shape, extending from the [\\*cemento-enamel](#) junction towards the apex.

**dehydration** *n.* **1.** loss or deficiency of water in body tissues. The condition may result from inadequate water intake and/or from excessive removal of water from the body; for example, by sweating, vomiting, or diarrhoea. Symptoms include great thirst, nausea, and exhaustion. The condition is

treated by drinking plenty of water; severe cases require *\*oral rehydration therapy* or intravenous administration of water and salts (which have been lost with the water). **2.** the removal of water from tissue during its preparation for microscopical study, by placing it successively in stronger solutions of ethyl alcohol. Dehydration follows *\*fixation* and precedes *\*clearing*.

**dehydroepiandrosterone (DHEA)** *n.* a weak androgen produced and secreted by the adrenal glands after the stage of adrenal maturation known as *\*adrenarche*. It is produced from 17-hydroxypregnenolone and itself is largely converted to **dehydroepiandrosterone sulphate** and **androstenedione**. All three of these molecules can cause a degree of mild *\*androgenization* but can also be converted in the circulation to the more potent androgens *\*testosterone* and *\*dihydrotestosterone*.

**dehydrogenase** *n. see* **OXIDOREDUCTASE**.

**déjà vu** a vivid psychic experience in which immediately contemporary events seem to be a repetition of previous happenings. It is a symptom of some forms of *\*epilepsy*. *See also* **JAMAIS VU**.

**delayed suture (delayed primary closure)** a technique used in the closure of contaminated wounds and wounds associated with tissue necrosis, such as those produced by missile injuries. The wound is partially closed after it has been cleaned sufficiently to allow adequate healing.

**deletion (deficiency)** *n.* (in genetics) a type of mutation involving the loss of DNA. The deletion may be small, affecting only a portion of a single gene, or large, resulting in loss of a part of a chromosome and affecting many genes.

**Delhi boil** *see* **ORIENTAL SORE**.

**deliberate self-harm** any attempt at self-injury or self-poisoning, as often occurs in the context of acute stress, personality disorder, depression, and alcoholism. It may or may not involve suicidal intent. Treatment begins with a psychosocial assessment, on the basis of which the patient may be offered various forms of *\*psychotherapy* and occasionally *\*antipsychotic* medication, *\*lithium*, or *\*SSRIs*. If the attempt is serious, immediate treatment may be necessary in a medical ward or (more rarely), if suicidal intent persists, in a psychiatric ward. Patients who do not have a mental disorder should be

assessed using the criteria set out in the Mental Capacity Act 2005 and, if found to have *\*capacity*, are entitled to consent to or refuse treatment like any other capacitous adult. *See also* [SUICIDE](#).

**delirium** *n.* an acute disorder of the mental processes characterized by fluctuating levels of consciousness, responsiveness, and cognitive ability. It may be manifested by delusions, disorientation, hallucinations, or extreme excitement. There are many possible causes, ranging from head injury to hip or other fracture, infection, constipation, dehydration, pain, or drug side-effects. Treatment is by removal of the underlying cause and supportive medical measures.

**delirium tremens** an acute confusional state often seen as a withdrawal syndrome in chronic alcoholics (*see* [ALCOHOLISM](#)) and caused by sudden cessation of drinking alcohol. Features include anxiety, tremor, sweating, and vivid and terrifying visual and sensory hallucinations, often of animals and insects. Without medical treatment severe cases may end fatally.

**delivery** *n.* *see* [LABOUR](#).

**dellen** *pl. n.* localized areas of corneal thinning, usually at the limbus (the junction of the cornea with the sclera), due to local dehydration. They may occur after surgery to correct a squint, due to elevated conjunctiva at the limbus causing poor wetting of the adjacent cornea.

**deltoid** *n.* a thick triangular muscle that covers the shoulder joint (*see* illustration). It is responsible for raising the arm away from the side of the body.

**The deltoid muscle.**

**delusion** *n.* a belief that is held with unshakable conviction, cannot be altered by rational argument, and is outside the person's normal cultural or subcultural belief system. The belief is usually wrong, but can occasionally be true: the abnormal pathology lies in the irrational way in which the person comes to the belief. In mental illness it may be a false belief that the individual is persecuted by others (**paranoid delusion**; see [PARANOIA](#)), is very powerful (**grandiose delusion**), is guilty of something they have not actually done, is poor, or is a victim of physical disease. Delusions may be a symptom of [\\*schizophrenia](#), acute intoxication, [\\*mania](#), [\\*delirium](#), or an organic [\\*psychosis](#). The intensity of the delusional belief may vary over time.

**delusional infestation** a [\\*monodelusional disorder](#) in which patients believe they or their environment are infested by living or non-living pathogens. These can range from rats in the patient's house to microspores in the air. Most commonly, patients claim they are infested with insects, worms, parasites, mites, or inanimate threads or fibres, often underneath their skin. Many present the alleged parasite as a specimen for examination. If compliance can be established, most patients respond well to [\\*antipsychotic](#) medication. The term delusional infestation was first introduced by Roland W. Freudenmann and Peter Lepping in 2009, and has gradually superseded the terms **delusional parasitosis** and **Ekbom's syndrome**.

**delusional intensity** the intensity with which a delusional belief is held. This can vary over time and sometimes shifts quite rapidly. Some factors, such as treatment, may temporarily or permanently reduce the intensity of a delusion, while others may work to reinforce it.

**delusional jealousy** a **\*delusional** belief that one's partner is unfaithful when there is no reasonable evidence for this. It often occurs in the context of **\*alcoholism**.

**delusional parasitosis** *see* **DELUSIONAL INFESTATION**.

**delusional perception** a **\*Schneiderian first-rank symptom** in which a person believes that a normal percept (product of perception) has a special meaning for him or her. For example, a cloud in the sky may be misinterpreted as meaning that someone has sent that person a message to save the world. While the symptom is particularly indicative of **\*schizophrenia**, it also occurs in other psychoses, including **\*mania** (in which it often has grandiose undertones).

**delusion by proxy** a delusion in which the patient believes that another person or an animal (usually the patient's pet) has certain physical symptoms, even though these cannot be objectively verified. The patient with the delusional belief is called the **inducer**; the person or pet that is allegedly affected is the **proxy**. Some **\*monodelusional disorders**, such as **\*delusional infestation**, have a prevalence of delusion by proxy of up to 5%. Treatment is usually with **\*antipsychotics**. In some situations it may be necessary to remove the proxy to provide safety from the behaviour associated with the delusion. *See also* **DOUBLE DELUSION**; **FOLIE À DEUX**.

**delusion of reference** a **\*delusion** in which the patient believes that unsuspecting occurrences refer to him or her in person. Patients may, for example, believe that certain news bulletins have a direct reference to them, that music played on the radio is played for them, or that car licence plates have a meaning relevant to them. **Ideas of reference** differ from delusions of reference in that insight is retained.

**demeclocycline** *n.* a **\*tetracycline** antibiotic that is used to treat infections caused by *Chlamydia*, rickettsiae, and mycoplasmas. It is also used to treat **\*syndrome** of inappropriate secretion of antidiuretic hormone. Common side-

effects are nausea, diarrhoea, and symptoms resulting from the growth of organisms not sensitive to the drug.

**dementia** *n.* a chronic and progressive deterioration of behaviour and higher intellectual function due to organic brain disease. It is marked by memory disorders, changes in personality, deterioration in personal care, impaired reasoning ability, and disorientation. Dementia is usually a condition of old age, but it can occur in young or middle-aged people. The most common causes are *\*Alzheimer's disease*, **vascular dementia** resulting from the destruction of brain tissue by a series of small strokes, and dementia due to diffuse *\*cortical Lewy body disease* (see also **FRONTOTEMPORAL DEMENTIA**). Also common is **mixed dementia**, which combines aspects of vascular damage and Alzheimer's disease. It is important to distinguish these organic conditions from psychological disorders that can cause similar symptoms such as *\*depression* (see **PSEUDODEMENTIA**).

**demi-** *prefix denoting half.*

**Demodex** *n.* a genus of harmless parasitic mites, the follicle mites, found in the hair follicles and associated sebaceous glands of the face. They resemble tiny worms, about 0.4 mm in length, and their presence may give rise to dermatitis.

**demography** *n.* the study of populations on a national, regional, or local basis in terms of age, sex, and other *\*variables*, including patterns of migration and survival. It is used in *\*public health medicine* to help identify health needs and *\*risk factors*. See also **BIOSTATISTICS**.

**demulcent** *n.* a soothing agent that protects the mucous membranes and relieves irritation. Demulcents form a protective film and are used in mouth washes, gargles, etc., to soothe irritation or inflammation in the mouth.

**demyelination** *n.* damage to the *\*myelin* sheaths surrounding the nerve fibres in the central or peripheral nervous system. This in turn affects the function of the nerve fibres, which the myelin normally supports. Demyelination may be a primary disorder, as in *\*multiple sclerosis*. There may be associated nerve-fibre damage.

**denaturation** *n.* the changes in the physical and physiological properties of a protein that are brought about by heat, X-rays, or chemicals. These changes include loss of activity (in the case of enzymes) and loss (or alteration) of antigenicity (in the case of *\*antigens*).

**dendrite** *n.* one of the shorter branching processes of the cell body of a *\*neuron*, which makes contact with other neurons at synapses and carries nerve impulses from them into the cell body.

**dendritic cell** a type of haemopoietic cell with specialized antigen-presenting functions. The head and neck are common sites for dendritic cell pathology. See **ANTIGEN-PRESENTING CELL**.

**dendritic ulcer** a branching ulcer of the surface of the cornea caused by *\*herpes* simplex virus. A similar appearance may be produced by a healing corneal abrasion. Dendritic ulcers tend to recur because the virus lies dormant in the corneal sensory nerves; years may elapse between recurrences.

**denervation** *n.* interruption of the nerve supply to the muscles and skin. The muscle is paralysed and its normal tone (elasticity) is lost. The muscle fibres atrophy (shrink) and are replaced by fat. A denervated area of skin loses all forms of sensation and its subsequent ability to heal and renew its tissues may be impaired.

**dengue (breakbone fever)** *n.* a disease caused by arboviruses and transmitted to humans principally by the mosquito *\*Aedes aegypti*. Symptoms, which last for a few days, include severe pains in the joints and muscles, headache, sore throat, fever, running of the eyes, and an irritating rash. These symptoms recur in a usually milder form after an interval of two or three days. Death rarely occurs, but the patient is left debilitated and requires considerable convalescence. A more severe form, **dengue haemorrhagic fever**, characterized by a breakdown of the blood-clotting mechanism with internal bleeding, can affect children. Dengue occurs throughout the tropics and subtropics. Patients are given aspirin and codeine to relieve the pain and calamine lotion is helpful in easing the irritating rash.

**denominator** *n.* the part of the fetus that is used to describe positions for *\*presentation*. For vertex (back of the head) presentation, it is the *\*occiput*;

for breech presentation, the sacrum; for face presentation, the mentum (chin).

**denosumab** *n.* a **\*monoclonal antibody** most commonly used in the treatment of postmenopausal osteoporosis to prevent fractures but also indicated at a higher dose to prevent bone damage in patients with bone metastases. Side-effects include a risk of low calcium, infections, joint pains, fatigue, and headache, all more common with the higher doses.

**dens** *n.* a tooth or tooth-shaped structure.

**dense**      **deposit**      **disease**      *see*      **MESANGIOCAPILLARY GLOMERULONEPHRITIS.**

**dens invaginatus** literally, an infolded tooth: a specific type of tooth malformation that mainly affects upper lateral incisors to varying degrees. Also known as a **dens in dente** ('tooth within a tooth'), it involves an infolding of enamel into dentine.

**dent-** (**denti-**, **dento-**) *combining form denoting the teeth.* Example: **dentoalveolar** (relating to the teeth and associated jaw).

**dental care professional** any of several professionals supporting a dentist, formerly referred to as **dental auxiliaries** and **professionals complementary to dentistry**. A **dental hygienist** performs scaling and instruction in oral hygiene. A **dental nurse** helps the dentist at the chairside by preparing materials, passing instruments, and aspirating fluids from the patient's mouth. A **dental technician** constructs dentures, crowns, and orthodontic appliances in the laboratory for the dentist. A **clinical dental technician** provides dentures directly to patients. A **dental therapist** performs non-complex treatment under the prescription of a dentist. In the UK dental care professionals are required to be statutorily registered with the General Dental Council (GDC).

**dental caries** the decay and crumbling of the substance of a tooth. Dental caries is caused by the metabolism of the bacteria in **\*plaque** attached to the surface of the tooth. Acid formed by bacterial breakdown of sugar in the diet causes demineralization of the enamel of the tooth. If no preventive measure or treatment is carried out it spreads into the dentine and progressively destroys the tooth. It is the most common cause of toothache, and once

infection has spread to the pulp it may extend through the root canal into the periapical tissues to cause an **\*apical abscess**.

Frequent intake of sugar as well as poor oral hygiene is a major cause. The disease is more common in young people and has a predilection for specific sites. Dental caries can be most effectively prevented by restricting the frequency of sugar intake and avoiding sweet food and drinks at bedtime. The resistance of enamel to dental caries can be increased by the application of **\*fluoride** salts to the tooth surface from toothpastes or mouth rinses. **\*Fluoridation** of water also makes teeth resistant to caries during the period of tooth development. Once caries has spread into the dentine, treatment usually consists of removing the decayed part of the tooth using a **\*drill** and replacing it with a **\*filling**.

**dental chair** a reclinable chair on which a patient lies for dental treatment. Electric switches change the position of the patient, and the chair is frequently attached to the **\*dental unit**.

**dental floss** a fine thread, usually of nylon, used to clean the surfaces between teeth. A thicker version is known as **dental tape**. It may be waxed to help the user slide it past the tooth contacts.

**dental handpiece** a piece of dental equipment (high-speed or low-speed) for holding a dental **\*bur** or **\*file**. It is made of corrosion-resistant materials to allow sterilization. *See* **DRILL**.

**dental implant** *see* **IMPLANT**.

**dental nerve** either of two nerves that supply the teeth; they are branches of the trigeminal nerve. The **inferior dental nerve** supplies the lower teeth and for most of its length exists as a single large bundle; thus anaesthesia of it has a widespread effect (*see* **INFERIOR DENTAL BLOCK**). The **superior dental nerve**, which supplies the upper teeth, breaks into separate branches at some distance from the teeth and it is possible to anaesthetize these individually with less widespread effect for the patient.

**dental nurse** *see* **DENTAL CARE PROFESSIONAL**.

**dental pantomogram (DPT)** a special form of tomogram (*see* **TOMOGRAPHY**) that provides a picture of all the teeth of both jaws on one

film. Newer equipment can produce three-dimensional images of part of the jaw.

**dental unit** *n.* a major fixed piece of dental equipment to which are attached the dental drills, aspirator, compressed air syringe, and ultrasonic scaler. It is frequently integral with the **\*dental chair**.

**dentate** *adj.* **1.** having teeth. **2.** serrated; having toothlike projections.

**dentifrice** *n.* any paste, powder, gel, or liquid used for cleaning the teeth. *See* **TOOTHPASTE**.

**dentine** *n.* the hard tissue that forms the main structure of a tooth. It is the second hardest tissue in the body after **\*enamel** and is about 70% mineral (hydroxyapatite crystals), the remainder being organic matter and water. The dentine of the crown is covered by enamel and that of the root by cementum. The dentine is permeated by fine tubules, which near the centre of the tooth contain cellular processes from the pulp. Exposed dentine is sensitive to touch, heat, and cold.

**dentinogenesis** *n.* the formation of **\*dentine** by **\*odontoblasts**. Although dentinogenesis continues throughout life, very little dentine is formed later than a few years after tooth eruption unless it is stimulated by caries, abrasion, or trauma. **Dentinogenesis imperfecta** is a hereditary condition in which dentine formation is disturbed; this may result in loss of overlying enamel and excessive wear of the dentine.

**dentist** *n.* a person who is qualified to examine, diagnose, and treat diseases and other conditions that affect the teeth and gums. In the UK, dentists must be registered with the General Dental Council (GDC).

**dentistry** *n.* the study, management, diagnosis, and treatment of diseases and conditions affecting the mouth, jaws, teeth, and their supporting tissues. Subdisciplines include dental public health, **\*endodontics**, oral medicine, oral surgery, **\*orthodontics**, **\*paediatric dentistry**, **\*periodontology**, preventive dentistry, **\*prosthodontics**, and restorative dentistry.

**dentition** *n.* the arrangement of teeth in the mouth. The **primary dentition** comprises the teeth of young children. It consists of 20 teeth, made up of incisors, canines, and molars only. The lower incisor erupts first at about 6

months of age, and all the primary teeth have usually erupted by the age of 2½ years. The lower incisors are shed first at about 6 years of age, and from this time until about 13 years old both primary and permanent teeth are present; i.e. there is a **mixed dentition**. The **permanent dentition** consists of up to 32 teeth, made up of incisors, canines, premolars, and molars. The first tooth to erupt is the first molar (at the age of 6 years) and most permanent teeth have appeared by the age of 14 years, although the third molars may not erupt until the age of 18–21 years. See illustrations.

**Primary dentition.**

**Permanent dentition.**

**Dent's disease** a rare X-linked (see [SEX-LINKED](#)) recessive inherited condition usually presenting in childhood or early adult life with polyuria, microscopic haematuria, renal stone disease, or rickets. The majority of patients have a mutation of the gene encoding chloride channel 5 (*CLCN5*); others have a defect of the *OCRL1* gene, normally associated with **Lowe's syndrome**, but do not present with the cataracts, learning disability, and tubular acidosis associated with this condition. In still others the genetic

defect has yet to be defined but is not associated with either *CLCN5* or *OCRL1*. Patients with Dent's disease have evidence of proximal tubular dysfunction. [C. E. Dent (1911–76), British physician]

**denture** *n.* a removable replacement for one or more teeth carried on some type of plate or frame. A **complete denture** replaces all the teeth in one jaw. It is usually made entirely of acrylic resin. A **partial denture** replaces some teeth because others still remain. It is designed to restore function with the least potential damage to the remaining teeth. The framework of the denture base is often made of metal (**\*cobalt-chromium**) because of its strength. (See also **PROSTHESIS**.) **Denture sore mouth** is inflammation of the gum under the denture, caused by a mixed infection of *Candida* and bacteria under a poorly cleaned denture or removable orthodontic appliance. **Denture hyperplasia** is an overgrowth of fibrous tissue covered by mucous membrane, which results from chronic irritation by a denture.

**Denys–Drash syndrome** a rare disorder consisting of the triad of **\*nephroblastoma** (Wilms' tumour), congenital nephropathy, and intersex disorders, resulting from mutations in the Wilms' tumour suppressor gene (*WT1*). Incomplete forms exist; congenital nephropathy, with diffuse mesangial sclerosis, is the constant feature with either Wilms' tumour or intersex disorders, usually in the form of male **\*pseudohermaphroditism**. [P. Denys (20th century), French physician; A. Drash (20th century), British physician]

**deodorant** *n.* an agent that reduces or removes unpleasant body odours by destroying bacteria that live on the skin and break down sweat. Deodorant preparations often contain an antiseptic.

**deontology** *n.* an approach to ethics that is concerned with what makes an action inherently right or wrong. Deontology's emphasis on the primacy of observing duties and respecting rights is at odds with the approach that judges actions by their outcomes (see **CONSEQUENTIALISM**). This tension is central to many issues in medical ethics; for example, in relation to **\*euthanasia**, the wrong of killing versus the good outcome of ending suffering, and is further complicated when rights or duties are in conflict with one another, e.g. in relation to **\*abortion**, the rights of the mother versus the rights of the fetus. See also **KANTIAN ETHICS**. —**deontological** *adj.*

**deoxycholic acid** *see* BILE ACIDS.

**deoxycorticosterone** *n.* a hormone, synthesized and released by the adrenal cortex, that regulates salt and water balance. *See also* CORTICOSTEROID.

**deoxyribonuclease** *n.* an enzyme, located in the \*lysosomes of cells, that splits DNA at specific places in the molecule.

**deoxyribonucleic acid** *see* DNA.

**Department of Health and Human Services (HHS)** the major US government agency providing health care. The department was created in 1953 and assumed its current name in 1980. HHS administers more than 300 health and health-related programmes and services, including \*Medicare and \*Medicaid. Other activities include research, immunization services, and providing financial assistance for low-income families. Almost a quarter of federal spending occurs through HHS.

**Department of Health and Social Care (DHSC)** (in Britain) a department of central government that supports the Secretary of State for Health and Social Care in meeting his or her obligations, which include the \*National Health Service, the promotion and protection of the health of the nation, and social care, including some oversight of personal social services provided by local authorities. The department is staffed by civil servants, including some health professionals. Following the reforms of the Health and Social Care Act 2012, the Department no longer has direct control of the NHS, which has passed to \*NHS England. The name of the department was expanded from 'Department of Health' in 2018. Equivalent departments support the ministers responsible for health services in Scotland, Wales, and Northern Ireland.

<https://www.gov.uk/government/organisations/department-of-health-and-social-care>

- DHSC section of the Gov.uk website: provides information on a wide range of public health issues

**dependence (drug dependence)** *n.* the physical and/or psychological effects produced by the habitual taking of certain drugs, characterized by a

compulsion to continue taking the drug; in ICD-11 (see [INTERNATIONAL CLASSIFICATION OF DISEASES](#)) it is known as **drug dependency syndrome**. In **physical dependence** withdrawal of the drug causes specific symptoms (**withdrawal symptoms**), such as sweating, vomiting, or tremors, that are reversed by further doses. Substances that may induce physical dependence include alcohol and the 'hard' drugs morphine, heroin, and cocaine. Dependence on 'hard' drugs carries a high mortality, partly because overdosage may be fatal and partly because their casual injection intravenously may lead to infections such as *\*hepatitis* and *\*AIDS*. Treatment is difficult and requires specialist skills. Much more common is **psychological dependence**, in which repeated use of a drug induces reliance on it for a state of wellbeing and contentment, but there are no physical withdrawal symptoms if use of the drug is stopped. Substances that may induce psychological dependence include nicotine, cannabis, barbiturates, cocaine, and amphetamines.

**dependent practitioner** in the USA, a paraprofessional or subprofessional health-care worker who is allowed to provide a limited amount of treatment to patients, usually under the supervision of a licensed practitioner, such as a physician. Examples include a nurse practitioner or occupational therapist.

**depersonalization** *n.* a state in which a person feels him- or herself becoming unreal or strangely altered, or feels that the mind is becoming separated from the body. Minor degrees of this feeling are common in normal people under stress. Severe feelings of depersonalization occur in *\*anxiety* disorder, in states of *\*dissociation*, in depression and schizophrenia, and in epilepsy (particularly temporal-lobe epilepsy). *See also* [DEREALIZATION](#); [OUT-OF-BODY EXPERIENCE](#).

**depilatory** *n.* an agent applied to the skin to remove hair.

**depolarization** *n.* the sudden surge of charged particles across the membrane of a nerve cell or a muscle cell that accompanies a physicochemical change in the membrane and cancels out, or reverses, its resting potential to produce an *\*action potential*. The passage of a *\*nerve impulse* is a rapid wave of depolarization along the membrane of a nerve fibre.

**depot injection** the administration of a sustained-action drug formulation that allows slow release and gradual absorption, so that the active agent can act for much longer periods than is possible with standard injections. Depot injections are usually given deep into a muscle; some contraceptive hormones are available in a depot formulation.

**depressant** *n.* an agent that reduces the normal activity of any body system or function. Drugs such as general *\*anaesthetics*, *\*barbiturates*, and opioids are depressants of the central nervous system and respiration. *\*Cytotoxic drugs*, such as azathioprine, are depressants of the levels of white blood cells.

**depression** *n.* **1.** a mental state characterized by excessive sadness. **2.** a mood disorder characterized by the pervasive and persistent presence of core and somatic symptoms on most days for at least two weeks. Core symptoms include low mood and loss or impairment of motivation, energy, interest, and enjoyment. Somatic symptoms include impaired memory and concentration, loss of appetite and libido, insomnia, early morning waking (more than two hours earlier than normal), physical and mental activity that is either agitated and restless or slow and retarded, and a diurnal variation of mood (usually patients feel particularly depressed in the mornings). Additional symptoms include automatic negative thoughts, pessimistic views of oneself, the future, and the present (**Beck's triad of depression**), suicidal *\*ideation*, tearfulness, *\*alexithymia*, and a poor frustration tolerance. A single period of experiencing these symptoms is called a **major depressive episode**; experiencing one or more of such episodes (without mania) is known as **major depression**, **major depressive disorder**, or **clinical depression**. Depression may or may not be triggered by stressful events or trauma. Risk factors include genetic and social elements (e.g. poverty, lack of confidants, substance abuse) and psychological elements (e.g. the presence of personality disorder, a history of abuse or *\*dysthymia*). Treatment is with *\*antidepressant* drugs, *\*cognitive behavioural therapy*, and/or *\*psychotherapy*. Severe cases may need *\*electroconvulsive therapy*. The course of the illness can be a single episode or recurrent episodes, or it may become chronic. —**depressive** *adj.*

**depressor** *n.* **1.** a muscle that causes lowering of part of the body. The **depressor labii inferioris** is a muscle that draws down and everts the lower lip. **2.** a nerve that lowers blood pressure.

**derealization** *n.* a feeling of unreality in which the environment is experienced as unreal and as flat, dull, or strange. The experience is unwelcome and often frightening. It occurs in association with **\*depersonalization** or with the conditions that cause depersonalization, for example schizophrenia, anxiety, depression, or **\*dissociative disorder**.

**derm-** (**derma-**, **dermo-**, **dermat(o)-**) *combining form denoting the skin.*

**-derm** *combining form denoting* **1.** the skin. **2.** a germ layer.

**Dermacentor** *n.* a genus of hard **\*ticks**, worldwide in distribution, the adults of which are parasites of humans and other mammals. The wood tick, *D. andersoni*, transmits Rocky Mountain spotted fever to humans in the western USA and the dog tick, *D. variabilis*, is the vector of this disease in the east.

**dermal** *adj.* relating to or affecting the skin, especially the **\*dermis**.

**Dermanyssus** *n.* a genus of widespread parasitic mites. The red poultry mite, *D. gallinae*, is a common parasite of wild birds in temperate regions but can also infest poultry. It occasionally attacks and takes a blood meal from humans, causing itching and mild dermatitis.

**dermatitis** *n.* an inflammatory condition of the skin caused by outside agents (*compare* **ECZEMA**, an endogenous disease in which such agents do not play a primary role, although some use the two terms interchangeably). **Irritant contact dermatitis** may occur in anyone who has sufficient contact with such irritants as acids, alkalis, solvents, and (especially) detergents. It is the commonest cause of **occupational dermatitis** in hairdressers, nurses, cooks, etc. (*See also* **NAPKIN RASH**.) In **allergic contact dermatitis** skin changes resembling those of eczema develop as a delayed (type IV) reaction to a particular allergen, which may be present at low concentrations. Common examples include nickel dermatitis (from costume jewellery, clothing fasteners, zips, etc.) and fragrance allergy (from toiletries, deodorants, perfumes, etc.). Treatment of dermatitis depends on identifying the allergen by **\*patch testing** and removing the cause, which is not always possible.

**Dermatitis herpetiformis** is an uncommon very itchy rash with symmetrical blistering, especially on the knees, elbows, buttocks, and shoulders. It is associated with **\*gluten** sensitivity and responds well to treatment with dapsone or a gluten-free diet.

**Dermatobia** *n.* a genus of nonbloodsucking flies inhabiting lowland woods and forests of South and Central America. The parasitic maggots of *D. hominis* can cause a serious disease of the skin in humans (see [MYIASIS](#)). The maggots burrow into the skin, after emerging from eggs transported by bloodsucking insects (e.g. mosquitoes), and produce painful boil-like swellings. Treatment involves surgical removal of the maggots.

**dermatochalasis** *n.* redundant eyelid skin, which may cause drooping of the upper lid. It usually occurs as a result of ageing. Compare [BLEPHAROCHALASIS](#).

**dermatofibrosarcoma protuberans** a tumour probably derived from [\\*histiocytes](#) that may occur in any part of the body. It is locally invasive but tends not to metastasize. It often recurs locally despite excision.

**dermatoglyphics** *n.* **1.** the patterns of finger, palm, toe, and sole prints. These patterns are formed by skin ridges, the distribution of which is unique to each individual. Abnormalities are found in those with chromosomal variants, such as [\\*Down's syndrome](#). **2.** the study of these patterns. In addition to its use in medicine, dermatoglyphics is also of value in criminology and is of interest to anthropologists. See also [FINGERPRINT](#).

**dermatology** *n.* the medical specialty concerned with the diagnosis and treatment of skin disorders. —**dermatological** *adj.* —**dermatologist** *n.*

**dermatology life quality index (DLQI)** a validated questionnaire designed by Finlay in 1994 to assess the impact of skin diseases on psychological and social wellbeing. It is the most common [\\*quality of life](#) tool used as an endpoint in dermatology clinical trials. DLQI scores of more than 10 (indicating a severe impact on life) are required before biological treatments for psoriasis may be administered in the UK.

**dermatome** *n.* **1.** a surgical instrument used for cutting thin slices of skin in some skin grafting operations. **2.** that part of the segmented mesoderm in the early embryo that forms the deeper layers of the skin (dermis) and associated tissues. See [SOMITE](#).

**dermatomyositis** *n.* an inflammatory disorder of the skin and underlying tissues, including the muscles (in the absence of a rash it is known as

**\*polymyositis**). The condition is one of the **\*connective-tissue diseases**. A pink/purple skin eruption occurs on the face, scalp, neck, shoulders, and knuckles (known as **Gotttron's papules**) and is later accompanied by severe swelling (*see also* **HELIOTROPE RASH**). Dermatomyositis is often associated with internal cancer in adults, though not in children.

**Dermatophagoides** *n.* a genus of **\*mites** that have been detected in samples of dust taken from houses in various parts of Europe. House-dust mites feed on human skin and scales and cause dermatitis of the scalp. Waste products from the mites produce an allergic response in susceptible people that is an important trigger for some forms of **\*rhinitis** and **\*asthma**.

**dermatophyte** *n.* a fungus belonging to any one of the three genera (*Microsporum*, *Trichophyton*, and *Epidermophyton*) that can feed on **\*keratin** and cause various forms of **\*ringworm** (tinea); these infections may be referred to as **dermatophytoses**.

**dermatosis** *n.* any disease of skin, particularly one without inflammation. In **juvenile plantar dermatosis**, which affects children up to the age of 14, the skin on the front of the sole becomes red, glazed, and symmetrically cracked. This condition, which settles spontaneously after a number of years, is believed to be related to the wearing of trainers.

**dermis (corium)** *n.* the true **\*skin**: the thick layer of living tissue that lies beneath the epidermis. It consists mainly of loose connective tissue within which are blood capillaries, lymph vessels, sensory nerve endings, sweat glands and their ducts, hair follicles, sebaceous glands, and smooth muscle fibres. —**dermal** *adj.*

**dermographism** *n.* a common local reaction caused by stroking the skin, which develops itchy **\*weals**. People with such highly sensitive skin can 'write' on it with a finger or blunt instrument. A rare delayed form exists. Dermographism can be confirmed with a calibrated instrument called a **dermographometer**. Antihistamines are first-line treatment.

**dermoid cyst (dermoid)** a benign tumour – a type of **\*teratoma** – containing developmentally mature skin complete with hair follicles and sebaceous glands, and often pockets of sebum, blood, fat, bone, nails, teeth, eyes, cartilage, and thyroid tissue, which may give rise to symptoms of

thyrotoxicosis. It is usually found at sites marking the fusion of developing sections of the body in the embryo and is the most common benign ovarian tumour in girls and young women. Sometimes a dermoid cyst may develop after an injury. Treatment is complete surgical removal, preferably in one piece and without any spillage of cyst contents. Tumours in the skin are best removed by a plastic surgeon. Because of the risks of surgery and anaesthesia to pregnant women, it is usually considered more feasible to remove bilateral dermoid cysts of the ovaries discovered during pregnancy only if they grow beyond 6 cm in diameter. The procedure is usually performed through laparotomy or very carefully through laparoscopy and should preferably be done in the second trimester.

**dermoscopy (dermatoscopy)** *n.* the process whereby skin lesions are examined by a **dermatoscope** (an instrument with a magnifier and a nonpolarized light source). The dermatoscope is pressed firmly on the skin with a liquid medium (e.g. oil) between the instrument and the skin. The technique allows closer examination of pigment networks, vascular structures, etc., and may help to distinguish benign from malignant lesions.

**descemetocele** *n.* thinning of the **\*stroma** of the cornea to such an extent that **\*Descemet's membrane** is all that is maintaining the integrity of the eyeball. It occurs in severe ulceration of the cornea.

**Descemet's membrane** the membrane that forms the deepest layer of the **\*stroma** of the cornea of the eye. The endothelium lies between it and the aqueous humour. [J. Descemet (1732–1810), French anatomist]

**desensitization** *n.* **1. (hyposensitization)** a method for reducing the effects of a known allergen by injecting, over a period, gradually increasing doses of the allergen, until resistance is built up. *See* **ALLERGY**. **2.** a technique used in the **\*behaviour therapy** of phobic states. The thing that is feared is very gradually introduced to the patient, first in imagination and then in reality. At the same time the patient is taught relaxation to inhibit the development of anxiety (*see* **RELAXATION THERAPY**). In this way he or she is able to cope with progressively closer approximations to the feared object or situation.

**desert** *n.* the state of deserving something. In medical ethics it is controversial to argue that some patients may be more deserving of treatment

than others on the basis of their past or present conduct. *See also* [NEED](#).

**desferrioxamine** *n.* a drug that combines with iron in body tissues and fluids and is used to treat iron poisoning, iron overload (including that resulting from prolonged or constant blood transfusion, as for thalassaemia), diseases involving iron storage in parts of the body (*see* [HAEMOCHROMATOSIS](#)), and for the diagnosis of such diseases.

**designer drug** a psychoactive drug produced by minor chemical modification of existing illegal substances so as to circumvent prohibitive legislation. These drugs are manufactured in secret laboratories for profit, without regard to any probable medical and social dangers to the consumers.

**desmoid tumour** a dense connective-tissue tumour with a dangerous propensity for repeated local recurrence after treatment. Intra-abdominal desmoids have an association with familial adenomatous [\\*polyposis](#) (FAP).

**DESMOND (diabetes education and self-management for ongoing and newly diagnosed)** a structured one-day education programme for patients with type 2 diabetes, developed in 2003. Outcomes show an increase in participants' understanding of diabetes and risk factors associated with coronary heart disease.

**desmoplasia** *n.* **1.** the proliferation of [\\*fibroblasts](#) to produce a fibrous [\\*stroma](#) in response to a malignant tumour. It is a feature of the more aggressive tumours. **2.** the formation of fibrous [\\*adhesions](#). —**desmoplastic** *adj.*

**desmopressin** *n.* a synthetic derivative of [\\*vasopressin](#) that causes a decrease in urine output and is used to treat diabetes insipidus and nocturnal [\\*enuresis](#). It is also effective in mild haemophilia and von Willebrand's disease. Side-effects include stomach cramps, headache, and flushing of the skin.

**desmosome** *n.* an area of contact between two adjacent cells, occurring particularly in epithelia. The cell membranes at a desmosome are thickened and fine fibres (**tonofibrils**) extend from the desmosome into the cytoplasm.

**desogestrel** *n.* a [\\*progestogen](#) used in various [\\*oral contraceptives](#), either alone or in combination with ethinylestradiol.

**desquamation** *n.* the process in which the outer layer of the **\*epidermis** of the skin is removed by scaling.

**detached retina** *see* **RETINAL DETACHMENT**.

**detergent** *n.* a synthetic cleansing agent that removes all impurities from a surface by reacting with grease and suspended particles, including bacteria and other microorganisms. Detergents are used for cleansing or as **\*antiseptics** and **\*disinfectants**.

**detoxification (detoxication)** *n.* **1.** the process whereby toxic substances are removed or toxic effects neutralized. It is one of the functions of the liver. **2.** the period of withdrawal when a person stops long-term consumption of alcohol or some other drug. Withdrawal symptoms (e.g. **\*delirium tremens**) may occur during detoxification.

**detrition** *n.* the process of wearing away solid bodies (e.g. bones) by friction or use.

**detrusor** *n.* the muscle of the urinary bladder wall. The functioning of the detrusor and urethral sphincter is assessed by a urodynamic investigation (*see* **URODYNAMICS**). This is used to diagnose dysfunction, absent and exaggerated reflexes, and overactivity of the muscle (**detrusor instability, overactive bladder syndrome**). Neurogenic detrusor overactivity is due to neurological damage, as occurs in multiple sclerosis or in suprasacral spinal cord injury.

**detumescence** *n.* **1.** the reverse of erection, whereby the erect penis or clitoris becomes flaccid after orgasm. **2.** subsidence of a swelling.

**deut- (deuto-, deuter(o-))** *combining form denoting two, second, or secondary.*

**deuteranopia** *n.* a defect in colour vision in which reds, yellows, and greens are confused. It is thought that the mechanisms for perceiving red light and green light are in some way combined in people with this defect. *Compare* **PROTANOPIA**; **TRITANOPIA**. *See also* **COLOUR BLINDNESS**.

**deutoplasm** *n.* *see* **YOLK**.

**developmental delay** considerable delay in the physical or mental development of children when compared with their peers. There are many causes. **Global delay** is when there is delay in several areas of development (gross motor skills, fine motor skills and vision, language and hearing, personal and social).

**developmental disorder** any one of a group of conditions in infancy or childhood, that are characterized by delays in biologically determined psychological functions, such as language. They are more common in males than females and tend to follow a course of disability with gradual improvement. They are classified into **pervasive** conditions, in which many types of development are involved (e.g. **\*autism**), and **specific** disorders, in which the disability is an isolated problem (such as **\*dyslexia**).

**developmental milestones** skills gained by a developing child, which should be achieved by a given age. Examples of such milestones include smiling by six weeks and sitting unsupported by eight months. Failure to achieve a particular milestone by a given age is indicative of **\*developmental delay**. See table.

Developmental milestones					
	6 weeks Supine infant	6–9 months Sitting infant	1 year Standing/walking infant	18–24 months Mobile toddler	3–4 years Communicating child
Gross motor	Symmetrical movements of all limbs When prone raises head	Supports head Sits unaided (6 m) Stands holding on (7 m) Pulls to standing (9 m)	Walks holding onto furniture (9 m) Walks if led A few steps unsupported (12 m)	Walks with normal gait Climbs steps Kicks ball (20 m)	Hops on one foot
Fine motor/ vision	Fixes and follows gaze	Reaches for objects Palmar grasp Transfers objects hand to hand Bangs toys together	Pincer grip (10 m)	Scribbles (14 m) Builds tower of six blocks (24 m)	Copies circle (3 y) Copies square (4 y) Builds bridge or steps with blocks when shown
Language/ hearing	Normal cry Responds to sounds	Turns to a voice (7 m) Nonspecific babble (10 m)	Understands simple commands: 'No' Says a few words appropriately: 'Mama' 'Dada' (13 m) Turns to own name	Combines two different words (20 m) Points to one named body part	Gives first and last name Recognizes colours (3 y) Speech fully comprehensible (4 y)
Social	Regards face Smiles responsively	Puts solid food in mouth (6 m) Waves goodbye (8 m)	Drinks from cup (12 m) Wary of strangers	Feeds self with spoon Removes clothing Asserts own wishes Symbolic play with miniature toys	Washes hands with help Eats with knife and fork Make-believe play Shows sympathy appropriately Likes hearing and telling stories
(Median ages of achievement of each skill in brackets)					

**deviance** *n.* variation from normal behaviour beyond the limits acceptable to the majority of the conforming peer group; particularly (though not

exclusively) applied to sexual habits (*see also* [SEXUAL DEVIATION](#)).

**deviation** *n.* **1.** (in ophthalmology) any abnormal position of one or both eyes. For example, if the eyes are both looking to one side when the head is facing forwards, they are said to be **deviated** to that side. Such deviations of both eyes may occur in brain disease. Deviations of one eye, such as *\*dissociated vertical deviation*, come into the category of squint (*see* [STRABISMUS](#)). **2.** *see* [SEXUAL DEVIATION](#).

**Devic's disease** *see* [NEUROMYELITIS OPTICA](#). [E. Devic (1869–1930), French physician]

**devitalization** *n.* (in dentistry) **1.** tooth death, normally as a result of disease, trauma, or (less commonly) orthodontic treatment. **2.** the removal of a diseased pulp from a tooth. In primary teeth the coronal pulp alone may be removed, while the pulp in the root is kept alive or root canal treatment undertaken. For permanent teeth, *see* [ROOT CANAL TREATMENT](#).

**dew-point hygrometer** *see* [HYGROMETER](#).

**DEXA (dual-energy X-ray absorptiometry)** a method of measuring bone density based on the proportion of a beam of photons that passes through the bone. The results of a DEXA scan are expressed as a *\*T score*. *See also* [OSTEOPOROSIS](#).

**dexamethasone** *n.* a *\*corticosteroid* drug used principally to treat severe allergies, eye inflammation, rheumatic and other inflammatory conditions, and congenital adrenal hyperplasia. Side-effects include sodium and fluid retention, muscle weakness, convulsions, vertigo, headache, and hormonal disturbances (including menstrual irregularities). In the form of an implant into the vitreous humour, it is also used to treat oedema associated with *\*retinal* vein occlusion. Dexamethasone is also used in a series of tests for Cushing's syndrome (*see* [DEXAMETHASONE SUPPRESSION TESTS](#)).

**dexamethasone suppression tests (DSTs)** tests based on the principle that appropriate doses of *\*dexamethasone* can suppress the output of cortisol from the adrenal glands in the normal state and that this ability is reduced or lost in *\*Cushing's syndrome*. In the **overnight DST** 1 mg of dexamethasone is administered at midnight and the serum cortisol level is measured at 9.00 am

the next morning. Failure to suppress cortisol output may indicate Cushing's syndrome but also occurs in patients with obesity and depressive illness. In the **low-dose DST** (0.5 mg dexamethasone every 6 hours for 48 hours), cortisol suppression occurs in patients with obesity and depression but not in those with Cushing's syndrome. In the **high-dose DST** (2 mg dexamethasone every 6 hours for 48 hours), cortisol is suppressed in patients with Cushing's disease (in which excess amounts of ACTH are secreted by the pituitary gland) but not in those with Cushing's syndrome due to other causes. Although the low- and high-dose tests are unreliable, all three tests should be performed to aid the diagnosis of Cushing's syndrome.

**dexamfetamine (dexamphetamine)** *n. see* [AMPHETAMINES](#).

**dextr- (dextro-)** *combining form denoting* **1.** the right side. Example: **dextroposition** (displacement to the right). **2.** (in chemistry) dextrorotation.

**dextran** *n.* a carbohydrate, consisting of branched chains of glucose units, that is a storage product of bacteria and yeasts. Preparations of dextran solution are used in transfusions, to increase the volume of plasma.

**dextrin** *n.* a carbohydrate formed as an intermediate product in the digestion of starch by the enzyme amylase. Dextrin is used in the preparation of pharmaceutical products (as an **\*excipient**) and surgical dressings.

**dextrocardia** *n.* a congenital defect in which the position of the heart is a mirror image of its normal position, with the apex of the ventricles pointing to the right. It may be associated with other congenital defects and is often combined with **situs invertus**, in which the appendix and liver lie on the left side of the abdomen and the stomach lies on the right side. Isolated dextrocardia produces no adverse effects.

**dextrose** *n. see* [GLUCOSE](#).

**DFT** dental foundation training: *see* [FOUNDATION TRAINING](#).

**DHA (docosahexaenoic acid)** *see* [OMEGA-3 FATTY ACIDS](#).

**DHEA** *see* [DEHYDROEPIANDROSTERONE](#).

**DI** *see* [ARTIFICIAL INSEMINATION](#).

**di-** *prefix denoting two or double.*

**dia-** *prefix denoting 1. through. 2. completely or throughout. 3. apart.*

**diabetes** *n.* any disorder of metabolism causing excessive thirst and the production of large volumes of urine. Used alone, the term most commonly refers to **\*diabetes mellitus**. *See also* **DIABETES INSIPIDUS**; **HAEMOCHROMATOSIS** (BRONZE DIABETES). —**diabetic** *adj., n.*

**diabetes insipidus** a rare metabolic disorder in which the patient produces large quantities of dilute urine and is constantly thirsty. It is due to deficiency of the pituitary hormone **\*vasopressin** (antidiuretic hormone), which regulates reabsorption of water in the kidneys, and is treated by administration of the hormone. *See also* **WATER-DEPRIVATION TEST**.

**diabetes mellitus** a disorder of carbohydrate metabolism leading to an abnormally high blood sugar (glucose) level (hyperglycaemia). As the blood sugar rises the typical symptoms of urinary frequency and increased thirst emerge. Tiredness, blurring of vision, and weight loss are also common. The long-term complications of diabetes are damage to the eye (**\*retinopathy**), the kidney (**\*diabetic nephropathy**), and the nerve supply to the feet (**\*diabetic neuropathy**), as well as accelerated vascular disease leading to coronary heart disease or stroke. These can be delayed or avoided by good control of blood glucose levels, combined with blood pressure control and a healthy lifestyle. **Type 1 diabetes** is an autoimmune disease in which the **\*insulin**-producing beta cells of the pancreas are damaged or destroyed, thought to be triggered by a viral environmental factor. It typically starts in childhood or adolescence (more than 80% of type 1 diabetes is diagnosed in people under the age of 20 years). Treatment with insulin injections needs to be started within a few weeks of the onset of symptoms and is almost invariably lifelong. **Type 2 diabetes** is a genetically determined resistance to insulin action on target tissues, primarily the liver, skeletal muscle, and adipose tissue, and has become increasingly common in the UK and the developed world with the associated rise in obesity. People with type 2 diabetes outnumber those with type 1 diabetes by at least ten to one. The mainstay of treatment is a healthy diet, regular physical activity, weight control, and avoidance of tobacco in conjunction with **\*oral hypoglycaemic drugs**. Insulin treatment is often required after 5–10 years from diagnosis,

although less likely in people who have followed successful lifestyle management and have lost weight over time. A relatively new class of injectable treatment – the **\*GLP-1 receptor agonists** – can help with both blood glucose and weight control. The rarer forms of diabetes mellitus include **\*maturity-onset diabetes of the young** (MODY) and diabetes secondary to destruction of the pancreas (e.g. by pancreatitis, pancreatic cancer, and surgery). **\*Gestational diabetes mellitus** is any form of diabetes first diagnosed in pregnancy.

**Diabetes UK** the main British support charity for patients with diabetes and workers in the diabetes field.

<https://www.diabetes.org.uk/>

- Website of Diabetes UK: supplies recent research as well as information on living with type 1 and type 2 diabetes (including recipes)

**diabetic amyotrophy** an acute mononeuropathy of the femoral nerve, usually of microvascular origin, associated with chronic poor diabetic control. Symptoms are thigh pain and progressive weakness of knee extension. Examination reveals wasting of the quadriceps muscle group and loss of the knee jerk. It may affect both legs and recovery is usually slow. Treatment is with physiotherapy and improved control of the diabetes; the condition never seems to recur in the same leg. The main **\*differential diagnosis** is of compression of the nerve roots in the spinal canal.

**diabetic glomerulosclerosis** the characteristic microscopic changes seen in a diabetic kidney after many years of progressive damage.

**diabetic hand syndrome** the combination of features, often found in the hands of long-standing diabetic subjects, consisting of **\*Dupuytren's contractures**, knuckle pads, **\*carpal tunnel syndrome**, **\*cheiroarthropathy**, and sclerosing **\*tenosynovitis**.

**diabetic holiday foot syndrome** a condition in which patients with diabetic sensory polyneuropathy (see **DIABETIC NEUROPATHY**) suffer significant trauma to their insensate feet through holiday activities. These may include

walking on hot flagstones or sand and wearing ill-fitting shoes. The condition may be prevented with prior education and advice and by maintaining safe footcare practices.

**diabetic honeymoon period** a well-recognized period just after the diagnosis of type 1 *\*diabetes mellitus* when only very low insulin doses are required to control the condition. It lasts from months to a few years but inevitably ends, when dose requirements will increase quite quickly.

**diabetic ketoacidosis (DKA)** a metabolic state resulting from a profound lack of insulin, usually found only in type 1 *\*diabetes mellitus* but sometimes arising in people of Afro-Caribbean ethnicity with type 2 diabetes. Inability to inhibit glucose production from the liver results in *\*hyperglycaemia*, which can be extreme and lead to severe dehydration. The concurrent failure to suppress fatty-acid production from adipose tissue results in the excess conversion of fatty acids to ketones in the liver (*\*ketosis*) and the development of a metabolic *\*acidosis*, which can be severe. Patients often present with vomiting (from the ketosis), which contributes to the dehydration. The condition is treated as a medical emergency with intravenous fluid and insulin; patients should be monitored in high-dependency units.

**diabetic nephropathy** progressive damage to the kidneys seen in some people with long-standing diabetes. Excessive leakage of protein into the urine is followed by gradual decline of the kidney function and even kidney failure. *See also* [DIABETIC GLOMERULOSCLEROSIS](#).

**diabetic neuropathy** progressive damage to the peripheral nerves seen in some people with long-standing diabetes. It most commonly affects the legs, causing pain or numbness working up from the feet. There is no cure but drugs can sometimes be used to control the discomfort experienced, and good blood glucose control may prevent deterioration over time. *See also* [DIABETIC HOLIDAY FOOT SYNDROME](#).

**diabetic retinopathy** *see* [RETINOPATHY](#).

**diabetologist** *n.* a doctor who specializes in the diagnosis and treatment of *\*diabetes mellitus* and the prevention of its long-term complications. In the UK most diabetologists are also endocrinologists.

**diaclast** *n.* a surgical instrument used for the destruction of the skull of a fetus. This rare procedure enables a dead fetus to be delivered through the birth canal (*see* [DECAPITATION](#)).

**diagnosis** *n.* the process of determining the nature of a disorder by considering the patient's *\*signs* and *\*symptoms*, medical background, and – when necessary – results of laboratory tests and X-ray examinations. Unlike therapeutic procedures, diagnostic processes usually do not directly benefit the patient in terms of treatment. *See also* [DIFFERENTIAL DIAGNOSIS](#); [PRENATAL DIAGNOSIS](#). *Compare* [PROGNOSIS](#). —**diagnostic** *adj.*

**Diagnostic and Statistical Manual of Mental Disorders** *see* [DSM](#).

**diagnostic peritoneal lavage** the instillation of saline directly into the abdominal cavity and its subsequent aspiration a few minutes later. If the fluid is bloodstained on recovery an intra-abdominal haemorrhage is indicated. This is a useful diagnostic tool in trauma patients.

**diakinesis** *n.* the final stage in the first prophase of *\*meiosis*, in which homologous chromosomes, between which crossing over has occurred, are ready to separate.

**dialysate** *n.* fluid used in the dialysis process. In *\*haemodialysis* the dialysate is purified tap water to which has been added a precise amount of electrolyte solution. In *\*peritoneal dialysis* the dialysate is a commercially produced fluid containing electrolytes with glucose, glucose polymers, or amino acids.

**dialyser (dialyzer)** *n.* a medical device designed to allow controllable transfer of solutes and water across a semipermeable membrane separating blood and *\*dialysate* solutions flowing countercurrent to each other. Most modern dialysers are based on hollow-fibre technology and are tube-shaped. Blood enters the top of the tube and travels, by capillary action, down a large number of hollow microfibres, which are embedded in polyurethane at each end of the dialyser tube for support. Dialysate enters the tube from the side, near the bottom of the tube. It runs in the opposite direction to the blood, around the hollow fibres and separated from the blood by the semipermeable membrane that constitutes the microfibre wall. A number of different dialyser membranes are in use, displaying a wide variety of permeabilities (related to

pore size), biocompatibilities (not activating *\*cytokine* or alternate pathway *\*complement* responses in the blood), and costs.

**dialysis** *n.* a method of separating particles of different dimensions in a liquid mixture, using a thin semipermeable membrane whose pores are too small to allow the passage of large particles, such as proteins, but large enough to permit the passage of dissolved crystalline material. A solution of the mixture is separated from distilled water by the membrane; the solutes pass through the membrane into the water while the proteins, etc., are retained. The principle of dialysis is used in the *\*dialyser* (see also *HAEMODIALYSIS*). The peritoneum is used as an autogenous semipermeable membrane in the technique of *\*peritoneal dialysis*.

**diamorphine** *n.* the chemical name for heroin: a powerful opioid analgesic (see *OPIATE*) that is administered orally or by injection for the relief of acute and chronic pain, especially in terminal illness, and pulmonary oedema.

**Dianette** *n.* see *CYPROTERONE*.

**diapedesis** *n.* migration of cells through the walls of blood capillaries into the tissue spaces. Diapedesis is an important part of the reaction of tissues to injury (see *INFLAMMATION*).

**diaphoresis** *n.* the process of sweating, especially excessive sweating. See *SWEAT*.

**diaphoretic (sudorific)** *n.* a drug that causes an increase in sweating. *\*Antipyretic* drugs have diaphoretic activity, which helps reduce the body temperature in fevers.

**diaphragm** *n.* **1.** (in anatomy) a thin musculomembranous dome-shaped muscle that separates the thoracic and abdominal cavities. The diaphragm is attached to the lower ribs at each side and to the breastbone and the backbone at the front and back. It bulges upwards against the heart and the lungs, arching over the stomach, liver, and spleen. There are openings in the diaphragm through which the oesophagus, blood vessels, and nerves pass. The diaphragm plays an important role in *\*breathing*. It contracts with each inspiration, becoming flattened downwards and increasing the volume of the thoracic cavity. With each expiration it relaxes and is restored to its dome

shape. **2.** a hemispherical rubber cap fitted inside the vagina over the neck (cervix) of the uterus as a contraceptive. When combined with the use of a chemical spermicide the diaphragm provides reliable contraception with a failure rate as low as 2–10 pregnancies per 100 woman-years.

**diaphyseal aclasia** *see* **EXOSTOSIS**.

**diaphysis** *n.* the body, or shaft, of a long bone, which ossifies from a primary centre. It comprises a thick cylinder of compact bone surrounding a large medullary cavity. *Compare* **EPIPHYSIS**; **PHYSIS**. —**diaphyseal** *adj.*

**diaphysitis** *n.* inflammation of the diaphysis (shaft) of a bone, through infection or rheumatic disease. It may result in impaired growth of the bone and consequent deformity.

**diarrhoea** *n.* frequent bowel evacuation or the passage of abnormally soft or liquid faeces. It may be caused by intestinal infections, inflammation (such as **\*ulcerative colitis** or **\*Crohn's disease**), **\*malabsorption**, anxiety, drugs, and **\*irritable bowel syndrome**. Severe or prolonged diarrhoea may lead to excessive loss of water, salts, and nutrients.

**diarthrosis (synovial joint)** *n.* a freely movable joint. The ends of the adjoining bones are covered with a thin cartilaginous sheet, and the bones are linked by a ligament (**capsule**) lined with **\*synovial membrane**, which secretes synovial fluid (see illustration). Such joints are classified according to the type of connection between the bones and the type of movement allowed. *See* **ARTHRODIC JOINT**; **CONDYLARTHROSIS**; **ENARTHROSIS**; **GINGLYMUS**; **SADDLE JOINT**; **TROCHOID JOINT**.

**A diarthrosis.**

**diaschisis** *n.* a temporary loss of reflex activity in the brainstem or spinal cord following destruction of the cerebral cortex. As time passes this state of suppressed reflex activity is replaced by one of unduly exaggerated reflexes and spasticity of the limbs.

**diastase** *n.* an enzyme that hydrolyses starch in barley grain to produce maltose during the malting process. It has been used to aid the digestion of starch in some digestive disorders.

**diastema** *n.* a gap between two teeth.

**diastole** *n.* the period between two contractions of the heart, when the muscle of the heart relaxes and allows the chambers to fill with blood. The term usually refers to **ventricular diastole**, which lasts about 0.5 seconds in a normal heart rate of about 70/minute. During exertion this period shortens, so allowing the heart rate to increase. *See also* **BLOOD PRESSURE**; **SYSTOLE**.  
—**diastolic** *adj.*

**diastolic dysfunction** impairment of heart function due to increased stiffness of the left **\*ventricle**, which results in reduced capacity of the heart to fill with blood during diastole. The clinical effects of this are described as heart failure with normal ejection fraction (HFNFE). *Compare* **SYSTOLIC DYSFUNCTION**.

**diastolic pressure** *see* **BLOOD PRESSURE**.

**diathermy** *n.* the production of heat in a part of the body by means of a high-frequency electric current passed between two electrodes. Diathermy is utilized to coagulate tissues and seal off blood vessels, thus effecting **\*haemostasis**. In **bipolar diathermy** electric current passes between the two electrodes of the instrument. In **monopolar diathermy** the instrument is one electrode, the other being a large pad applied to another part of the patient's body. Examples of instruments used to deliver diathermy include **diathermy knives, forceps, and scissors**. **Diathermy snares** and **needles** can be used to destroy unwanted tissue and to remove small superficial neoplasms. *See also* **ELECTROSURGERY**.

**diathesis** *n.* a higher than average tendency to acquire certain diseases, such as allergies, rheumatic diseases, or gout. Such diseases may run in families, but they are not inherited.

**diazepam** *n.* a long-acting **\*benzodiazepine** used for the short-term relief of acute anxiety and insomnia and in the treatment of delirium tremens, status epilepticus, and febrile convulsions; it is also used as a **\*premedication**. Diazepam is administered by mouth, injection, or rectally and can cause dependence; side-effects include drowsiness and lethargy, confusion, and muscle weakness.

**diazoxide** *n.* a drug given to treat conditions in which the levels of blood sugar are chronically low (including **\*insulinoma**).

**DIC** *see* **DISSEMINATED INTRAVASCULAR COAGULATION**.

**dicephalus** *n. see* **CRANIOPAGUS**.

**dichorionicity** *n. see* **CHORIONICITY**; **TWINS**. —**dichorionic** *adj.*

**dichromatic** *adj.* describing the state of colour vision of those who can appreciate only two of the three primary colours. People with such vision match any given colour by a mixture of the two they can distinguish. *Compare* **TRICHROMATIC**.

**Dick test** an obsolete immunological test for susceptibility to **\*scarlet fever**. [G. F. Dick (1881–1967) and G. R. H. Dick (1881–1963), US physicians]

**diclofenac** *n.* an anti-inflammatory drug (*see* NSAID) used to relieve joint pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, acute gout, and actinic *\*keratosis*, and also for pain relief after surgery. Possible side-effects include abdominal pain, nausea, and diarrhoea; gastric ulceration can be prevented by administering diclofenac in combination with *\*misoprostol*.

**dicophane** *n.* *see* DDT.

**dicrotism** *n.* a condition in which the pulse is felt as a double beat for each contraction of the heart. It may be seen in typhoid fever. —**dicrotic** *adj.*

**dicycloverine (dicyclomine)** *n.* an *\*antimuscarinic* drug that reduces spasms of smooth muscle and is used as an *\*antispasmodic* to relieve irritable bowel syndrome and related conditions. Side-effects include dry mouth, thirst, and dizziness.

**didanosine (ddI)** *n.* an antiretroviral drug that interferes with the action of the enzyme *\*reverse transcriptase*, by means of which HIV, the cause of AIDS, is able to incorporate itself into the human host cell. In combination with other antiretroviral drugs, it is used to treat HIV infection and AIDS. Possible side-effects include damage to nerves, severe pancreatitis, nausea, vomiting, and headache.

**DIDMOAD syndrome** *see* WOLFRAM SYNDROME.

**didym-** (**didymo-**) *combining form denoting the testis.*

**dieldrin** *n.* an insecticide that attacks the central nervous system of insects and has proved useful in the control of various beetles, flies, and larvae that attack crops. Because of its persistence in and contamination of the environment, its use in the UK is now severely restricted.

**diencephalon** *n.* an anatomical division of the forebrain, consisting of the epithalamus, thalamus (dorsal thalamus), hypothalamus, and ventral thalamus (subthalamus). *See* BRAIN.

**diet** *n.* **1.** the mixture of foods that a person eats. A **balanced diet** contains the correct proportions of all the nutrients, i.e. vitamins, minerals (calcium, phosphorus, potassium, sodium, chlorine, sulphur, magnesium, the *\*trace elements*), and *\*dietary fibre*, as well as water, carbohydrates and fats

(which provide energy), and proteins (required for growth and maintenance).

**2.** a restrictive regime of food intake used by an individual to lose weight.

**dietary fibre (roughage)** nonstarch polysaccharides (NSP), which cannot be digested and absorbed to produce energy; specifically, sources of NSP that do not contain lignin or resistant starch. Fibre is divided into two types: **insoluble** (cellulose and hemicelluloses) and **soluble** (pectins). Highly refined foods, such as sucrose, do not contain dietary fibre. Foods with a high fibre content include wholemeal cereals, vegetables, nuts, and fruit. A diet high in insoluble fibre (e.g. wheat bran, wholegrain and wholemeal bread and cereals) may help prevent bowel diseases, such as constipation, diverticulitis, and colon cancer. Soluble fibre (e.g. oats, barley, beans, pulses, fruit, and vegetables) slows the reabsorption of **\*bile** salts and so helps to lower cholesterol as well as dampening the glycaemic response to glucose (see **GLYCAEMIC INDEX**). A high-fibre diet used to be the first-line advice for irritable bowel syndrome; however, a low **\*FODMAP** diet can be more effective.

**Dietary Reference Values (DRVs)** a set of statistical terms used to describe nutritional requirements.

**EAR** estimated average requirement: the amount of energy or a nutrient that will meet the needs of 50% of the population.

**RDA** recommended daily amount: the average amount of a nutrient that should be provided per head of a group of people if the needs of practically all members of the group are to be met.

**LRNI** lowest recommended nutrient intake: the amount of a nutrient that provides only 2.5% of the population with their requirements.

**RNI** reference nutrient intake: the amount that is sufficient for almost 97.5% of individuals in a population. It is the term usually used when expressing dietary requirements.

**safe level:** used when there is insufficient data to determine the RNI, set as the average requirement plus 20%.

**RI** reference intake: a guide to how many calories and nutrients an average person can consume each day for a healthy balanced diet. This is used in labelling information for energy, protein, carbohydrate, sugars, fat, saturated fat, fibre, and salt.

**dietetics** *n.* the application of the principles of **\*nutrition** to the selection of food and the feeding of individuals and groups. It is practised by **dietitians**, who use the most up-to-date public health and scientific research on food, health, and disease, which they translate into practical guidance to enable people to make appropriate lifestyle and food choices.

**diethylcarbamazine** *n.* an anthelmintic drug that destroys filariae and is therefore used in the treatment of filariasis and loiasis. Side-effects may include headache, malaise, joint pains, nausea, and vomiting.

**diethylstilbestrol (DES)** *n.* a synthetic female sex hormone (*see* **OESTROGEN**) that was prescribed in the 1950s and 1960s to prevent miscarriage. It was subsequently found to increase the risk of cancers of the uterus, ovary, and breast, particularly the risk of **\*clear-cell carcinoma** of the genital tract in the daughters of patients who were treated with it. Although licensed to treat breast cancer in postmenopausal women and prostate cancer, DES is rarely used because of its toxicity.

**Dietl's crisis** acute obstruction of a kidney causing severe pain in the loins. The obstruction usually occurs at the junction of the renal pelvis and the ureter, causing the kidney to become distended with accumulated urine (*see* **HYDRONEPHROSIS**). Sometimes the pelvis drains spontaneously, with relief of pain, but acute decompression of the kidney may be required with surgical relief of the obstruction (**\*pyeloplasty**). [J. Dietl (1804–78), Polish physician]

**Dieulafoy's lesion** an abnormality of small blood vessels (microscopically, an arteriovenous malformation), identified predominantly in the mucosal lining of the upper stomach, that may cause severe spontaneous haemorrhage. It can rarely be found in the duodenum, colon, jejunum, or oesophagus. If detected endoscopically, curative therapy is often possible, although the abnormality is often difficult to see at gastroscopy. Surgical exploration may be required if the bleeding is unresponsive to endoscopic treatment. [G. Dieulafoy (1839–1911), French physician]

**differences of sexual development (DSDs)** *see* **INTERSEX**.

**differential diagnosis** **\*diagnosis** of a condition whose signs and/or symptoms are shared by various other conditions. For example, abdominal

pain may be due to any of a large number of different disorders, most of which must be ruled out in arriving at a correct diagnosis.

**differential leucocyte count (differential blood count)** a determination of the proportions of the different kinds of white cells (leucocytes) present in a sample of blood. Usually 100 white cells are counted and classified under the microscope or by electronic apparatus, so that the results can readily be expressed as percentages of the total number of leucocytes and the absolute numbers per litre of blood. The information often aids diagnosis of disease.

**differentiation** *n.* **1.** (in embryology) the process in embryonic development during which unspecialized cells or tissues become specialized for particular functions. **2.** (in oncology) the degree of similarity of tumour cells to the structure of the organ from which the tumour arose. Tumours are classified as well, moderately, or poorly differentiated: well differentiated tumours appear similar to the cells of the organ in which they arose; poorly differentiated tumours do not. Such classification is often of prognostic significance and determines the *\*grade* of the tumour. Well-differentiated tumours are low-grade; poorly differentiated tumours are high-grade.

**diffuse oesophageal spasm** a disorder affecting the gullet (oesophagus) in which uncoordinated, sometimes simultaneous, oesophageal contractions precipitate difficulty in swallowing (*\*dysphagia*), regurgitation of food, and chest pain. The cause is unclear. Diagnosis is suggested by characteristic appearances during a *\*barium swallow* (corkscrew oesophagus) and confirmed by oesophageal manometry. Medical treatment comprises the use of calcium-channel blockers, nitrates, and sildenafil; endoscopic treatment may include infiltration of *\*botulinum toxin* in specific oesophageal segments and, infrequently, endoscopic dilatation. Surgical myotomy is reserved for extreme cases.

**diffusion tensor imaging** a variant of *\*diffusion weighted imaging* in which both the direction and the amount of diffusion of water molecules in a tissue are coded in the image. This MRI technique can be valuable in linear structures, such as nerves and muscle fibres. In the brain the major tracts and their communications can be studied with this technique (*see TRACTOGRAPHY*).

**diffusion weighted imaging** a method of creating images by \*magnetic resonance imaging that relies on the amount of available space that individual water molecules have to move in, which depends on the local microstructure. Pathological tissues generally are less organized, with more space for diffusion and a higher signal.

**di George syndrome** a hereditary condition resulting in an inability to fight infections (immunodeficiency) associated with absence of the parathyroid gland and the thymus, abnormalities of the heart, and low calcium levels. Affected children are prone to \**Candida* infections and often present with \*failure to thrive. The condition has also been named **CATCH-22**: Cardiac abnormalities, Abnormal facies, T-cell deficiency (from absent thymus), Cleft palate, Hypocalcaemia, chromosome 22 (in which the defect lies). [A. M. di George (1921–2009), US paediatrician]

**digestion** *n.* the process in which ingested food is broken down in the alimentary canal into a form that can be absorbed and assimilated by the tissues of the body. Digestion includes mechanical processes, such as chewing, churning, and grinding food, as well as the chemical action of digestive enzymes and other substances (bile, acid, etc.). Chemical digestion begins in the mouth with the action of \*saliva on food, but most of it takes place in the stomach and small intestine, where the food is subjected to \*gastric juice, \*pancreatic juice, and \*succus entericus.

**digit** *n.* any one of the terminal divisions of a limb: a finger or toe.

**digital** *adj.* **1.** (in anatomy) relating to a digit. **2.** (in radiology) relating to or utilizing \*digitization.

**digital hearing aid** *see* HEARING AID.

**digital image** an image made up of \*pixels. Each pixel has numbers (digits) to describe its position and shade on the \*grey scale. The more shades available, described by the number of computer bits required to store the shade of grey, the more accurately the image represents the original tissue contrast. An 8-bit computer image shows  $2^8$  (256) possible shades of grey, close to the maximum the human eye can differentiate. 12-bit (4096 levels of grey) images are of much higher quality and take up more memory. They can

be manipulated more easily by computer using image enhancement techniques. Compare [ANALOGUE IMAGE](#).

**digitalis** *n.* an extract from the dried leaves of foxgloves (*Digitalis* species), which contains various substances, including the [\\*glycoside \\*digoxin](#) (known as a **cardiac glycoside**), which stimulates heart muscle and is used medicinally.

**digitalization** *n.* the administration of a derivative of [\\*digitalis](#) to a patient with heart failure until the optimum level has been reached in the heart tissues. At this stage the control of heart failure should be adequate and there should be few side-effects. The process of digitalization may take several days.

**digital radiography (DR)** an alternative to film radiography, by acquiring X-ray images from a large number of individual X-ray detectors on a matrix in a digital format directly. This contrasts with [\\*computerized radiography](#), in which an [\\*analogue image](#) is taken and then put into a reader to be converted into a [\\*digital image](#). The technique allows the storage of images and their subsequent retrieval, manipulation, and interpretation using computers (*see* [PACS](#)).

**digital spot imaging (DSI)** the production of static images using an [\\*image intensifier](#), usually during a fluoroscopic examination. The images can be stored digitally (*see* [DIGITIZATION](#)) and either transferred to photographic film or viewed on a TV monitor.

**digital subtraction** a radiological technique that enhances visualization of blood vessels (*see* [ANGIOGRAPHY](#)). A digitized image is taken before the contrast medium (a 'mask') is injected, and this is subtracted by computer from the images taken after contrast injection. Only the blood vessels remain on the image. The technique enables blood-vessel anatomy and blood supply to an organ to be demonstrated more clearly. The quality of the image is very dependent on the patient remaining still, since movement causes severe loss of image (movement [\\*artifact](#)). The technique can also be used in nuclear medicine using two different tracers to look for parathyroid gland tumours.

**digitization** *n.* (in radiology) the conversion of an [\\*analogue image](#) to a [\\*digital image](#). The image is broken down to pixels and numerical values

assigned to each pixel for its position and to describe its shade on the *\*grey scale*. This allows storage, electronic manipulation, and transfer via computer links of any images, including radiographs or CT, MRI, or ultrasound scans.

**dignity** *n.* (in clinical practice) a patient's sense that they are respected as an individual and that they are not being exposed unnecessarily or without their agreement to procedures they might find degrading. The preservation of dignity is important whenever people are undressed, asked very personal questions, seen by more than one clinician, discussed in a group in the third person, or involved in activities that are not essential (such as teaching). Clinical failures here may lead to lack of compliance with treatment (see *ADHERENCE*) or even *\*complaint* or depression (because of humiliation and loss of self-worth). Dignity is important when patients have lost abilities or have learning difficulties, and is vital in the care of any client group where help is needed with personal functions or when someone is *\*dying*. *See also AUTONOMY*.

**digoxin** *n.* a cardiac glycoside – a drug extracted from *\*digitalis* – that increases the force of heart muscle contraction and decreases heart rate. It is used mainly to control atrial fibrillation. Possible side-effects include nausea, vomiting, loss of appetite, diarrhoea, abdominal pain, and abnormal heart activity.

**dihydrocodeine** *n.* an opioid *\*analgesic* used to relieve moderate to severe pain (*see OPIATE*). It sometimes causes nausea, dizziness, and constipation. Dependence of the *\*morphine* type can also occur, but this is rare. Dihydrocodeine may be administered in combination with *\*paracetamol* (as **co-dydramol**).

**dihydrofolate reductase inhibitor** any of various drugs that interfere with the conversion of folate to its active form in the body. They include *\*pyrimethamine*, *\*trimethoprim*, and *\*methotrexate*. When such drugs are necessary, folate deficiency is treated with *\*folinic acid* rather than folic acid.

**dihydrotestosterone (DHT)** *n.* a product formed from the action of the enzyme 5 $\alpha$ -reductase on *\*testosterone*. Mostly derived from the peripheral conversion of testosterone, some DHT is also secreted directly by the testes.

DHT is an estimated 2.5 times more potent than testosterone but is present in much smaller amounts in the circulation.

**diiodotyrosine** *n.* an iodine-containing substance produced in the thyroid gland from which the **\*thyroid hormones** are derived.

**dilaceration** *n.* a condition affecting some teeth after traumatic injury, in which the incomplete root continues to form at an abnormal angle to the part already formed. In severe cases it may be necessary to remove the tooth.

**dilatation** *n.* the enlargement or expansion of a hollow organ (such as a blood vessel) or cavity.

**dilatation and curettage (D and C)** an operation in which the cervix (neck) of the uterus is dilated, using an instrument called a **\*dilator**, and the lining (endometrium) of the uterus is lightly scraped off with a manual curette (*see* **CURETTAGE**) or removed by suction using an aspirator. It is performed for a variety of reasons, including the removal of any material remaining after miscarriage and obtaining an endometrial biopsy for histological examination.

**dilator** *n.* **1.** an instrument used to enlarge a body opening or cavity. For example, a dilator can be used to widen the male urethra if it becomes narrowed by disease. Dilators (such as Hegar's dilator) are also used to enlarge the canal in the cervix of the uterus in the procedure of **\*dilatation and curettage**. **2.** a drug, applied either locally or systemically, that causes expansion of a structure, such as the pupil of the eye or a blood vessel. *See also* **VASODILATOR**. **3.** a muscle that, by its action, opens an aperture or orifice in the body.

**diltiazem** *n.* a **\*calcium-channel blocker** used in the prevention and treatment of angina and high blood pressure (hypertension), acting as a vasodilator. Side-effects include oedema, headache, nausea, dizziness, and skin rash. Diltiazem may also be administered as a topical cream for chronic anal fissures.

**dimethyl sulfoxide (DMSO)** a drug that is instilled (in solution) into the bladder for the relief of symptoms of **\*interstitial cystitis**.

**dimeticone (dimethicone)** *n.* a silicone preparation used to treat head lice; it forms a coating around the parasites that prevents their excretion of water. Dimeticone is also included in various **\*barrier creams** (with antiseptics and astringents) to prevent undue drying of the skin and protect it against irritating external agents. *See also* **SIMETICONE**.

**dinoprostone** *n.* a **\*prostaglandin** drug used mainly to induce labour.

**dioctyl sodium sulphasuccinate** *see* **DOCUSATE SODIUM**.

**diode laser** a type of laser whose medical uses include treating diseases of the retina, by producing small burns in the retina (*see* **PHOTOCOAGULATION**), and selected cases of glaucoma (cyclophotocoagulation). It is also used for treating varicose veins (*see* **ENDOVENOUS LASER TREATMENT**).

**diopetre** *n.* the unit of measurement of the power of **\*refraction** of a lens. One diopetre is the power of a lens that brings parallel light rays to a focus at a point one metre from the lens, after passing through it. A stronger lens brings light rays to a focus at a point closer to it than a weaker lens and has a higher dioptric power.

**Dioralyte** *n. see* **ORAL REHYDRATION THERAPY**.

**dipeptidase** *n.* an enzyme, found in digestive juices, that splits certain products of protein digestion (dipeptides) into their constituent amino acids. The latter are then absorbed by the body.

**dipeptide** *n.* a compound consisting of two amino acids joined together by a peptide bond (e.g. glycylalanine, a combination of the amino acids glycine and alanine). *See* **DIPEPTIDASE**.

**diphenoxylate** *n. see* **CO-PHENOTROPE**.

**diphtheria** *n.* an acute highly contagious infection, caused by the bacterium *Corynebacterium diphtheriae*, generally affecting the throat but occasionally other mucous membranes and the skin. The disease is spread by direct contact with a patient or carrier or by contaminated milk. After an incubation period of 2–6 days a sore throat, weakness, and mild fever develop. Later, a soft grey membrane forms across the throat, constricting the air passages and

causing difficulty in breathing and swallowing; a *\*tracheostomy* may be necessary. Bacteria multiply at the site of infection and release a toxin into the bloodstream, which damages heart and nerves. Death from heart failure or general collapse can follow within 4 days but prompt administration of antitoxin and penicillin arrests the disease. An effective immunization programme has now made diphtheria rare in most Western countries (*see also* **SCHICK TEST**).

**diphtheroid** *adj.* resembling diphtheria (especially the membrane formed in diphtheria) or the bacteria that cause it.

**diphyllobothriasis** *n.* an infestation of the intestine with the broad tapeworm, *\*Diphyllobothrium latum*, which sometimes causes nausea, malnutrition, diarrhoea, and anaemia resulting from impaired absorption of vitamin B<sub>12</sub> through the gut. The infestation, common in Baltic countries, is contracted following ingestion of uncooked fish infected with the larval stage of the tapeworm. The tapeworm can be expelled from the gut with the anthelmintic *\*mepacrine*.

**Diphyllobothrium** *n.* a genus of large tapeworms that can grow to a length of 3–10 m. The adult of *D. latum*, the broad (or fish) tapeworm, infects fish-eating mammals including humans, in whom it may cause serious anaemia (*see* **DIPHYLLOBOTHRIASIS**). The parasite has two intermediate hosts: a freshwater crustacean and a fish (*see also* **PLEROCERCOID**).

**dipipanone** *n.* a potent opioid *\*analgesic* drug used in combination with *\*cyclizine* to relieve moderate or severe pain. It may cause drowsiness.

**dipl-** (**diplo-**) *combining form denoting* double.

**diplacusis** *n.* perception of a single sound as double owing to a defect of the *\*cochlea* in the inner ear.

**diplegia** *n.* paralysis involving both sides of the body and affecting the legs more severely than the arms. **Cerebral diplegia** is a form of *\*cerebral palsy* in which there is widespread damage, in both cerebral hemispheres, of the brain cells that control the movements of the limbs. —**diplegic** *adj.*

**diplococcus** *n.* any of a group of nonmotile parasitic spherical bacteria that occur in pairs. The group includes the *\*pneumococcus*.

**diploë** *n.* the lattice-like tissue that lies between the inner and outer layers of the **\*skull**.

**diploid** *adj.* describing cells, nuclei, or organisms in which each chromosome except the Y sex chromosome is represented twice. *Compare* **HAPLOID**; **TRIPLOID**. —**diploid** *n.*

**diplopia** *n.* double vision: the simultaneous awareness of two images of one object. It is usually due to limitation of movement of one eye so that the two eyes cannot simultaneously look at the same object. This may be caused by a defect of the nerves or muscles controlling eye movement or a mechanical restriction of eyeball movement in the orbit (**binocular diplopia**). Double vision that does not disappear on covering one eye (**monocular diplopia**) can be caused by early cataract (*see also* **POLYOPIA**).

**diplotene** *n.* the fourth stage in the first prophase of **\*meiosis**, in which **\*crossing over** occurs between the paired chromatids of homologous chromosomes, which then begin to separate.

**diprosopus** *n.* a fetal disorder, with a single trunk and normal limbs but with some degree of duplication of the face.

**dipsomania** *n.* morbid and insatiable craving for alcohol, occurring in paroxysms. A small proportion of alcoholics show this symptom (*see* **ALCOHOLISM**). The term (meaning ‘compulsive thirst’) has occasionally been used in relation to individuals with schizophrenia, who drink water or juices excessively.

**Diptera** *n.* a large group of insects, including **\*mosquitoes**, gnats, midges, house flies, and **\*tsetse** flies, that possess a single pair of wings. The mouthparts of many species, e.g. mosquitoes and tsetse flies, are specialized for sucking blood; these forms are important in the transmission of disease (*see* **VECTOR**). *See also* **FLY**.

**Dipylidium** *n.* a genus of tapeworms. *D. caninum*, a common parasite of the small intestine of dogs and cats, occasionally infects humans but usually produces no obvious symptoms. Fleas are the intermediate hosts, and children in close contact with pets become infected on ingesting fleas harbouring the parasite.

**dipyridamole** *n.* a drug that dilates the blood vessels of the heart and reduces platelet aggregation. It is given by mouth to prevent thrombosis around prosthetic heart valves. It may cause headache, stomach upsets, and dizziness. A combination of modified-release dipyridamole and aspirin is given to prevent recurrent stroke in patients who have had a transient ischaemic attack or an ischaemic stroke.

**directly observed therapy (DOT)** *see* TUBERCULOSIS.

**director** *n.* an instrument used to guide the extent and direction of a surgical incision.

**direct oral anticoagulant (DOAC)** a relatively recently introduced class of drugs that reduce coagulation of the blood by inhibition of one of the coagulation factors (Factor Xa). They may be used as an alternative to \*warfarin in many (but not all) cases, their advantage being that regular blood tests are not required for dose adjustment. Examples include, apixaban, dabigatran, edoxaban, and rivaroxaban.

**Director of Public Health (DPH)** a senior public health consultant or specialist in a local authority. Responsibilities include advising on the health needs of the local population. *See also* PUBLIC HEALTH CONSULTANT; PUBLIC HEALTH SPECIALIST.

**dis-** *prefix denoting separation.*

**disability** *n.* a substantial long-term restriction of functional ability or activity as a result of \*impairment of the body or mind. Most modern definitions of disability, including that supplied by the World Health Organization, recognize that it is a complex condition that includes a social dimension. In other words, an individual's experience of being disabled may in part reflect social and environmental factors that deny opportunities and full participation in society. *See also* HANDICAP.

**disability-adjusted life year (DALY)** a common research measure of disease burden that accounts for both morbidity and mortality. One year lived in full health is equivalent to one DALY. Disabilities and disease states are assigned a weighting that reduces this figure, such that a year lived with disability is equivalent to less than one DALY. Some studies also use **social**

**weighting**, in which years lived as a young adult receive a greater DALY weight than those lived as a young child or older adult. *See also* [HEALTH-ADJUSTED LIFE EXPECTANCY](#); [QUALITY OF LIFE](#).

**disability living allowance (DLA)** (in Britain) a state benefit payable to help with the extra costs of looking after a child under the age of 16 with special needs. It has two components: a care component, payable at three rates to children needing help with personal care; and a mobility component, payable at two rates to those aged 3 years or over who need help with walking. The rates depend on the level of help required. DLA for adults aged 16–64 years has been replaced by the [\\*personal independence payment](#) (PIP). People aged over 65 years with a disability and requiring help may be eligible for the **attendance allowance**.

**Disability Rights Commission** *see* [EQUALITY AND HUMAN RIGHTS COMMISSION](#).

**disaccharide** *n.* a carbohydrate consisting of two linked [\\*monosaccharide](#) units. The most common disaccharides are [\\*maltose](#), [\\*lactose](#), and [\\*sucrose](#).

**disarticulation** *n.* separation of two bones at a joint. This may be the result of an injury or it may be done by the surgeon at operation in the course of amputation; for example of a limb, finger, or toe.

**disc** *n.* (in anatomy) a rounded flattened structure, such as an [\\*intervertebral disc](#) or the [\\*optic disc](#).

**disc cupping** an abnormal enlargement of the central depression of the [\\*optic disc](#) due to loss of nerve fibres, as occurs in glaucoma.

**discectomy** *n.* surgical removal of part (**partial discectomy**) or all (**total discectomy**) of a diseased or damaged intervertebral disc. It is performed for the relief of neurological symptoms arising from a displaced intervertebral disc compressing a nerve root or the spinal cord (*see* [PROLAPSED INTERVERTEBRAL DISC](#)) or as part of a more extensive procedure. *See also* [MICRODISCECTOMY](#).

**disc herniation** displacement of an intervertebral disc through a tear in the fibrous outer coat of the disc. *See* [PROLAPSED INTERVERTEBRAL DISC](#).

**discoid lupus erythematosus (DLE)** *see* LUPUS ERYTHEMATOSUS.

**discontinuation syndrome** symptoms that arise from the sudden cessation of certain centrally acting drugs, such as antidepressants, beta blockers, and antihypertensives. Experiences include a rebound effect in which the original symptoms return but are temporarily worse than before, flulike symptoms and headaches, nausea, and giddiness that is usually short-lived and stops within 36 hours. This syndrome is not a sign of addiction and it does not indicate dependency.

**discrimination** *n.* treating individuals differently on the basis of morally insignificant characteristics, such as race, sex, or religion. In medicine, any discrimination of this kind (e.g. when deciding on treatments or allocating resources) offends against the ethical principle of *\*justice*. Legally, discrimination can be direct (i.e. overtly differentiating between people and groups) or indirect (i.e. behaviour that will disproportionately affect particular people or some groups more than others). *See also* EQUALITY; STIGMA.

**disease** *n.* a disorder with a specific cause (which may or may not be known) and recognizable signs and symptoms; any bodily abnormality or failure to function properly, except that resulting directly from physical injury (the latter, however, may open the way for disease). It is often contrasted with **illness**, where the abnormal symptoms, thoughts, or feelings may be subjective and difficult to assess objectively.

**disease-modifying antirheumatic drug (DMARD)** any of various drugs used in the treatment of rheumatic disease: they affect the progression of the disease by suppressing the disease process. DMARDs include drugs affecting the immune response (immunomodulators), such as *\*immunosuppressants* (e.g. methotrexate) and *\*cytokine inhibitors*; *\*gold salts*; *\*penicillamine*; *\*sulfasalazine*; and *\*hydroxychloroquine*.

**disembarkment syndrome** *see* MAL DE DEBARQUEMENT.

**disimpaction** *n.* **1.** the process of separating the broken ends of a bone when they have been forcibly driven together during a fracture. **2.** (**faecal disimpaction**) *see* CONSTIPATION.

**disinfectant** *n.* an agent that destroys or removes bacteria and other microorganisms. In medicine disinfectants are used to cleanse unbroken skin. An example is **\*cetrimide**.

**disinfection** *n.* the process of eliminating infective microorganisms from contaminated instruments, clothing, or surroundings by using physical means or chemicals (**\*disinfectants**).

**disinfestation** *n.* the destruction of insect pests and other animal parasites. This generally involves the use of insecticides applied either topically, as in delousing, or as a spray for eliminating an infestation of fleas or bed bugs in the home.

**disjunction** *n.* the separation of pairs of homologous chromosomes during meiosis or of the chromatids of a chromosome during **\*anaphase** of mitosis or meiosis. *Compare* **NONDISJUNCTION**.

**dislocation (luxation)** *n.* displacement from their normal position of bones meeting at a joint such that there is complete loss of contact of the joint surfaces. It usually results from trauma (e.g. dislocation of the shoulder, which is common in sports injuries, and dislocation of the mandible from the temporomandibular joint) but may be congenital, in which case it usually affects the hip (*see* **CONGENITAL DISLOCATION OF THE HIP**). In a traumatic dislocation the bones are restored to their normal positions by manipulation under local or general anaesthesia (*see* **REDUCTION**). *Compare* **SUBLUXATION**.

**dismemberment** *n.* the separating of body parts or the amputation of a leg, arm, or part of a limb.

**disodium pamidronate** *see* **PAMIDRONATE**.

**disoma** *n.* a double-bodied fetus with a single head.

**disopyramide** *n.* an **\*anti-arrhythmic** drug used to treat supraventricular and ventricular arrhythmias. Side-effects such as dry mouth, blurred vision, difficulty in urination, and digestive upsets may occur.

**disorders of sexual development (DSDs)** *see* **INTERSEX**.

**disorganized schizophrenia** *see* [HEBEPHRENIA](#).

**disorientation** *n.* the state produced by loss of awareness of space, time, or personality. It can be the result of drugs, mental illness, or organic disease and is one of the symptoms tested for in the [\\*mental state examination](#).

**dispensary** *n.* a place where medicines are made up by a pharmacist according to the doctor's prescription and dispensed to patients. A dispensary is often part of an out-patient department in a hospital.

**dispensing practice** (in Britain) a general practice with a dispensary on site to issue prescribed medications to patients. *See also* [GENERAL PRACTITIONER](#).

**displacement** *n.* (in psychology) the substitution of one type of behaviour for another, usually the substitution of a relatively harmless activity for a harmful one; for example, kicking the cat instead of one's boss.

**dissection** *n.* the cutting apart and separation of the body tissues along the natural divisions of the organs and different tissues in the course of an operation. In [\\*interventional radiology](#), dissection refers specifically to pathological dissection of the intimal layer of an aorta or artery that allows blood to pass through [\\*subintimal](#) space. This may result in occlusion of the vessel branches. Dissection of corpses is carried out for the study of anatomy.

**disseminated** *adj.* widely distributed in an organ (or organs) or in the whole body. The term may refer to disease organisms or to pathological changes.

**disseminated intravascular coagulation (DIC)** a condition resulting from overstimulation of the blood-clotting mechanisms in response to disease or injury, such as severe infection, malignancy, acute leukaemia, burns, severe trauma, or severe haemorrhage during childbirth (*see also* [ABRUPTIO PLACENTAE](#)). The overstimulation results in generalized blood coagulation and excessive consumption of coagulation factors. The resulting deficiency of these may lead to spontaneous bleeding. Transfusions of fresh frozen plasma, platelets, and cryoprecipitate are given along with blood to replace the depleted clotting factors; treatment of the underlying cause is essential.

**disseminated sclerosis** *see* [MULTIPLE SCLEROSIS](#).

**dissociated vertical deviation (DVD)** a condition in which one eye looks upwards when the amount of light entering it is reduced, e.g. when it is covered. The eye returns to its original position when the cover is removed. DVD is an acquired condition chiefly associated with infantile esotropia (convergent **\*strabismus**). The deviation is dissociated since there is no movement of the focusing (i.e. uncovered) eye during the deviation or return phase.

**dissociation** *n.* (in psychiatry) the process whereby thoughts and ideas can be split off from consciousness and may function independently, thus (for example) allowing conflicting opinions to be held at the same time about the same object. Dissociation may be the main factor in cases of dissociative **\*fugue** and multiple personalities.

**dissociative disorder** any one of a group of mental disorders characterized by a partial or complete loss of the normal integration between awareness of one's own identity, memories of the past, and control of bodily movements. They tend to remit spontaneously after hours, days, or months. The symptoms are explained psychoanalytically as extreme **\*defence mechanisms**. They include loss of memory for important personal details (*see* **AMNESIA**), wandering away from home (*see* **FUGUE**), the assumption of a new identity, and trancelike states with severely reduced response to external stimuli. **\*Conversion disorder** is classified with dissociative disorders (as dissociative (conversion) disorders) in ICD-10 (*see* **INTERNATIONAL CLASSIFICATION OF DISEASES**).

**distal** *adj.* **1.** (in anatomy) situated away from the origin or point of attachment or from the median line of the body. For example, the term is applied to a part of a limb that is furthest from the body; to a blood vessel that is far from the heart; and to a nerve fibre that is far from the central nervous system. *Compare* **PROXIMAL**. **2.** (in dentistry) describing the surface of a tooth away from the midline of the jaw.

**distichiasis** *n.* a very rare condition in which there is an extra row of eyelashes behind the normal row. They may rub on the cornea.

**distraction** *n.* (in orthopaedics) increasing the distance between two points. In **\*limb lengthening** procedures callus can be stretched longitudinally by

increasing the distance between pins attached to the bone (see [CALLOTASIS](#)).

**distraction test** a hearing test used for screening infants between the ages of six and ten months. The infant is placed on its carer's knee, one examiner sits in front of the infant and gains its attention, and a second examiner is situated just behind the infant. At a given moment the first examiner becomes very still and the second examiner makes a sound at the level of the infant's ear to one side or the other. If the infant can hear it turns in the direction of the sound. The sounds made should be of different pitches and a given loudness.

**distribution** *n.* the dispersion of a set of observations (e.g. of heights, weights, or blood pressures) about their arithmetic [\\*mean](#). A **normal** or **Gaussian distribution** is a continuous distribution that is symmetrical around the mean value and in which a large majority of the observations fall within one [\\*standard deviation](#) of the mean in either direction: such a distribution forms the familiar symmetrical bell curve when plotted on a graph. In a **skewed** or **asymmetrical distribution**, the measurements are clustered on one side of the mean and spread out over a wider range on the other. *See also* [FREQUENCY DISTRIBUTION](#); [SIGNIFICANCE](#).

**district nurse** a trained nurse with special training in [\\*domiciliary services](#), usually employed by a clinical commissioning group or health board. District nurses may also be allocated to a designated general practice, an arrangement known as [\\*attachment](#).

**disulfiram** *n.* a drug used in the treatment of chronic alcoholism. It acts as a deterrent by producing unpleasant effects when taken with alcohol, including flushing, breathing difficulties, headache, palpitations, nausea, and vomiting. Common side-effects are fatigue, nausea, and constipation.

**dithranol** *n.* a drug applied to the skin to treat [\\*psoriasis](#).

**diuresis** *n.* increased secretion of urine by the kidneys. This normally follows the drinking of more fluid than the body requires, but it can be stimulated by the administration of a [\\*diuretic](#). A temporary diuresis can also occur following the relief of urinary tract obstruction.

**diuretic** *n.* a drug that increases the volume of urine produced by promoting the excretion of salts and water from the kidney. The main classes of diuretics act by inhibiting the reabsorption of salts and water from the kidney

tubules into the bloodstream. **Thiazide diuretics** (e.g. *\*bendroflumethiazide*, *\*chlortalidone*) act at the distal convoluted tubules (see **NEPHRON**), preventing the reabsorption of sodium and potassium. **Potassium-sparing diuretics** (e.g. *\*amiloride*, *\*spironolactone*, *\*triamterene*) prevent excessive loss of potassium at the distal convoluted tubules, and **loop diuretics** (e.g. *\*furosemide*) prevent reabsorption of sodium and potassium in *\*Henle's loop*. Diuretics are used to reduce the oedema due to salt and water retention in disorders of the heart, kidneys, liver, or lungs. Thiazides and potassium-sparing diuretics are also used – in conjunction with other drugs – in the treatment of high blood pressure. Treatment with thiazide and loop diuretics often results in potassium deficiency; this is corrected by simultaneous administration of potassium salts or a potassium-sparing diuretic.

**diurnal** *adj.* relating to the daylight hours; daily. See **CIRCADIAN**.

**diurnal variation of mood** a common symptom of *\*depression*, in which the patient regularly experiences different mood states at different times of day. Classically, a depressed patient will complain of particularly low mood in the morning and this gradually improves during the day.

**divarication** *n.* the separation or stretching of bodily structures. **Rectus divarication** is stretching of the *\*rectus abdominis* muscle, a common condition associated with pregnancy or obesity.

**divaricator** *n.* **1.** a scissor-like surgical instrument used to divide portions of tissue into two separate parts during an operation. **2.** a form of retractor used to open out the sides of an abdominal incision and facilitate access.

**divergence** *n.* **1.** (in ophthalmology) simultaneous abduction of the eyes. **Divergence excess** is a divergent squint (see **STRABISMUS**) in which the eyes are deviated outwards more when looking in the distance than when looking at near objects. **Divergence insufficiency** is a convergent squint (see **STRABISMUS**) in which the eyes are deviated slightly inwards only when looking in the distance. **2.** (in ethics) a difference of opinion.

**diverticular disease** a condition in which there are diverticula (see **DIVERTICULUM**) in the colon associated with symptoms. Symptoms in uncomplicated disease may include lower abdominal pain (usually left-sided) and altered stool frequency or consistency. The pain is often due to

spasm of the muscle of the intestine, but other factors may be involved. The cause of the disease has historically been ascribed to low-fibre diets, but recent evidence challenges this hypothesis.

**diverticulitis** *n.* inflammation of a **\*diverticulum**, most commonly of one or more colonic diverticula. Faecal stasis or obstruction in a colonic diverticulum predisposes to bacterial infection and ischaemia, precipitating acute inflammation. Clinical symptoms include abdominal pain and fever with or without a change in bowel habit. Blood tests reveal leucocytosis. A minority of patients may develop complications, including abscess formation, rectal bleeding, fistulae, **\*strictures**, and peritonitis. Surgery is often required in complicated diverticulitis. *Compare* **DIVERTICULAR DISEASE**.

**diverticulosis** *n.* the presence of noninflamed diverticula (*compare* **DIVERTICULITIS**).

**diverticulum** *n.* (*pl.* **diverticula**) a sac or pouch formed at weak points in the walls of the gastrointestinal tract. They may be caused by increased pressure from within (**pulsion diverticula**) or by pulling from without (**traction diverticula**). A **pharyngeal diverticulum** occurs in the pharynx and may cause difficulty in swallowing. **Oesophageal diverticula** occur in the middle or lower oesophagus (gullet); they may be associated with muscular disorders of the oesophagus but rarely cause symptoms. **Gastric diverticula**, which are rare, affect the stomach (usually the upper part) and cause no symptoms. **Duodenal diverticula** occur on the concave surface of the duodenal loop; they are usually asymptomatic but a small minority may be associated with **\*dyspepsia**, choledocholithiasis, and an increased risk of pancreatitis. **Jejunal diverticula** affect the small intestine, are often multiple, and may give rise to abdominal discomfort, diarrhoea, and **\*malabsorption** due to overgrowth of bacteria within them. **Meckel's diverticulum** occurs in the ileum, about 35 cm from its termination, as a congenital abnormality. It may become inflamed, mimicking **\*appendicitis**; if it contains embryonic remnants of stomach mucosa it may form a **\*peptic ulcer**, causing pain, bleeding, or perforation. **Colonic diverticula**, affecting the colon (particularly the left side), become commoner with increasing age and often cause no symptoms. However they are sometimes associated with abdominal

pain or altered bowel habit (*see* [DIVERTICULAR DISEASE](#)) or they may become inflamed (*see* [DIVERTICULITIS](#)).

**division** *n.* **1.** the separation of an organ or tissue into parts by surgery. **2.** *see* [CELL DIVISION](#).

**Dix–Hallpike test (Hallpike test)** a test for *\*benign paroxysmal positional vertigo* (BPPV), performed with the patient first sitting upright on an examination couch and then lying supine with the head and neck extended beyond the edge of the couch. The patient's head is rotated to the left (or right) and supported by the examiner while the patient assumes the supine position and keeps his or her eyes focused on the examiner's eyes. The test is then repeated with the other ear facing down. In patients with BPPV, after a short delay rotatory *\*nystagmus* is seen, in association with severe vertigo and nausea, which gradually abates. The effect diminishes with repeated manoeuvres. In conditions affecting the cerebellum or brainstem, the nystagmus occurs immediately, in any direction, and does not diminish, and patients do not feel especially nauseated. [M. R. Dix and C. S. Hallpike (20th century), British otologists]

**dizygotic twins** *see* [TWINS](#).

**DLE** discoid lupus erythematosus. *See* [LUPUS ERYTHEMATOSUS](#).

**DLQI** *see* [DERMATOLOGY LIFE QUALITY INDEX](#).

**DMARD** *see* [DISEASE-MODIFYING ANTIRHEUMATIC DRUG](#).

**DMD (Duchenne muscular dystrophy)** *see* [MUSCULAR DYSTROPHY](#).

**DMSA** *dimercaptosuccinic acid*, which when labelled with *\*technetium-99m* is used as a tracer to obtain *\*scintigrams* of the kidney, by means of a *\*gamma camera*. DMSA binds to the proximal tubules of the kidney. It is used particularly to show renal scarring, resulting from infection, and to assess the relative quantity of functioning tissue in each kidney.

**DNA (deoxyribonucleic acid)** the genetic material of nearly all living organisms, which controls heredity and is located in the cell nucleus (*see* [CHROMOSOME](#); [GENE](#)). DNA is a *\*nucleic acid* composed of two strands made up of units called *\*nucleotides* (see illustration). The two strands are

wound around each other into a double helix and linked together by hydrogen bonds between the bases of the nucleotides (see [BASE PAIRING](#)). The genetic information of the DNA is contained in the sequence of bases along the molecule (see [GENETIC CODE](#)); changes in the DNA cause *\*mutations*. The DNA molecule can make exact copies of itself by the process of *\*replication*, thereby passing on the genetic information to the daughter cells when the cell divides.

**DNA** Structure of part of a DNA molecule.

**DNA polymerase inhibitor** any one of a class of antiviral drugs that inhibit the action of DNA polymerase enzymes, which are used by viruses to form their own DNA. These drugs prevent, to a varying degree, the reproduction of viruses. They include *\*aciclovir*, *\*foscarnet*, *\*ganciclovir*, and *\*valaciclovir*.

**DNA repair** a variety of mechanisms that help to ensure that the genetic sequence, as expressed in the DNA, is maintained and that errors that occur during DNA replication, by mutation, are not allowed to accumulate. An error in the genetic sequence could cause cell death by interfering with the

replication process. DNA repair involves the action of enzymes, which detect damage to DNA and effect the repair. Some genetic diseases, including *\*ataxia telangiectasia* and *\*xeroderma pigmentosum*, are due to deficiencies in these enzymes.

**DNAR order** Do Not Attempt Resuscitation order: an instruction, usually made by a patient while he or she has capacity and recorded in their notes, requesting that doctors desist from performing resuscitation in the event of physiological failure. By respecting a patient's choice with regard to resuscitation, a doctor is respecting that patient's *\*autonomy*. If resuscitation is considered *\*futile*, a decision not to attempt it may be taken; ideally, this should be communicated to the patient and the reasons explained sensitively.

**DNase** *n.* an enzyme that catalyses the cleavage of DNA. A genetically engineered form, recombinant human DNase (**dornase alfa**), is used in the treatment of *\*cystic fibrosis* to reduce the viscosity of the sticky secretions in the lungs. Administered by inhalation via a jet nebulizer, it appears to hydrolyse extracellular DNA that accumulates with other neutrophil debris in the airways. Trade name: **Pulmozyme**.

**DOAC** *see* **DIRECT ORAL ANTICOAGULANT**.

**dobutamine** *n.* an *\*inotropic* *\*sympathomimetic* drug (a  $\beta_1$  agonist) used to increase the force of contraction of the ventricles and improve the heart output, for example in patients who have had a *\*myocardial infarction* or in cases of septic shock. It is given by intravenous infusion.

**docetaxel** *n.* a *\*taxane* used in the treatment of breast cancer, advanced or metastatic *\*non-small-cell lung cancer*, and metastatic prostate cancer that is resistant to hormonal treatment. Side-effects are as for all *\*cytotoxic drugs*, but also typically include hypersensitivity reactions, neuropathy, and leg oedema.

**Doctor** *n.* **1.** a courtesy title given to a qualified medical practitioner, i.e. one who has been registered by the *\*General Medical Council* (GMC). Most doctors in the UK obtain bachelors' degrees in medicine and surgery (MB, BS) or the diplomas of the conjoint boards of the Royal Colleges of Physicians and Surgeons of England and Scotland or the Society of Apothecaries (e.g. LRCP, MRCS, LMSSA): these degrees or diplomas are

required by the GMC before a person is provisionally registered as a doctor. Normally it is also necessary to undertake training under the medical *\*Foundation Programme* in a hospital recognized for this purpose. Such a doctor has the title **foundation doctor** and is debarred from independent practice. Thereafter doctors undertake further training to be eligible for full registration on the GMC's specialist or GP registers (see *Appendix 9*). Surgeons in the UK do not use the title Doctor and are referred to, as a mark of distinction, as Mr, Mrs, or Ms. Qualified dentists also use the courtesy title Doctor. *See also* *CONSULTANT. 2.* the title given to a recipient of a higher university degree than a Master's degree (this is usually a Doctor of Philosophy (PhD or DPhil) degree). The degree *Medicinae Doctor* (MD) is awarded by some British universities as a research degree to those with a first degree in medicine. In the US, the degree is awarded on qualification.

**doctrine of double effect** the principle that, where it is foreseen that a single action will have both a good and a bad outcome, a person may perform such an action provided that (a) he or she intends only the positive outcome, (b) the bad outcome is not disproportionate to the good, and (c) the good outcome is not a direct consequence of the bad. The classic example occurs where a terminally ill patient requires high doses of opiates for pain relief that may also depress respiratory function and hasten his or her death. In such a case the law holds that the doctor may supply the necessary dosage without this being considered tantamount to *\*euthanasia*, even though the outcome will be the same, i.e. the morality of the action does not lie in its consequences (*see* *CONSEQUENTIALISM*).

**docusate sodium (dioctyl sodium sulphosuccinate)** a stimulant *\*laxative* and softening agent that is used to relieve constipation and prepare the bowel for radiological examination. It may cause abdominal cramps. It is also used in ear drops to soften earwax.

**dolich- (dolicho-)** *combining form denoting long*. Example: **dolichocolon** (abnormally long colon).

**dolichocephaly** *n.* the condition of having a relatively long narrow skull, with a *\*cephalic index* of 75 or less. The head of a fetus in a breech presentation is often dolichocephalic. —**dolichocephalic** *adj.*

**dolor** *n.* pain: one of the classical signs of inflammation in a tissue, the other three being **\*calor** (heat), **\*rubor** (redness), and **\*tumor** (swelling). The pain in inflammation is thought to be due to the release of chemicals from damaged cells.

**dolorimetry** *n.* the measurement of pain. See **ALGESIMETER**.

**domiciliary consultation** **1.** a house call by a **\*general practitioner** made at the request of a patient or the patient's carer. It is commonly referred to as a **home visit**. **2.** (in Britain) an arrangement in the **\*National Health Service** whereby a hospital specialist, at the request of a general practitioner, visits to advise on the diagnosis or treatment of a patient who, on medical grounds, is unable to attend hospital. The specialist receives special remuneration for this service.

**domiciliary midwife** see **COMMUNITY MIDWIFE**.

**domiciliary services** (in Britain) health and social services that are available in the home and are distinguished from hospital-based services. They include the services of such personnel as community nurses employed by care trusts (see **DISTRICT NURSE**; **COMMUNITY MIDWIFE**; **HEALTH VISITOR**) and social workers and care assistants employed by social service departments of local authorities. The term **community services** is applied to these services.

**dominant** *adj.* (in genetics) describing a gene (or its corresponding characteristic) whose effect is shown in the individual whether its **\*allele** is the same or different. If the allele is different it is described as **\*recessive** and its effect is masked. In genetic diseases showing **autosomal dominant** inheritance, the defective gene is dominant and will therefore be inherited by 50% of the offspring (of either sex) of a person with the disease. It will always be expressed in these offspring (since the normal allele inherited from the unaffected parent is recessive). —**dominant** *n.*

**domperidone** *n.* an antiemetic **\*prokinetic** drug used especially to reduce the nausea and vomiting caused by other drugs (e.g. anticancer drugs). It inhibits the effects of **\*dopamine**, acting to close the sphincter muscle at the upper opening of the stomach (the cardia) and to relax the sphincter at the lower

opening (the pylorus). Possible side-effects include breast enlargement and pain.

**donepezil** *n.* *see* ACETYLCHOLINESTERASE INHIBITOR.

**donor** *n.* a person who makes his own tissues or organs available for use by someone else. For example, a donor may provide blood for transfusion (*see* BLOOD DONOR), a kidney for transplantation, or sex cells for \*artificial insemination or \*oocyte donation.

**donor insemination** *see* ARTIFICIAL INSEMINATION.

**Do Not Attempt Resuscitation order** *see* DNAR ORDER.

**door to balloon time** the time in minutes between a patient with S-T elevation \*myocardial infarction reaching the hospital door and inflation of a balloon or other interventional device in the occluded coronary artery. It is a key indicator of the timeliness of an emergency \*percutaneous coronary intervention service.

**dopa** *n.* dihydroxyphenylalanine: a physiologically important compound that forms an intermediate stage in the synthesis of catecholamines (dopamine, adrenaline, and noradrenaline) from the essential amino acid tyrosine. It also plays a role itself in the functioning of certain parts of the brain. The laevorotatory form, \*levodopa, is administered for the treatment of \*parkinsonism, in which there is a deficiency of the neurotransmitter \*dopamine in the brain.

**dopamine** *n.* a \*catecholamine derived from dopa that functions as a \*neurotransmitter, acting on specific dopamine receptors and also on adrenoceptors throughout the body, especially in the \*limbic system and \*extrapyramidal system of the brain as well as the arteries and the heart. It also stimulates the release of noradrenaline from nerve endings. The effects vary with location and concentration. Dopamine is used in carefully controlled dosage to increase the strength of contraction of the heart in heart failure, shock, severe trauma, and septicaemia. Possible side-effects include unduly rapid or irregular heartbeat, nausea, vomiting, breathlessness, angina pectoris, and kidney damage.

Certain drugs (**dopamine receptor agonists**) have an effect on the body similar to that of dopamine. They include *\*apomorphine*, *\*pergolide*, *\*ropinirole*, *\*cabergoline*, and **pramipexole** and are used to treat *\*parkinsonism*. Drugs that compete with dopamine to occupy and block the dopamine receptor sites in the body are known as **dopamine receptor antagonists**. They include some *\*antipsychotic* drugs (e.g. the phenothiazines and *\*butyrophenones*) and certain drugs (e.g. *\*domperidone* and *\*metoclopramide*) used to treat nausea and vomiting.

**dopamine hypothesis** the theory that *\*schizophrenia* is caused in part by abnormalities in the metabolism of *\*dopamine* and can be treated in part by drugs that antagonize its action as a neurotransmitter.

**Doppler ultrasound** a diagnostic technique that utilizes the fact that the frequency of sound or light waves changes when they are reflected from a moving surface (the **Doppler effect**). It is used to study the flow in blood vessels and the movement of blood in the heart. The frequency detector may be part of an ultrasound imaging probe, which displays an image of the anatomy on a monitor. Simultaneously the Doppler signal from a particular point on the ultrasound image can be displayed superimposed on the anatomical position (**duplex imaging**). Using electronic techniques, direction and velocity of blood flow can each be allocated different colours and displayed on a colour monitor over the anatomical image (**colour flow ultrasound imaging**). **Power Doppler**, a modification of this technique, is more sensitive at detecting flow but does not give information on direction of flow. Doppler ultrasound is a valuable technique to detect vessel thrombosis, such as deep vein thrombosis, and can be safely used in pregnancy without the risk of ionizing radiation. It is extensively used in vascular surgery to assess the status of the blood vessels before surgery, especially in carotid surgery. Doppler measurement of the fetal middle cerebral vessels (**MCA Doppler**) can predict fetal anaemia as the resistance in these vessels is increased. This noninvasive technique has supplanted serial amniocentesis/fetal cord blood sampling in cases of *\*haemolytic disease of the newborn*. Doppler of other fetal vessels (e.g. the ductus venosus) is used as a screening method for fetal chromosomal and cardiac defects and, later, fetal growth restriction. [C. J. Doppler (1803–53), Austrian physicist]

**dornase alfa** *n. see* **DNase**.

**dors-** (**dorsi-**, **orso-**) *combining form denoting* **1.** the back. Example: **dorsalgia** (pain in). **2.** dorsal.

**dorsal** *adj.* relating to or situated at or close to the back of the body or to the posterior part of an organ.

**dorsiflexion** *n.* backward flexion of the foot or hand or their digits; i.e. bending towards the upper surface.

**dorsoventral** *adj.* (in anatomy) extending from the back (dorsal) surface to the front (ventral) surface.

**dorsum** *n.* **1.** the back. **2.** the upper or posterior surface of a part of the body; for example, of the hand. *See also* **DORSAL**.

**dorzolamide** *n.* a **\*carbonic anhydrase inhibitor** used to reduce intraocular pressure in the treatment of **\*glaucoma**: it decreases the production of aqueous humour. Administered as eye drops (sometimes in combination with timolol) it may cause local burning or stinging, blurred vision, increased production of tears, dizziness, and pins and needles.

**dose** *n.* a carefully measured quantity of a drug that is prescribed by a doctor to be given to a patient at any one time. The **median effective dose (ED<sub>50</sub>)** is the dose of a drug that produces desired effects in 50% of individuals tested. *See also* **LD<sub>50</sub>**.

**dosimeter** *n.* **1.** a device used to measure the intensity of a radiation source. **2.** a device to record the amount of radiation received by workers exposed to X-rays or other radiation. *See* **THERMOLUMINESCENT DOSIMETER**.

**dosimetry** *n.* **1.** the calculation of appropriate radiation doses for treating given conditions, usually cancer in different parts of the body. *See* **RADIOTHERAPY**. **2.** the measurement of the dose received by a patient having a diagnostic technique involving ionizing radiation or by a radiation worker in his or her employment.

**DOT** directly observed therapy: *see* **TUBERCULOSIS**.

**double-blind trial** *see* **INTERVENTION STUDY**.

**double contrast** a technique usually used in X-ray examinations of the bowel. Barium sulphate **\*contrast medium** (first contrast) is used to coat the bowel wall. The bowel is then distended with gas (second contrast). The X-ray images obtained give exquisite detail of the lining of the gut. *See also* **BARIUM ENEMA**; **BARIUM SWALLOW AND MEAL**.

**double delusion** the situation in which a patient (the **inducer**) presents with delusional symptoms that he or she believes to be shared by someone else who is incapable of expressing them (typically a child or a pet). This is different from a **\*delusion** by proxy, in which the inducer does not claim to be experiencing the symptoms himself or herself. The term was introduced in 2015 by Peter Lepping, Mark Rishniw, and Roland Wolfgang Freudenmann. *Compare* **FOLIE À DEUX**.

**double J stents** *see* **STENT**.

**double-outlet right ventricle (DORV)** a congenital defect of the heart in which both the aorta and the pulmonary artery arise predominantly from the right ventricle anterior to the ventricular septum with an associated **\*ventricular septal defect** (VSD). The relationship between the site of the VSD and the great arteries must be taken into account for surgical repair. DORV can be associated with chromosomal defects.

**double uterus** *see* **UTERUS DIDELPHYS**.

**double vision** *see* **DIPLOPIA**.

**douche** *n.* a stream of water used for cleaning any part of the body, most commonly the vagina. However, vaginal douching makes a woman more susceptible to infection; moreover, it is extremely unreliable as a method of contraception.

**dowager's hump** curvature of the spine in the cervical (neck) and upper thoracic region (kyphosis), caused by compression fractures from osteoporosis. These fractures may be asymptomatic but when symptomatic cause significant pain. Long-term lung function may be compromised by the abnormal curvature of the spine. *Compare* **BUFFALO HUMP**.

**Down's syndrome (Down syndrome)** a condition resulting from a chromosomal abnormality most commonly due to the presence of three

copies of chromosome 21 (**trisomy 21**), which is most likely to occur with advanced maternal age. Down's syndrome can also occur as a result of chromosomal rearrangement (**\*translocation**) and as part of a **\*mosaicism**, which are not related to maternal age. Affected individuals share certain clinical features, including a characteristic flat facial appearance with slanting eyes (as in Mongolian races, which gave the former name, **mongolism**, to the condition), broad hands with short fingers and a single crease across the palm, malformed ears, eyes with a speckled iris (**Brushfield spots**), short stature, and **\*hypotonia**. Many individuals also have learning disabilities, although the range of ability is wide and some individuals are of normal intelligence. The incidence of congenital heart defects is 40–50%, and other structural malformations (e.g. **\*duodenal atresia**) and associated abnormalities (e.g. deafness, squints, obesity, type 2 diabetes) may also be present.

**\*Prenatal diagnosis** of Down's syndrome can be obtained by **\*amniocentesis** and **\*chorionic villus sampling**, which are invasive procedures, and about 33% of structural abnormalities in fetuses with Down's can be detected prenatally by **\*ultrasonography**. **\*Prenatal screening** tests (e.g. the **\*triple test**) and soft **\*ultrasound markers** (e.g. **\*nuchal translucency scanning**) can estimate the risk of Down's syndrome being present. [J. L. H. Down (1828–96), British physician]

<https://www.downs-syndrome.org.uk/>

- Website of the Down's Syndrome Association

**doxapram** *n.* an **\*analeptic** drug used to raise the level of consciousness in patients recovering from surgery and to treat respiratory failure. Possible side-effects include nausea, rapid heartbeat, dizziness, restlessness, and tremor.

**doxazosin** *n.* an **\*alpha blocker** used to treat high blood pressure and to relieve urinary retention due to benign enlargement of the **\*prostate gland**. Possible side-effects include faintness on standing up, weakness, dizziness, and headache.

**doxepin** *n.* a tricyclic **\*antidepressant** administered by mouth to relieve depression, especially when associated with anxiety; side-effects can include

drowsiness, dry mouth, blurred vision, and digestive upsets. It is also applied topically as a cream to relieve itching associated with eczema.

**doxorubicin** *n.* an **\*anthracycline** antibiotic isolated from *Streptomyces peucetius caesius* and used mainly in the treatment of acute leukaemias, Hodgkin's disease, non-Hodgkin's lymphoma, and various other forms of cancer. Doxorubicin acts by interfering with the production of DNA and RNA (*see also* **CYTOTOXIC DRUG**; **TOPOISOMERASE INHIBITOR**). Side-effects are those of other cytotoxic drugs; in addition, cardiotoxicity increases with cumulative dose of the drug. Use of alternative anthracyclines (e.g. epirubicin) or a liposomal preparation can reduce toxicity.

**doxycycline** *n.* a **\*tetracycline** antibiotic used to treat infections caused by *Chlamydia*, rickettsiae, mycoplasmas, and *Brucella* as well as Lyme disease. It may also be used in the prevention and treatment of malaria and the treatment of mouth ulcers and periodontitis. Side-effects are those of the other tetracyclines.

**DPP-IV inhibitors** a group of **\*oral hypoglycaemic drugs** used in the treatment of type 2 diabetes mellitus. Through inhibiting the enzyme dipeptidyl peptidase-IV they enhance the action of **\*glucagon-like peptide-1**. Five drugs in this group are currently licensed for use in the UK: **sitagliptin**, **vildagliptin**, **saxagliptin**, **linagliptin**, and **alogliptin**.

**DPT** *see* **DENTAL PANTOMOGRAM**.

**DPT vaccine** a combined vaccine against diphtheria, whooping cough (pertussis), and tetanus, the original triple vaccine used in the UK childhood immunization schedule. With the addition of inactivated polio vaccine, *Haemophilus influenzae* type b, and Hepatitis B, it is now the hexavalent vaccine **\*DTaP/IPV/Hib/HepB** and **\*DTaP/IPV** vaccines. *See* **IMMUNIZATION**.

**DR** *see* **DIGITAL RADIOGRAPHY**.

**drachm** *n.* **1.** a unit of weight used in pharmacy. 1 drachm = 3.883 g (60 grains). **2.** a unit of volume used in pharmacy. 1 fluid drachm = 3.696 ml (1/8 fluid ounce).

**dracontiasis** *n.* a tropical disease caused by the parasitic nematode *Dracunculus medinensis* (see [GUINEA WORM](#)) in the tissues beneath the skin. The disease is transmitted to humans via contaminated drinking water. The initial symptoms, which appear a year after infection, result from the migration of the worm to the skin surface and include itching, giddiness, difficulty in breathing, vomiting, and diarrhoea. Later a large blister forms on the skin, usually on the legs or arms, which eventually bursts and may ulcerate and become infected. Dracontiasis is common in India and West Africa but also occurs in Arabia, Iran, East Africa, and Afghanistan. Treatment involves extracting the worm or administering anthelmintics.

**Dracunculus** *n.* see [GUINEA WORM](#).

**dragee** *n.* a [\\*pill](#) that has been coated with sugar.

**drain 1.** *n.* a device, usually a tube or wick, used to draw fluid from an internal body cavity to the surface. A drain is sometimes inserted during an operation to ensure that any fluid formed immediately passes to the surface, so preventing an accumulation that may become infected or cause pressure in the operation site. Negative pressure (suction) can be applied through a tube drain to increase its effectiveness. Chest drains can be used in the treatment of chest trauma to drain blood (haemothorax) or air (pneumothorax) that accumulates in the pleural space. **2.** *vb.* see [DRAINAGE](#).

**drainage** *n.* the drawing off of fluid from a cavity in the body, usually fluid that has accumulated abnormally. For example, serous fluid may be drained from a swollen joint, pus removed from an internal abscess, or urine from an overdistended bladder. *See also* [DRAIN](#).

**drastic** *n.* any agent causing a major change in a body system or function, e.g. strong laxatives.

**draw-sheet** *n.* a sheet placed beneath a patient in bed that, when one portion has been soiled or becomes uncomfortably wrinkled, may be pulled under the patient so that another portion may be used. The bed does not have to be remade, and the patient does not have to leave bed.

**drepanocyte (sickle cell)** *n.* see [SICKLE-CELL DISEASE](#).

**drepanocytosis** *n.* see [SICKLE-CELL DISEASE](#).

**DRESS** *drug reaction with eosinophilia and systemic symptoms*: a potentially fatal reaction to medications, also called **anticonvulsant** and **drug-induced hypersensitivity syndrome**. It is characterized by a nonspecific skin rash and variable other symptoms, such as fever, lymphadenopathy, full blood count abnormalities, organ (e.g. liver) dysfunction, and malaise. Common drug culprits include anticonvulsants and antibiotics, although many others have been reported to cause it. Prompt withdrawal of the suspected drug is critical for recovery, but sometimes the reaction can be prolonged, even after drug withdrawal.

**dressing** *n.* material applied to a wound or diseased part of the body, with or without medication, to give protection and assist healing.

**drill** *n.* (in dentistry) a rotary instrument used to remove tooth substance, particularly in the treatment of caries. It consists of a **\*dental handpiece** that takes variously shaped **\*burs**. Most drilling is done with an air-driven turbine handpiece, but some is performed with a much slower mechanically driven handpiece. Handpieces usually have a waterspray coolant and may have a fibre-optic light.

**drip (intravenous drip)** *n.* apparatus for the continuous infusion (**\*transfusion**) of blood, plasma, saline, glucose solution, or other fluid into a vein. The fluid flows under gravity from a suspended bottle through a **\*cannula** inserted into the patient's vein. The rate of flow can be adjusted according to the rate of drips seen in a transparent section of the tube, but many **\*infusions** are now controlled by electronically regulated infusion pumps.

**drom- (dromo-)** *combining form denoting movement or speed.*

**dropsy** *n.* *see* **OEDEMA**.

**Drosophila** *n.* a genus of very small flies, commonly called fruit flies, that breed in decaying fruit and vegetables. *D. melanogaster* has been extensively used in genetic research as it has only four pairs of chromosomes and those in its salivary glands are easily recognizable. Adult *D. repleta* sometimes feed on faecal matter and may transmit disease organisms.

**drug** *n.* any substance that affects the structure or functioning of a living organism. Drugs are widely used for the prevention, diagnosis, and treatment

of disease and for the relief of symptoms. The term 'medicine' is sometimes preferred for therapeutic drugs in order to distinguish them from drugs of abuse.

**drug dependence** *see* [DEPENDENCE](#).

**drug-eluting stent** *see* [STENT](#).

**drug intolerance** lowered threshold or heightened sensitivity to the normal pharmacological action and dosage of a drug. It is unpredictable but there is some evidence of familial history.

**drusen** *pl. n.* **1. (macular drusen)** white or yellow deposits of [\\*hyalin](#) in [\\*Bruch's membrane](#) of the choroid. They may be associated with [\\*macular degeneration](#). **2. (disc drusen)** glistening nodules seen on an irregularly raised [\\*optic disc](#). Consisting of excess [\\*glia](#) (produced congenitally) that has undergone degeneration and calcification, they can be confused with [\\*papilloedema](#).

**DRVs** *see* [DIETARY REFERENCE VALUES](#).

**dry mouth** a condition that occurs as a result of reduced salivary flow from a variety of causes, including therapeutic agents, [\\*Sjögren's syndrome](#), connective-tissue diseases, diabetes, excision or absence of a major salivary gland, or radiotherapy to the head and neck that destroys the salivary glands. It causes swallowing and speech difficulties, inflamed gums, an increased incidence of dental caries, and loss of denture stability in people who have lost their teeth. Patients with their own teeth should be given strict dietary advice, chlorhexidine or fluoride mouthwashes, and sugar-free nonacidic saliva substitutes; they require special monitoring by their dentist. Medical name: **xerostomia**.

**dry socket (alveolar osteitis)** a painful dental condition in which the normal healing of a tooth socket has been disturbed. Instead of being filled with a blood clot the socket is empty as a result of a nonspecific event; treatment consists of flushing out the socket, placement of medicated dressings, pain relief, and self-care. The condition normally resolves within 14 days.

**DSDs** disorders (or differences) of sexual development. *See* [INTERSEX](#).

**DSEK** Descemet's stripping endothelial *\*keratoplasty*.

**DSI** *see* **DIGITAL SPOT IMAGING**.

**DSM** Diagnostic and Statistical Manual of Mental Disorders: an influential publication of the American Psychiatric Association in which psychiatric disorders are classified and defined. The current (2013) version is DSM-5, which superseded DSM-IV-TR (2000), a text revision (TR) of the DSM-IV. DSM-5 has attracted much controversy and criticism, notably that it tends to medicalize behaviour patterns that many would consider to be normal.

**DSTs** *see* **DEXAMETHASONE SUPPRESSION TESTS**.

**DTaP/IPV (dTaP/IPV)** a booster vaccine given to children between 3 years 4 months and 5 years of age. It tops up protection against diphtheria, tetanus, pertussis (whooping cough), and polio.

**DTaP/IPV/Hib/HepB** a primary *\*immunization* given to infants typically at 2, 3, and 4 months of age. It protects against six diseases: diphtheria (D), tetanus (T), pertussis (whooping cough) acellular component (aP), polio (inactivated polio vaccine) IPV, *Haemophilus influenzae* type b infection (Hib) (*see* **HIB VACCINE**), and Hepatitis B (HepB).

**DTPA** diethylenetriaminepentaacetic acid, which when labelled with *\*technetium-99m* is used as a tracer to obtain *\*scintigrams* of the kidney over a period of time, by means of a *\*gamma camera*. DTPA is filtered out of the blood by the kidneys and passes into the urine; it is used to show the function of the kidney and reflux from the bladder up the ureter. It is particularly useful in assessing obstruction to urinary drainage from the kidneys.

**dual antiplatelet therapy (DAPT)** aspirin prescribed at the same time as another oral *\*antiplatelet drug* (e.g. clopidogrel, prasugrel, ticagrelor) for patients deemed to be at temporarily increased risk of coronary or stent thrombosis (typically following *\*acute* coronary syndrome or new coronary stent implantation). After a prespecified time (usually 12 months), the aspirin is continued and the other antiplatelet drug is stopped.

**dual diagnosis** the coexistence of a severe mental disorder with a *\*substance misuse* disorder.

**Duane's syndrome** an abnormality of the eye muscles leading most commonly to restricted abduction (outward movement of the eye away from the midline) of one eye. On attempted adduction (inward movement of the eye towards the midline) of that same eye there is retraction of the eye into the orbit and narrowing of the opening between the eyelids. [A. Duane (1858–1926), US ophthalmologist]

**Duchenne muscular dystrophy** *see* **MUSCULAR DYSTROPHY**. [G. B. A. Duchenne (1806–75), French neurologist]

**duct** *n.* a tubelike structure or channel, especially one for carrying glandular secretions.

**ductal carcinoma in situ (DCIS)** the earliest stage of breast cancer, detectable by mammography, which is confined to the lactiferous (milk) ducts of the breast. *See* **CARCINOMA IN SITU**.

**ductions** *pl. n.* movements of one eye, i.e. adduction (rotation towards the nose), abduction (rotation towards the temple), elevation, depression, intorsion, and extorsion.

**ductless gland** *see* **ENDOCRINE GLAND**.

**ductule** *n.* a small duct or channel.

**ductus** *n.* a duct. The **ductus deferens** is the *\*vas deferens*.

**ductus arteriosus** a blood vessel in the fetus connecting the pulmonary artery directly to the ascending aorta, so bypassing the pulmonary circulation. It normally closes after birth. Failure of the ductus to close (**patent ductus arteriosus**) produces a continuous *\*murmur*, and the consequences are similar to those of a *\*septal defect*. It may close spontaneously in childhood but often requires surgical closure.

**ductus venosus** a blood vessel in the fetus that conveys oxygenated blood from the umbilical vein to the inferior vena cava and right atrium, where it passes through the *\*foramen* ovale to the left atrium and left ventricle.

**Dukes' staging** a widely accepted histological classification of the extent of tumours of the colon and rectum, which is useful for prognosis. There have

been modifications to the original classification. [Sir C. Dukes (1890–1977), British pathologist]

**duloxetine** *n. see* [SNRI](#).

**dumbness** *n. see* [MUTISM](#).

**Dumdum fever** *see* [KALA-AZAR](#).

**dumping syndrome** a syndrome that may occur following operations on the stomach, particularly [\\*gastrectomy](#) (**postgastrectomy syndrome**), due to the precipitous transit of ingested food into the small intestine. In early dumping, debilitating symptoms start within 30 minutes of the meal; they include abdominal cramps, flushing, sweating, diarrhoea, and palpitations. Late dumping syndrome occurs 1–2 hours after a meal and relates to hypoglycaemia. The patient may feel faint, weak, and nauseous, has a rapid pulse, and may sweat and become pale. Avoidance of large carbohydrate meals and having small but frequent meals (six a day) may relieve the symptoms but further surgery is sometimes required.

**Duncan disease** *see* [X-LINKED LYMPHOPROLIFERATIVE SYNDROME](#). [Duncan family, in whom the disease was first studied]

**duo-** *combining form denoting two.*

**duoden-** (**duodeno-**) *combining form denoting the duodenum. Example: duodenectomy* (excision of).

**duodenal atresia** a condition in which there is congenital narrowing of the duodenum causing complete obstruction. It presents at birth with vomiting, which is usually bile-stained, and is associated with other congenital abnormalities, particularly [\\*Down's syndrome](#). Treatment is by restoration of any fluid and electrolyte loss followed by surgical repair.

**duodenal ulcer** an ulcer in the duodenum, caused by the action of acid and pepsin on the duodenal lining (mucosa) of a susceptible individual. It is usually associated with an increased output of stomach acid. Infection of the [\\*antrum](#) of the stomach with [\\*Helicobacter pylori](#) is almost always present. Other causes include ingestion of aspirin or other [\\*NSAIDs](#). Symptoms include chronic episodic pain in the upper abdomen, especially when the stomach is empty; vomiting occurs infrequently. Complications include

bleeding (see [HAEMATEMESIS](#)), [\\*perforation](#), and obstruction due to scarring (see [PYLORIC STENOSIS](#)). Bleeding ulcers may be amenable to endoscopic therapy. Symptoms are relieved by antacid medicines; most ulcers heal if treated by an [\\*antisecretory drug](#). *H. pylori* infection requires a combination of a [\\*proton-pump inhibitor](#) (or an H<sub>2</sub>-receptor antagonist) and two different antibiotics over a 7-day period. Surgery (see [GASTRECTOMY](#); [VAGOTOMY](#)) is now rarely required.

**duodenitis** *n.* inflammation of the duodenum. Duodenitis is commonly caused by infection with [\\*Helicobacter pylori](#), NSAIDs, smoking, and alcohol. Clinical symptoms are nonspecific (vague abdominal discomfort may be present), or the findings of duodenal inflammation may be noted at gastroscopy in an asymptomatic patient. Treatment may include antibiotics for *H. pylori* infection, antisecretory agents, and the withdrawal of implicated drugs (such as diclofenac).

**duodenoscope** *n.* a fiberoptic or video instrument for examining the interior of the duodenum. A side-viewing duodenoscope allows direct visualization of the duodenal ampulla and is used in performing [\\*ERCP](#).

**duodenostomy** *n.* an operation, now rarely performed, in which the duodenum is brought through the abdominal wall and opened, usually in order to introduce food. *See also* [GASTRODUODENOSTOMY](#).

**duodenum** *n.* the first of the three parts of the small [\\*intestine](#). It extends from the pylorus of the stomach to the jejunum. The duodenum receives bile from the gall bladder (via the common bile duct) and pancreatic juice from the pancreas. Its wall contains various glands (including [\\*Brunner's glands](#)) that secrete an alkaline juice, rich in mucus, that protects the duodenum from the effects of the acidic [\\*chyme](#) passing from the stomach. —**duodenal** *adj.*

**duplex imaging** *see* [DOPPLER ULTRASOUND](#).

**Dupuytren's contracture** a flexion deformity of the fingers (usually the ring and little fingers) caused by a nodular [\\*hypertrophy](#) and [\\*contracture](#) of the [\\*fascia](#) in the palm. The characteristic sign is a nodule at the distal palmar crease or over the proximal phalanx of the finger. The condition is treated by surgical excision of the contracted and thickened tissue. Dupuytren's contracture may be associated with excessive alcohol consumption, diabetes

mellitus, repetitive hand use, or vibratory trauma. [Baron G. Dupuytren (1777–1835), French surgeon]

**dura (dura mater, pachymeninx)** *n.* the thickest and outermost of the three **\*meninges** surrounding the brain and spinal cord. It consists of two closely adherent layers, the outer of which is identical with the periosteum of the skull. The inner dura extends downwards between the cerebral hemispheres to form the **falx cerebri** and forwards between the cerebrum and cerebellum to form the **tentorium**. A thin film of fluid (not cerebrospinal fluid) separates the inner dura from the arachnoid.

**dural** *adj.* of, relating to, or affecting the **\*dura**.

**dutasteride** *n.* a drug used in the treatment of benign prostatic hyperplasia (see **PROSTATE GLAND**). It is a 5 $\alpha$ -reductase inhibitor, which blocks the conversion of testosterone to dihydrotestosterone. It has the same side-effects as **\*finasteride**.

**duty** *n.* what is owed to another person, creating an obligation or moral requirement to behave in one way rather than another. Duty may arise from rules or principles, such as the **\*four principles** of medical ethics, or from particular relationships (e.g. doctor and patient or parent and child). Dilemmas may arise where these duties appear to conflict or are unclearly delineated. The idea of duty as an absolute **\*imperative** that does not vary with circumstances is central to the tradition of **\*Kantian ethics** (see **DEONTOLOGY**). Doctors also have legal duties towards their patients because of their **\*fiduciary relationship** and assume a **duty of care** as soon as they start a consultation. If doctors, registered nurses, or other health professionals fall short of their legal duty of care, they may be subject to a claim of **\*negligence**.

**DVD** see **DISSOCIATED VERTICAL DEVIATION**.

**DVT (deep vein thrombosis)** see **PHLEBOTHROMBOSIS**.

**dwarfism** *n.* abnormally short stature from any cause. The most common type is **achondroplastic dwarfism** (see **ACHONDROPLASIA**). **Pituitary dwarfism** results from a deficiency of **\*growth hormone** due to a defect in the pituitary gland; people with this type of dwarfism are well proportioned. **Primordial**

**dwarfism** is due to a genetic defect in the response to growth hormone. Dwarfism may also be associated with thyroid deficiency (see **CRETINISM**), in which both physical and mental development are arrested; chronic diseases such as rickets; renal failure; and intestinal malabsorption.

**dydrogesterone** *n.* a synthetic female sex hormone (see **PROGESTOGEN**) used (in conjunction with estradiol) in hormone replacement therapy. It may cause mild nausea and breakthrough bleeding.

**dying** *n.* the end stage of every person's life, lasting often for several days before the actual \***death**. Having a duty to save life, clinicians may fail to notice the moment when death becomes inevitable and they must now provide the care appropriate for a dying patient. This point is recognized by a change in demeanour, social involvement, and even vital signs, and in some cases the patient may tell (or try to tell) others, including professional carers, that this is happening. In the best care, after the physician recognizes the patient's state, treatments that may be burdensome are stopped and replaced by those that may benefit someone dying: symptom relief is the key factor. *See also* **HOSPICE**; **PALLIATIVE**.

**dynamic splintage** a technique that retains the essentials of splinting but allows some controlled movement of the restrained body part.

**dynamometer** *n.* a device for recording the force of a muscular contraction. A small hand-held dynamometer may be used to record the strength of a patient's grip. A special optical dynamometer measures the action of the muscles controlling the shape of the lens of the eye.

**dyne** *n.* a unit of force equal to the force required to impart to a mass of 1 gram an acceleration of 1 centimetre per second per second.  $1 \text{ dyne} = 10^{-5} \text{ newton}$ .

**-dynia** *combining form denoting pain.* Example: **proctodynia** (in the rectum).

**dys-** *prefix denoting difficult, abnormal, or impaired.* Examples: **dysbasia** (difficulty in walking); **dysgeusia** (impairment of taste).

**dysaesthesia** *n.* the abnormal and sometimes unpleasant sensation felt by a patient with partial damage to sensory nerve fibres when the skin is

stimulated. *Compare* [PARAESTHESIA](#).

**dysarthria** *n.* a speech disorder in which the pronunciation is unclear although the language content and meaning are normal.

**dysbarism** *n.* any clinical syndrome due to a difference between the atmospheric pressure outside the body and the pressure of air or gas within a body cavity (such as the paranasal sinuses or the middle ear). *See* [COMPRESSED AIR ILLNESS](#).

**dyscalculia** *n.* a developmental disorder in which a child's ability to learn arithmetical facts and to process and manipulate numbers is significantly below normal for his or her age. Like *\*dyslexia*, with which it is associated, it is not caused by intellectual impairment.

**dyschezia** *n.* a form of constipation resulting from a long period of voluntary suppression of the urge to defecate. The rectum becomes distended with faeces and bowel movements are difficult or painful.

**dyschondroplasia (Ollier's disease)** *n.* a condition due to faulty ossification of cartilage, resulting in development of many benign cartilaginous tumours (*see* [CHONDROMA](#)). The bones involved may become stunted and deformed. There is an increased risk of developing malignant tumours (*see* [CHONDROSARCOMA](#)).

**dyschromatopsia** *n.* any defect of colour vision.

**dyscoria** *n.* any abnormality in the shape of the pupil.

**dyscrasia** *n.* an abnormal state of the body or part of the body, especially one due to abnormal development or metabolism. In classical medicine the term was used for the imbalance of the four humours (blood, phlegm, yellow bile, black bile), which was believed to be the basic cause of all diseases.

**dysdiadochokinesis (adiadochokinesis)** *n.* clumsiness in performing rapidly alternating movements. It is often recognized by asking the patient to tap alternately between the front and back of one hand and the back of the other hand. Impairment of this task is indicative of disease of the cerebellum or its intracerebral connections.

**dysentery** *n.* an infection of the intestinal tract that causes severe diarrhoea with blood and mucus. **Amoebic dysentery (amoebiasis)** is caused by the protozoan *Entamoeba histolytica* and results in intestinal ulceration (**amoebic colitis**) and occasionally abscesses in the liver (**amoebic** or **tropical abscesses**), lungs, testes, or brain. The parasite is spread by food or water contaminated by infected faeces. Symptoms appear days or even years after infection and include diarrhoea, indigestion, loss of weight, and anaemia. Prolonged treatment with drugs, including metronidazole, is usually effective in treating the condition. Amoebic dysentery is mainly confined to tropical and subtropical countries.

**Bacillary dysentery** is caused by bacteria of the genus *Shigella* and is spread by contact with a patient or carrier or through contaminated food or water. Epidemics are common in overcrowded, insanitary conditions. Symptoms develop 1–6 days after infection and persist for up to 2 weeks; they include diarrhoea, nausea, abdominal cramping, and fever. An attack may vary from mild diarrhoea to states of severe dehydration and gastrointestinal haemorrhage. In most cases, provided fluid losses are replaced, recovery occurs within 7–10 days; antibiotics may be given to eliminate the bacteria. *Compare* **CHOLERA**.

**dysfunctional uterine bleeding** *see* **MENORRHAGIA**.

**dysgenesis** *n.* faulty development. **Gonadal dysgenesis** is failure of the ovaries or testes to develop (*see* **TURNER'S SYNDROME**).

**dysgerminoma (germinoma, gonocytoma)** *n.* a malignant tumour of the ovary, thought to arise from primitive germ cells; it is homologous to the **\*seminoma** of the testis. About 15% of such tumours affect both ovaries; outside the ovary they have been recorded in the anterior mediastinum and in the pineal gland. Dysgerminomas may occur from infancy to old age, but the average age of patients is about 20 years. Treatment is by oophorectomy, with chemotherapy for residual disease.

**dysgraphia** *n.* *see* **AGRAPHIA**.

**dys hormonogenesis** *n.* a collection of inherited disorders of thyroid hormone synthesis resulting in low levels of **\*thyroxine** and **\*triiodothyronine** and high levels of **\*thyroid-stimulating hormone**, with consequent **\*goitre**

formation. The result may be [\\*cretinism](#) with a goitre or milder forms of [\\*hypothyroidism](#) with a goitre. Several different stages of the production pathway for thyroid hormones can be affected.

**dyskaryosis** *n.* the abnormal condition of a cell that has a nucleus showing the features characteristic of the earliest stage of malignancy, while retaining relatively normal cytoplasm. It may be seen, for example, in the squamous and columnar epithelial cells of a cervical smear (see [CERVICAL SCREENING](#)).

**dyskinesia** *n.* a group of involuntary movements that appear to be a fragmentation of the normal smoothly controlled limb and facial movements. They include [\\*chorea](#), [\\*dystonia](#), [\\*athetosis](#), and those involuntary movements occurring as side-effects to the use of levodopa and the phenothiazines (see [TARDIVE DYSKINESIA](#)).

**dyslexia** *n.* a developmental disorder selectively affecting a child's ability to learn to read and write. The condition affects boys more often than girls and can create serious educational problems. It is sometimes called **specific dyslexia**, **developmental reading disorder**, or **developmental word blindness** to distinguish it from acquired difficulties with reading and writing. Compare [ALEXIA](#). —**dyslexic** *adj.*

**dysmenorrhoea** *n.* menstruation that is associated with cramping low abdominal pain radiating into the lower back and thighs; the pain sometimes precedes menstrual flow. In **primary dysmenorrhoea** the painful periods begin soon after [\\*menarche](#) and are associated with increased production of [\\*prostaglandin](#) F<sub>2α</sub> by the endometrium. **Secondary dysmenorrhoea** is caused by organic pelvic disease, such as fibroids or endometriosis.

**dysmetria** *n.* impaired coordination due to disorders of the cerebellum or its connections within the brainstem. In the [\\*finger–nose test](#), the patient's finger over- or undershoots or passes the target because of failure to control the movement accurately.

**dysmnestic syndrome** a disorder of memory in which new information is not learned but old material is well remembered. See [KORSAKOFF'S SYNDROME](#).

**dysmorphic** *adj.* describing a body characteristic that is abnormally formed. A dysmorphic feature can be a minor isolated feature, such as **\*clinodactyly**, or it may be found in association with other features in more serious syndromes, such as **\*Down's syndrome**.

**dysmorphology** *n.* the study of **\*malformations** during embryogenesis.

**dysmorphophobia** *see* **BODY DYSMORPHIC DISORDER**.

**dysostosis** *n.* the abnormal formation of bone or the formation of bone in abnormal places, such as a replacement of cartilage by bone.

**dyspareunia** *n.* painful sexual intercourse experienced by a woman. It may be related to **\*vaginismus** or caused by underlying disease, such as endometriosis or pelvic inflammatory disease. *See* **APAREUNIA**.

**dyspepsia (indigestion)** *n.* disordered digestion: usually applied to pain or discomfort in the lower chest or upper abdomen after eating and sometimes accompanied by nausea, vomiting, or a feeling of unease or fullness after eating. —**dyspeptic** *adj.*

**dysphagia** *n.* difficulty in swallowing secondary to either mechanical obstruction or neurological disease. It can be caused by obstruction of the oropharynx or oesophagus by disease (for example, oesophageal carcinoma) or by neurological impairment of the coordination of the muscles involved in swallowing. Such disorders include motor neuron disease, multiple sclerosis, and stroke. A patient may describe food sticking at the level of the sternum in oesophageal dysphagia (*compare* **ODYNOPHAGIA**).

**dysphasia** *n.* *see* **APHASIA**.

**dysphonia** *n.* difficulty in voice production. This may be due to a disorder of the larynx, pharynx, tongue, or mouth, or it may be **\*psychogenic**. *Compare* **DYSARTHRIA**; **APHASIA**.

**dysplasia (alloplasia, heteroplasia)** *n.* a premalignant condition characterized by abnormal development of epithelium, bone, or other tissues. *See also* **BRONCHOPULMONARY DYSPLASIA**; **FIBROUS DYSPLASIA**. —**dysplastic** *adj.*

**dysplastic kidneys** any developmental abnormalities resulting from anomalous metanephric differentiation (*see* [METANEPHROS](#)). Most dysplastic kidneys are associated either with an abnormally located ureteral orifice or with urinary tract anomalies that are expected to produce unilateral, bilateral, or segmental urinary obstruction.

**dyspnoea** *n.* laboured or difficult breathing. (The term is often used for a sign of laboured breathing apparent to the doctor, **breathlessness** being used for the subjective feeling of laboured breathing.) Dyspnoea can be due to obstruction to the flow of air into and out of the lungs (as in bronchitis and asthma), various diseases affecting the tissue of the lung (including pneumoconiosis, emphysema, tuberculosis, and cancer), and heart disease.

**dyspraxia** *n.* *see* [APRAXIA](#).

**dyssocial** *adj.* *see* [ANTISOCIAL PERSONALITY DISORDER](#).

**dysthymia** *n.* a permanent state of mildly lowered mood. This never reaches the severity of clinical *\*depression* but it can impair the person's quality of life. It is often associated with *\*emotionally unstable personality disorder*. Treatment options include *\*psychotherapy* and *\*SSRIs* in high doses. — **dysthymic** *adj.*

**dystocia** *n.* difficult birth, caused by abnormalities in the fetus or the mother (*see* [OBSTRUCTED LABOUR](#)). Dystocia may arise due to uterine *\*inertia*, which is more common in a first labour; abnormal fetal lie or presentation; absolute or relative *\*cephalopelvic disproportion*; or (rarely) a massive fetal tumor, such as a sacrococcygeal teratoma. Synthetic oxytocin (Syntocinon) is commonly used to treat uterine inertia. However, pregnancies complicated by dystocia often end with assisted deliveries, including forceps, ventouse, or (commonly) Caesarean section. *See also* [SHOULDER DYSTOCIA](#).

**dystonia** *n.* muscle dysfunction characterized by spasms or abnormal muscle contraction. One form is a postural disorder often associated with disease of the *\*basal ganglia* in the brain. There may be spasm in the muscles of the face (*see* [HEMIFACIAL SPASM](#)), shoulders, neck, trunk, and limbs; the arm is often held in a rotated position and the head may be drawn back and to one side. Other forms of dystonia include *\*torticollis*, *\*blepharospasm*, and writer's

**\*cramp**. Dystonic conditions, including blepharospasm, may be helped by the injection of **\*botulinum toxin**. —**dystonic** *adj.*

**dystrophia myotonica (myotonic dystrophy)** a type of **\*muscular dystrophy** in which the muscle weakness and wasting is accompanied by an unnatural prolongation of the muscular contraction after any voluntary effort (*see* **MYOTONIA**). The muscles of the face, temples, and neck are especially wasted. Baldness, endocrine malfunction, and cataracts also occur. The disease can affect both sexes (it is inherited as an autosomal **\*dominant** disorder). Genetic testing for mutations in the dystrophia myotonica protein kinase gene is possible.

**dystrophic calcification** the calcification of injured or necrotic tissue in the absence of systemic **\*hypercalcaemia**. Dystrophic calcification is a characteristic feature in some cancers of the breast, ovary, and thyroid gland. *Compare* **METASTATIC CALCIFICATION**.

**dystrophy (dystrophia)** *n.* a disorder of an organ or tissue, usually muscle, due to impaired nourishment of the affected part. The term is applied to several unrelated conditions; for example, **\*muscular dystrophy**, **\*Fuchs' endothelial dystrophy**, and **dystrophia adiposogenitalis** (*see* **FRÖHLICH'S SYNDROME**).

**dysuria** *n.* difficult or painful urination. This is usually associated with urgency and frequency of urination if due to **\*cystitis** or **\*urethritis**. The pain is burning in nature and is relieved by curing the underlying cause. A high fluid intake usually helps.

**Eagle–Barrett syndrome** *see* PRUNE BELLY SYNDROME.

**Eales' disease** inflammation of the blood vessels of the retina occurring in young adults. It is characterized by leakage from abnormal growths of new vessels as well as recurrent haemorrhages into the vitreous humour. [H. Eales (1852–1913), British physician]

**ear** *n.* the sense organ concerned with hearing and balance (see illustration). Sound waves, transmitted from the outside into the external auditory meatus, cause the eardrum (tympanic membrane) to vibrate. The small bones (ossicles) of the middle ear – the malleus, incus, and stapes – transmit the sound vibrations to the fenestra ovalis, which leads to the inner ear (*see* LABYRINTH). Inside the **\*cochlea** the sound vibrations are converted into nerve impulses. Vibrations emerging from the cochlea could cause pressure to build up inside the ear, but this is released through the **\*Eustachian tube**. The **\*semicircular canals**, **\*saccul**e, and **\*utricle** – also in the inner ear – are all concerned with balance.

**Structure of the ear.**

**earache** *n.* see OTITIS; OTALGIA.

**eardrum** *n.* see TYMPANIC MEMBRANE.

**ear-lobe creases** diagonal creases across the ear lobes, which have a statistically significant correlation with coronary atheroma. The reason is unknown.

**early neonatal death** see PERINATAL MORTALITY RATE.

**early warning system (EWS)** a system to detect deteriorating patients on the ward. Certain physical parameters are accorded scores: the higher the scores for individual patients, the greater the deterioration in their condition. Parameters scored include blood pressure, respiratory rate, pulse rate, blood oxygen saturation, and level of consciousness. Adjustments can be made for increased age.

**earwax** *n.* see CERUMEN.

**Ebola virus** a virus responsible for an acute infection in humans with features similar to those of **\*Marburg disease**. Transmission is by contact with infected blood and other body fluids and the incubation period is 2–21 days (7 days on average). The mortality rate is 53–88%, but intensive treatment (including rehydration) in the early stages of the disease can halt its rapid and usually irreversible progression to haemorrhaging of internal organs. Until recently, sporadic but short-lived outbreaks have occurred in Africa since 1976, when the virus was first identified during an outbreak in the region of the Ebola river, in Zaïre (now Democratic Republic of Congo). A major epidemic of the disease broke out in West Africa at the end of 2013 and lasted until May 2016: over 11,000 people died. An unknown species of animal – possibly a fruit bat – is assumed to act as a reservoir for the virus between outbreaks of the disease in humans.

**Ebstein's anomaly** a form of congenital heart disease affecting the right side of the heart: the tricuspid valve is displaced towards the apex to a varying extent, resulting in impaired right ventricular function. It can cause breathlessness, **\*failure to thrive**, cyanosis, and abnormalities of heart rhythm, although if mild it may be asymptomatic. If mild, life expectancy is normal. If severe, corrective surgery may be necessary. [W. Ebstein (1836–1912), German physician]

**eburnation** *n.* the wearing down of the cartilage at the articulating surface of a bone, exposing the underlying bone and leading to bone sclerosis, in which the bone's surface becomes dense and smooth like ivory. This is an end result of **\*osteoarthritis**.

**EBV (EB virus)** *see* **EPSTEIN–BARR VIRUS**.

**ec-** *prefix denoting out of or outside.*

**ecbolic** *n.* an agent, such as **\*oxytocin**, that induces childbirth by stimulating contractions of the uterus.

**ecchondroma** *n.* (*pl.* **ecchondromata**) a benign cartilaginous tumour (*see* **CHONDROMA**) that protrudes beyond the margins of a bone. *Compare* **ENCHONDROMA**.

**ecchymosis** *n.* a **\*bruise**: an initially bluish-black mark on the skin, resulting from the release of blood into the tissues either through injury or through the

spontaneous leaking of blood from the vessels (as in some blood diseases).

**eccrine** *adj.* **1.** describing sweat glands that are distributed all over the body. Their ducts open directly onto the surface of the skin and they are densest on the soles of the feet and the palms of the hands. *Compare* **APOCRINE**. **2.** *see* **MEROCRINE**.

**ecdemic** *adj.* not occurring normally in the population of a country: applied sometimes to unusual diseases brought in from abroad by immigrants or travellers. *Compare* **ENDEMIC**.

**ecdysis** *n.* the act of shedding skin; **\*desquamation**.

**ECG** *n.* *see* **ELECTROCARDIOGRAM**.

**echinococcosis (echinococcosis)** *n.* *see* **HYDATID DISEASE**.

**Echinococcus** *n.* a genus of small parasitic tapeworms that reach a maximum length of only 8 mm. Adults are found in the intestines of dogs, wolves, or jackals. If the eggs are swallowed by a human, who can act as a secondary host, the resulting larvae penetrate the intestine and settle in the lungs, liver, or brain to form large cysts, usually 5–10 cm in diameter (*see* **HYDATID DISEASE**). Two species causing this condition are *E. granulosus* and *E. multilocularis*.

**echinocyte** *n.* *see* **BURR CELL**.

**echoacousia** *n.* a false sensation of echoing after normally heard sound owing to a defect of the cochlea in the inner ear.

**echocardiography** *n.* the use of **\*ultrasound** waves to investigate and display the action of the heart as it beats. Used in the diagnosis and assessment of congenital and acquired heart diseases, it is safe, painless, and reliable and reduces the need for cardiac **\*catheterization**. **M-mode echocardiography** uses a single beam of ultrasound. The image produced is not anatomical but permits precise measurement of cardiac dimensions and the diagnosis of valvular, myocardial, and pericardial disease. **2-D echocardiography** uses a pulsed array of ultrasound beams to build up a moving image on a TV monitor of the chambers and valves of the heart. In **Doppler echocardiography** ultrasound reflected from moving red blood cells is

subject to the Doppler effect (change of frequency with velocity relative to the observer), which can be used to calculate blood flow and pressure within the heart and great vessels. It is useful in the diagnosis and assessment of valve disease and intracardiac shunts. In **transoesophageal echocardiography** (TOE) the ultrasound probe is mounted on an oesophageal endoscope. The examination from within the oesophagus allows the probe to be placed directly against the back of the heart, which enables improved visualization of the posterior structures.

**echo de la pensée** *see* **THOUGHT ECHO**.

**echolalia** *n.* pathological repetition of the words spoken by another person. It may be a symptom of language disorders, **\*autism**, severe mental illness (e.g. catatonic schizophrenia), dementia, or **\*Tourette's syndrome**.

**echopraxia** pathological imitation of the actions of another person. It may be a symptom of **\*catatonia** or of **\*latah**. It is sometimes called **echokinesis**.

**echovirus** *n.* one of a group of about 30 RNA-containing viruses, originally isolated from the human intestinal tract, that were found to produce pathological changes in cells grown in culture, although they were not clearly associated with any specific disease. These viruses – which were accordingly termed *enteric cytopathic human orphan viruses* – are now more commonly known as **\*Coxsackie viruses**. *Compare* **REOVIRUS**.

**eclabium** *n.* the turning outward of a lip.

**eclampsia** *n.* the occurrence of one or more convulsions not caused by other conditions, such as epilepsy or cerebral haemorrhage, in a woman with **\*pre-eclampsia**. The onset of convulsions may be preceded by a sudden rise in blood pressure and/or a sudden increase in **\*oedema** and development of **\*oliguria**. The convulsions are usually followed by coma. Eclampsia is a threat to the life of both mother and baby and must be treated immediately.

**ECMO** *see* **EXTRACORPOREAL MEMBRANE OXYGENATION**.

**ECoG** *see* **ELECTROCOCHLEOGRAPHY**.

**ecology (bionomics)** *n.* the study of the relationships between humans, plants and animals, and the environment, including the way in which human

activities may affect other animal populations and alter natural surroundings.  
—**ecological** *adj.* —**ecologist** *n.*

**econazole** *n.* an antifungal drug used to treat ringworm and candidiasis. Possible side-effects may include local irritation and burning.

**ecraseur** *n.* a surgical device, resembling a **\*snare**, that is used to sever the base of a tumour during its surgical removal.

**ecstasy** *n.* a sense of extreme wellbeing and bliss. The word applies particularly to **\*trance** states dominated by religious thinking. While not necessarily pathological, it can be caused by epilepsy (especially of the temporal lobe) or by **\*schizophrenia** or **\*mania**.

**Ecstasy** *n.* the street name for methylenedioxymethamphetamine (MDMA), a mildly hallucinogenic drug that generates feelings of euphoria in those who take it. Its most common side-effect is hyperthermia; drinking large quantities of water to combat the intense thirst produced by taking the drug may result in fatal damage to the body's fluid balance. Its manufacture, sale, use, and possession are illegal.

**ECT** *see* **ELECTROCONVULSIVE THERAPY**.

**ect-** (**ecto-**) *combining form denoting* outer or external.

**ectasia** (**ectasis**) *n.* the dilatation of a tube, duct, or hollow organ.

**ecthyma** *n.* an infection of the skin caused by *Streptococcus pyogenes*, *Staphylococcus aureus*, and other bacteria. The full thickness of the epidermis is involved (*compare* **IMPETIGO**, which is a superficial infection). Ecthyma heals slowly and causes scarring. It may be associated with poor hygiene or depressed immunity.

**ectoderm** *n.* the outer of the three **\*germ layers** of the early embryo. It gives rise to the nervous system and sense organs, the teeth and lining of the mouth, and to the **\*epidermis** and its associated structures (hair, nails, etc.). — **ectodermal** *adj.*

**ectomorphic** *adj.* describing a **\*body type** that is relatively thin, with a large skin surface in comparison to weight. — **ectomorph** *n.* — **ectomorphy** *n.*

**-ectomy** *combining form denoting surgical removal of a segment or all of an organ or part. Examples: **appendicectomy** (of the appendix); **prostatectomy** (of the prostate gland).*

**ectoparasite** *n.* a parasite that lives on the outer surface of its host. Some ectoparasites, such as bed bugs, maintain only periodic contact with their hosts, whereas others, such as the crab louse, have a permanent association. *Compare* **ENDOPARASITE**.

**ectopia** *n.* **1.** the misplacement, due either to a congenital defect or injury, of a bodily part. **2.** the occurrence of something in an unnatural location (*see also* **ECTOPIC BEAT**; **ECTOPIC PREGNANCY**). —**ectopic** *adj.*

**ectopic beat (extrasystole)** a heartbeat due to an impulse generated somewhere in the heart outside the sinoatrial node. Ectopic beats are generally premature in timing; they are classified as **supraventricular** if they originate in the atria and **ventricular** if they arise from a focus in the ventricles. They may be produced by any heart disease, by nicotine from smoking, or by caffeine from excessive tea or coffee consumption; they are common in normal individuals. The patient may be unaware of their presence or may feel that his heart has ‘missed a beat’. Ectopic beats may be suppressed by drugs such as quinidine, propranolol, and lidocaine; avoidance of smoking and reduction in excessive tea or coffee intake may help. *See* **ARRHYTHMIA**.

**ectopic hormone** a hormone produced by cells that do not usually produce it. Some tumour cells secrete hormones; for example, small-cell lung cancer cells secrete antidiuretic hormone and cause **\*hyponatraemia**.

**ectopic pregnancy (extrauterine pregnancy)** the implantation of a fertilized egg cell at a site outside the uterus. This may happen if the fertilized egg cell remains in the ovary or in the Fallopian tube or if it lodges in the free abdominal cavity. The most common type of ectopic pregnancy is a **tubal pregnancy**, which occurs in Fallopian tubes that become blocked or inflamed. The growth of the fetus may cause the tube to rupture and bleed, causing severe haemorrhage. Early detection of the condition (e.g. by monitoring serum **\*human chorionic gonadotrophin** and **\*transvaginal ultrasonography**) allows conservative treatment in many cases; medical

treatment (with methotrexate), which preserves fertility, may also be possible. Laparoscopic surgery is the preferred surgical treatment.

**ectoplasm** *n.* the outer layer of cytoplasm in cells, which is denser than the inner cytoplasm (**\*endoplasm**) and concerned with activities such as cell movement. —**ectoplasmic** *adj.*

**ectro-** *combining form denoting* congenital absence.

**ectrodactyly** *n.* congenital absence of all or part of one or more fingers.

**ectromelia** *n.* congenital absence or gross shortening (aplasia) of the long bones of one or more limbs. *See also* **AMELIA**; **HEMIMELIA**; **PHOCOMELIA**.

**ectropion** *n.* **1.** turning out of the eyelid, away from the eyeball. The commonest type is **senile ectropion**, in which the lower eyelid droops because of laxity of the eyelid in old age. If the muscle that closes the eye (orbicularis oculi) is paralysed the lower lid also droops. Ectropion may also occur if scarring causes contraction of the surrounding facial skin. **2.** (**cervical ectopy**) the replacement of the stratified squamous epithelium that normally lines the vaginal part of the cervix (ectocervix) by columnar epithelium, which has migrated from the **\*endocervix**. As a result, the junction of squamous and columnar epithelia does not coincide with the opening of the cervix into the uterus. Cervical ectropion is caused by exposure to higher levels of oestrogen, which occurs normally at certain times (e.g. at puberty or in pregnancy) or with **\*anovulation**. It usually causes no symptoms but in a few cases may be associated with postcoital bleeding and a mucoid vaginal discharge.

**eczema** *n.* a common itchy skin disease characterized by reddening (**\*erythema**) and vesicle formation, which may lead to weeping and crusting. It is endogenous, or constitutional, i.e. outside agents do not play a primary role (*compare* **DERMATITIS**), but in some contexts the terms ‘dermatitis’ and ‘eczema’ are used interchangeably. There are five main types: (1) **atopic eczema**, which affects up to 20% of the population and is associated with asthma and hay fever; (2) **seborrhoeic eczema** (or **seborrhoeic dermatitis**), which involves the scalp, eyelids, nose, and lips, is associated with the presence of *Malassezia* yeasts and may also be seen in HIV infection; (3) **discoid** (or **nummular**) **eczema**, which is characterized by coin-shaped

lesions and occurs in adults, especially on the limbs; (4) **\*pompholyx**, affecting the palms and soles; (5) **gravitational** (or **stasis**) **eczema**, associated with poor venous circulation and incorrectly known as **varicose eczema**.

Treatment of eczema is with regular emollients and topical corticosteroids. Other treatments include topical **\*calcineurin inhibitors**, phototherapy, and systemic immunosuppressants. There is emerging evidence that effective treatment of eczema helps to reduce the risk of subsequently developing asthma and hay fever. —**eczematous** *adj.*

**eczema herpeticum (Kaposi's varicelliform eruption)** a skin eruption, typically in children or young adults, of widespread **\*vesicles** and ulcers caused by **\*herpes** simplex. This is due to impaired barrier function in skin with eczema. Clinical features include fever, malaise, and lymphadenopathy. Rarely, the infection may become systemic and be life-threatening. Eczema herpeticum is commonly misdiagnosed as a bacterial infection. Treatment is with systemic antivirals and hospitalization may be required.

**ED** emergency department, also known as **A & E** (accident and emergency department): a hospital department that assesses and deals with the immediate problems of acutely ill and injured patients. *See also* **A & E MEDICINE**.

**edentulous** *adj.* lacking teeth: usually applied to people who have lost some or all of their teeth.

**edetate** *n.* a salt of **ethylenediaminetetraacetic acid (EDTA)**, which is used as a **\*chelating agent** in the treatment of poisoning. **Dicobalt edetate** is an antidote to cyanide, administered as soon as possible after poisoning. **Sodium calcium edetate** is used to treat poisoning by heavy metals, especially lead.

**edrophonium** *n.* an **\*anticholinesterase** drug that is used after surgery to reverse the effects of nondepolarizing **\*muscle relaxants** and in a test for diagnosis of **\*myasthenia gravis**. Side-effects can include nausea and vomiting, increased saliva flow, diarrhoea, and stomach pains.

**EDTA (ethylenediaminetetraacetic acid)** *see* **EDETATE**.

**Edwards' syndrome** a condition resulting from a genetic abnormality in which an extra chromosome is present – there are three no. 18 chromosomes instead of the usual two. Affected babies, who rarely survive, have a characteristic abnormally shaped head, low birth weight, prominent heels ('rocker-bottom feet'), heart abnormalities, and severe learning disabilities. Prenatal screening (by *\*nuchal translucency scanning*) and diagnosis (by *\*amniocentesis* or *\*chorionic villus sampling*) are possible. [J. H. Edwards (1928–2007), British geneticist]

**EECP** *see* **ENHANCED EXTERNAL COUNTERPULSATION**.

**EEG (electroencephalogram)** *see* **ELECTROENCEPHALOGRAPHY**.

**EF** *see* **EJECTION FRACTION**.

**effectiveness and efficiency** *n.* measures that are used in health economics and ethics to assess treatments of all kinds. A treatment that works or achieves its object is **effective**, but may do so at great cost. If it is also **efficient**, it achieves its aim equally but at lower cost (or consumes less resources) when compared with other treatments. Such an assessment may be part of an *\*intervention study*. Even apparently effective and efficient treatments may work for patients only by depriving others of similar care (opportunity costs), so a moral evaluation must take into account the overall aims and purposes of health care in general.

**effector** *n.* any structure or agent that brings about activity in a muscle or gland, such as a motor nerve that causes muscular contraction or glandular secretion. The term is also used for the muscle or gland itself.

**effere** *adj.* **1.** designating nerves or neurons that convey impulses from the brain or spinal cord to muscles, glands, and other effectors; i.e. any motor nerve or neuron. **2.** designating vessels or ducts that drain fluid (such as lymph) from an organ or part. *Compare* **AFFERENT**.

**effleurage** *n.* a form of *\*massage* in which the hands are passed continuously and rhythmically over a patient's skin in one direction only, with the aim of increasing blood flow in that direction and aiding the dispersal of any swelling due to *\*oedema*.

**effusion** *n.* **1.** the escape of pus, serum, blood, lymph, or other fluid into a body cavity as a result of inflammation or the presence of excess blood or tissue fluid in an organ or tissue. **2.** fluid that has escaped into a body cavity. Such effusions may be exudates (rich in protein) or transudates (low in protein).

**eformoterol** *n.* *see* FORMOTEROL.

**eGFR** estimated *\*glomerular filtration rate*. Most estimates in clinical practice are based on the serum creatinine, age, gender, and race, with or without body weight. Examples are the *\*Cockcroft-Gault formula* and **MDRD eGFR** (modification of diet in renal disease study method of estimating glomerular filtration rate).

**EGFR** *see* EPIDERMAL GROWTH FACTOR RECEPTOR.

**egg cell** *see* OVUM.

**egg donation** *see* OOCYTE DONATION.

**ego** *n.* (in psychoanalysis) the part of the mind that develops from a person's experience of the outside world and is most in touch with external realities. In Freudian terms the ego is said to reconcile the demands of the *\*id* (the instinctive unconscious mind), the *\*superego* (moral conscience), and reality.

**Ehlers–Danlos syndrome** any one of a rare group of inherited (autosomal *\*dominant* or autosomal *\*recessive*) disorders of the connective tissue involving abnormal or deficient *\*collagen*, the protein that gives the body tissues strength. There are several types of differing severity. The skin of affected individuals is very elastic but also very fragile: it bruises easily and scars poorly, the scars often being paper-thin. The joints of those affected tend to be very mobile (double-jointed) and dislocate easily. In some types the uterus or bowel can rupture or the valves in the heart can be weaker than normal. [E. L. Ehlers (1863–1937), Danish dermatologist; H. A. Danlos (1844–1912), French dermatologist]

**EHS** *see* EXPLODING HEAD SYNDROME.

**eidetic** *adj.* *see* IMAGERY.

**eikonometer** *n.* an instrument for measuring the size of images on the retina of the eye.

**Eisenmenger reaction (Eisenmenger syndrome)** a condition in which **\*pulmonary hypertension** is associated with a **\*septal defect**, so that blood flows from the right to the left side of the heart or from the pulmonary artery to the aorta. This allows blue blood, poor in oxygen, to bypass the lungs and enter the general circulation. This reduces the oxygen content of the arterial blood in the aorta and its branches, resulting in a patient with a dusky blue appearance (**\*cyanosis**) and an increased number of red blood cells (**\*polycythaemia**). There is no curative treatment at this stage, but the patient may be helped by the control of heart failure and polycythaemia. The condition may be prevented by appropriate treatment of the septal defect in early childhood before irreversible pulmonary hypertension develops. [V. Eisenmenger (1864–1932), German physician]

**ejaculation** *n.* the discharge of semen from the erect penis at the moment of sexual climax (orgasm) in the male. The constituents of semen are not released simultaneously, but in the following sequence: the secretion of **\*Cowper's glands** followed by that of the **\*prostate gland** and the spermatozoa and finally the secretion of the **\*seminal vesicles**. *See also* **PREMATURE EJACULATION**.

**ejection fraction (EF)** the proportion or percentage of blood in the left **\*ventricle** that is ejected with each heartbeat. It is commonly used to quantify left ventricular function, the normal value being 50% or greater.

**Ekbom's syndrome** **1.** *see* **RESTLESS LEGS SYNDROME**. **2.** *see* **DELUSIONAL INFESTATION**. [K. A. Ekbom (1907–77), Swedish neurologist]

**elastase** *n.* an enzyme that breaks down various proteins including elastin, which has a role in the connective tissue matrix. **Pancreatic elastase**, secreted by the pancreas, is not degraded in the small or large intestine; therefore its concentration in the stools expresses the functioning of the pancreas, which is the basis for the **faecal pancreatic elastase** test. In patients who have suspected pancreatic insufficiency, faecal pancreatic elastase is suppressed or absent. Patients at risk include those with chronic

pancreatitis, cystic fibrosis, pancreatic cancer, or previous pancreatic surgery.

**elastic cartilage** a type of *\*cartilage* in which elastic fibres are distributed in the matrix. It is yellowish in colour and is found in the external ear.

**elastic tissue** strong extensible flexible *\*connective tissue* rich in yellow **elastic fibres**. These fibres are long, thin, and branching and are composed primarily of an albumin-like protein, **elastin**. Elastic tissue is found in the dermis of the skin, in arterial walls, and in the walls of the alveoli of the lungs.

**elastin** *n.* protein forming the major constituent of *\*elastic tissue* fibres.

**elastography** *n.* an ultrasonic imaging technique that displays the elasticity of soft tissues, most commonly using *\*ultrasound* although *\*magnetic resonance imaging* can be used to gather similar information. It has been found useful in demonstrating abnormalities of muscle, liver, and breast tissue.

**elastosis** *n.* degeneration of the yellow fibres in connective tissues and skin (*see* ELASTIC TISSUE).

**elation** *n.* a state of cheerful excitement and enthusiasm. Marked elation of mood is a characteristic of *\*mania* or *\*hypomania*.

**elbow** *n.* the hinge joint (*see* GINGLYMUS) between the bones of the upper arm (humerus) and the forearm (radius and ulna). It is a common site of fractures and dislocation.

**electrocardiogram (ECG)** *n.* a tracing of the electrical activity of the heart recorded by *\*electrocardiography* (*see* illustration). It aids in the diagnosis of heart disease, which may produce characteristic changes in the ECG. *See* QRS COMPLEX; Q–T INTERVAL; S–T SEGMENT.

**A typical electrocardiogram.**

**electrocardiography** *n.* a technique for recording the electrical activity of the heart. Electrodes connected to the recording apparatus (**electrocardiograph**) are placed on the skin of the four limbs and chest wall; the record itself is called an **\*electrocardiogram** (ECG). In conventional **scalar electrocardiography** 12 leads (see **LEAD<sup>2</sup>**) are recorded, but more may be employed in special circumstances. **Intracardiac electrocardiography** involves the passage of a recording catheter into the heart for accurate mapping and analysis of arrhythmias (see **ELECTROPHYSIOLOGICAL STUDY**).

**electrocardiophonography** *n.* a technique for recording heart sounds and murmurs simultaneously with the ECG, which is used as a reference tracing. The sound is picked up by a microphone placed over the heart. The tracing is a **phonocardiogram**. It provides a permanent record of heart sounds and murmurs and is useful in their analysis.

**electrocautery** *n.* the destruction of diseased or unwanted tissue by means of a needle or snare that is electrically heated. Warts, polyps, and other growths can be burned away by this method.

**electrocoagulation** *n.* the coagulation of body tissues by means of a high-frequency electric current concentrated at one point as it passes through them. Electrocoagulation, using a **\*diathermy** knife, permits bloodless incisions to be made during operation.

**electrocochleography (ECoG)** *n.* a test to measure electrical activity produced within the **\*cochlea** in response to a sound stimulus. It is used in

the diagnosis of Ménière's disease and other forms of sensorineural \*deafness.

**electroconvulsive therapy (ECT)** a treatment for severe depression and occasionally for \*puerperal psychosis, catatonia, and \*mania. A convulsion is produced by passing an electric current through the brain; this is thought to induce stimulation, and is modified by giving a \*muscle relaxant drug and an \*anaesthetic, so that in fact only a few muscle twitches are produced. The procedure can temporarily cause confusion and headache, which almost always pass off within a few hours. Patients often complain of memory problems during treatment, which normally subside when the treatment has ended. These side-effects are reduced by unilateral treatment, in which the current is passed only through the non-dominant hemisphere of the brain. A course of ECT usually entails between 6 and 10 treatments; sometimes up to 16 treatments are given to achieve remission of depression. ECT is effective in about 50% of patients in whom no other antidepressant treatment was successful, and NICE guidelines suggest it should be used in such cases. However, the beneficial effect on mood does not always last. Occasionally **maintenance ECT** (usually involving one treatment every 2–4 weeks) is given to avoid relapse after a completed course of ECT. Under the Mental Health Act 1983 (as amended 2007), special legal provision applies to ECT.

**electrodesiccation** *n.* *see* FULGURATION.

**electroencephalogram (EEG)** *n.* *see* ELECTROENCEPHALOGRAPHY.

**electroencephalography** *n.* the technique for recording the electrical activity from different parts of the brain and converting it into a tracing called an **electroencephalogram (EEG)**. The machine that records this activity is known as an **encephalograph**. The pattern of the EEG reflects the state of the patient's brain and his level of consciousness in a characteristic manner. Electroencephalography is mostly used in the diagnosis and management of epilepsy and sleep disorders.

**electroglottography** *n.* a method of assessing laryngeal function using external recording electrodes.

**electrolarynx** *n.* a battery-powered electrical vibrator that helps people to speak after \*laryngectomy.

**electrolyte** *n.* a solution that produces ions (an ion is an atom or group of atoms that conduct electricity); for example, sodium chloride solution consists of free sodium and free chloride ions. In medical usage electrolyte usually means the ion itself; thus the term **serum electrolyte level** means the concentration of separate ions (sodium, potassium, chloride, bicarbonate, etc.) in the circulating blood. Concentrations of various electrolyte levels can be altered by many diseases, in which electrolytes are lost from the body (as in vomiting or diarrhoea) or are not excreted and accumulate (as in renal failure). When electrolyte concentrations are severely diminished they can be corrected by administering the appropriate substance by mouth or by intravenous drip. When excess of an electrolyte exists it may be removed by **\*dialysis** or by special resins in the intestine, taken by mouth or by enema. *See also* **ANION**.

**electromyography** *n.* continuous recording of the electrical activity of a muscle by means of electrodes inserted into the muscle fibres. The tracing is displayed on an oscilloscope. The technique is used for diagnosing various nerve and muscle disorders and assessing progress in recovery from some forms of paralysis.

**electron microscope** a microscope that uses a beam of electrons as a radiation source for viewing the specimen. The resolving power (ability to register fine detail) is a thousand times greater than that of an ordinary light microscope. The specimen must be examined in a vacuum, which necessitates special techniques for preparing it, and the electrons are usually focused onto a fluorescent screen (for direct viewing) or onto a photographic plate (for a photograph, or **electron micrograph**). A **transmission electron microscope** is used to examine thin sections at high magnification. A **scanning electron microscope** reveals the surfaces of objects at various magnifications; its great depth of focus is advantageous.

**electron transport chain** a series of enzymes and proteins in living cells through which electrons are transferred, via a series of oxidation-reduction reactions. This ultimately leads to the conversion of chemical energy into a readily usable and storable form. The most important electron transport chain is the **respiratory chain**, present in mitochondria and functioning in cellular respiration.

**electronvolt** *n.* a unit of energy (symbol: eV) equal to the increase in the energy of an electron when it passes through a rise in potential of one volt. In clinical imaging, the energy of gamma rays is usually expressed in **kiloelectronvolts** (symbol: kV; 1 kV = 1000 eV).

**electrooculography** *n.* a method of recording eye movements and to assess the resting potential of the retina. Tiny electrodes are attached to the skin at the inner and outer corners of the eye, and as the eye moves an alteration in the potential between these electrodes is recorded. The recording itself is called an **electrooculogram (EOG)**.

**electrophoresis** *n.* the technique of separating electrically charged particles, particularly proteins, in a solution by passing an electric current through the solution. The rate of movement of the different components depends upon their charge, so that they gradually separate into bands. Electrophoresis is widely used in the investigation of body chemicals, such as the analysis of the different proteins in blood serum.

**electrophysiological study (EPS)** an assessment of the electrical system of the heart by means of thin preshaped wires passed into the heart via the femoral vein. An **\*electrocardiogram** is recorded from various points within the heart, and the reaction of the heart to timed electrical stimuli is observed. The information obtained guides treatment of arrhythmia, particularly **\*radiofrequency ablation**.

**electroretinography** *n.* a method of recording changes in the electrical potential of the retina when it is stimulated by light; the recording itself is called an **electroretinogram (ERG)**. One electrode is placed on the eye in a contact lens and the other is usually attached to the back of the head. In retinal disease the pattern of electrical change is altered. The technique is useful in diagnosing retinal diseases when opacities, such as cataract, make it difficult to view the retina or when the disease produces little visible change in the retina.

**electrosurgery** *n.* the use of a high-frequency electric current from a fine wire electrode (a **\*diathermy** knife) to cut tissue. The ground electrode is a large metal plate. When used correctly, little heat spreads to the surrounding tissues, in contrast to **\*electrocautery**.

**electrotherapy** *n.* the passage of electric currents through the body's tissues to stimulate the functioning of nerves and the muscles that they supply. The technique is used to treat the muscles of patients with various forms of paralysis due to nerve disease or muscle disorder. *See also* [FARADISM](#); [GALVANISM](#).

**electuary** *n.* a pharmaceutical preparation in which the drug is made up into a paste with syrup or honey.

**elephantiasis** *n.* gross enlargement of the skin and underlying connective tissues caused by obstruction of the lymph vessels, which prevents drainage of lymph from the surrounding tissues. Inflammation and thickening of the walls of the vessels and their eventual blocking is commonly caused by the parasitic filarial worms *Wuchereria bancrofti* and *Brugia malayi*. The parts most commonly affected are the legs but the scrotum, breasts, and vulva may also be involved. Elastic bandaging is applied to the affected parts and the limbs are elevated and rested. Larval forms in the blood are killed with diethylcarbamazine. *See also* [FILARIASIS](#).

**elevator** *n.* **1.** an instrument that is used to raise a depressed broken bone, for example in the skull or cheek. A specialized **periosteal elevator** is used in orthopaedics to strip the fibrous tissue (periosteum) covering bone. **2.** a lever-like instrument used to ease a tooth or root out of its socket during dental extraction.

**elimination** *n.* (in physiology) the entire process of excretion of metabolic waste products from the blood by the kidneys and urinary tract.

**elimination diet** a diet in which foods suspected of not being tolerated are removed for a period of time and then reintroduced sequentially to identify any that then precipitate symptoms (e.g. [\\*FODMAPS](#)). An **exclusion diet** is a variant of this, in which a single food is excluded and symptoms monitored for any improvements (e.g. a lactose-free diet).

**ELISA** *see* [ENZYME-LINKED IMMUNOSORBENT ASSAY](#).

**ELISPOT** enzyme-linked immunosorbent *spot* assay, used in monitoring the immune response. It specifically enumerates [\\*cytokine](#)-producing cells. Each spot that develops in the assay represents a single reactive cell.

**elixir** *n.* a preparation containing alcohol (ethanol) or glycerine, which is used as the vehicle for bitter or nauseous drugs.

**elliptocytosis** *n.* the presence of significant numbers of abnormal elliptical red cells (**elliptocytes**) in the blood. Elliptocytosis may occur as a hereditary disorder or be a feature of certain blood diseases, such as *\*myelofibrosis* or iron-deficiency *\*anaemia*.

**Elschnig pearls** round or oval transparent cystic structures on the posterior capsule of the lens due to proliferation of lens epithelial cells following extracapsular *\*cataract extraction*. They can grow to cover the central part of the capsule and cause reduction in vision. [A. Elschnig (1863–1939), German ophthalmologist]

**eltrombopag** *n.* a drug used in the treatment of chronic *\*idiopathic* thrombocytopenic purpura; it works by stimulating and increasing the production of platelets.

**elutriation** *n.* the separation of a fine powder from a coarser powder by mixing them with water and decanting the upper layer while it still contains the finer particles. The heavier coarse particles sink to the bottom more rapidly.

**em-** *prefix. see EN-*.

**emaciation** *n.* wasting of the body, caused by such conditions as malnutrition, tuberculosis, cancer, or parasitic worms.

**emasculation** *n.* strictly, surgical removal of the penis. The term is often used to mean loss of male physical and emotional characteristics, either as a result of removal of the testes (castration) or of emotional stress.

**embalming** *n.* the preservation of a dead body by the introduction of chemical compounds that delay putrefaction. Embalming is employed mainly so that a body can be transported long distances and funeral rites can be conducted without undue haste. In the USA it is a routine hygienic measure.

**embedding** *n.* (in microscopy) the fixing of a specimen within a mass of firm material in order to facilitate the cutting of thin sections for microscopical study. The embedding medium, e.g. paraffin wax for light microscopy or Araldite for electron microscopy, helps to keep the specimen intact.

**embolectomy** *n.* surgical removal of an **\*embolus** in order to relieve arterial obstruction. The embolus may be removed by cutting directly into the affected artery (**arteriotomy**). In some instances it is removed by a balloon **\*catheter**, which is manipulated beyond the embolus from a small arteriotomy in an accessible artery. The catheter is then withdrawn carrying the embolus with it. In some cases of pulmonary embolism, embolectomy may be life saving. It may also prevent gangrene in cases of a limb artery embolus.

**embolism** *n.* the condition in which an embolus becomes lodged in an artery and obstructs its blood flow. The most common form of embolism is **\*pulmonary embolism**, in which a blood clot is carried in the circulation to lodge in the pulmonary artery. An embolus in any other artery constitutes a **systemic embolism**. In this case a common source of the embolus is a blood clot within the heart in mitral valve disease or following **\*myocardial infarction**. The clinical features depend upon the site at which an embolus lodges (for example, a stroke may result from a cerebral embolism and gangrene caused by a limb embolism). Treatment is by **\*anticoagulant** therapy with heparin and warfarin. Major embolism is treated by **\*embolectomy** or **\*thrombolysis** to remove or dissolve the embolus. *See also* **AIR EMBOLISM**.

**embolization (therapeutic embolization)** *n.* the introduction of any material to reduce or completely obstruct blood flow. Conditions such as varicocele, fibroids, hepatoma, congenital arteriovenous malformations (*see* **ANGIOMA**), angiodysplasia, malignant tumours, or arterial rupture are commonly treated with embolization. Under X-ray screening control, a catheter is guided to the blood vessel (artery or vein) supplying the affected area and occluding material, such as microspheres, metallic coils, PVA (polyvinyl alcohol), or gel foam, is injected. The procedure may treat the underlying problem or simplify subsequent surgery. *See also* **CHEMOEMBOLIZATION**; **COILING**; **UTERINE ARTERY EMBOLIZATION**.

**embolus** *n.* (*pl.* **emboli**) material, such as a blood clot, fat, air, amniotic fluid, or a foreign body, that is carried by the blood from one point in the circulation to lodge at another point (*see* **EMBOLISM**).

**embrasure** *n.* the space formed between adjacent teeth.

**embrocation** *n.* a lotion rubbed onto the body to treat sprains and strains.

**embryo** *n.* an animal at an early stage of development, before birth. In humans the term refers to the products of conception within the uterus up to the eighth week of development, during which time all the main organs are formed (see illustration). *Compare* **FETUS**. —**embryonic** *adj.*

**An embryo.**

**embryology** *n.* the study of growth and development of the embryo and fetus from fertilization of the ovum until birth. —**embryological** *adj.*

**embryonic disc** the early embryo before the formation of **\*somites**. It is a flat disc of tissue bounded dorsally by the amniotic cavity and ventrally by the yolk sac. The formation of the **\*primitive streak** and **\*archenteron** in the embryonic disc determines the orientation of the embryo, which then becomes progressively elongated.

**embryo transfer** the transfer of an embryo from an in vitro culture into the uterus. *See also* **IN VITRO FERTILIZATION**.

**EMDR** *see* **EYE MOVEMENT DESENSITIZATION AND REPROCESSING THERAPY**.

**emergency contraception** *see* POSTCOITAL CONTRACEPTION.

**emesis** *n.* *see* VOMITING.

**emetic** *n.* an agent that causes vomiting. Substances such as common salt, which irritate the stomach nerves if taken in sufficient quantities, cause vomiting. Some emetics, e.g. *\*ipecacuanha*, are used as *\*expectorants* at low doses.

**eminence** *n.* a projection, often rounded, on an organ or tissue, particularly on a bone. An example is the **iliopubic eminence** on the hip bone.

**emissary veins** a group of veins within the skull that drain blood from the venous sinuses of the dura mater to veins outside the skull.

**emission** *n.* the flow of semen from the erect penis, usually occurring while the subject is asleep (**nocturnal emission**).

**EMLA cream** a cream containing a *eutectic mixture* of *local anaesthetics* (*\*lidocaine* and *\*prilocaine*; hence the name). Applied to the skin as a thick coating and left on for a maximum of 90 minutes, it gives a helpful degree of local anaesthesia, allowing blood samples to be taken and facilitating biopsy procedures in young children.

**emmetropia** *n.* the state of refraction of the normal eye, in which parallel light rays are brought to a focus on the retina with the accommodation relaxed. Distant objects are seen clearly without any effort to focus. *Compare* AMETROPIA; HYPERMETROPIA; MYOPIA.

**emollient** *n.* an agent that soothes and softens the skin. Emollients are fats and oils, such as lanolin and liquid paraffin; they are used alone as moisturizers to lessen the need for active drug therapy (such as corticosteroids for eczema) and in skin preparations as a base for a more active drug, such as an antibiotic.

**emotion** *n.* a state of arousal that can be experienced as pleasant or unpleasant. Emotions can have three components: **subjective**, **physiological**, and **behavioural**. For example, fear can involve an unpleasant subjective experience, an increase in physiological measures such as heart rate, sweating, etc., and a tendency to flee from the fear-provoking situation.

**emotionally unstable personality disorder** a *\*personality disorder* characterized by a tendency to act impulsively without consideration of the consequences, unpredictable and capricious mood, a tendency towards outbursts of emotion, inability to control behavioural explosions, quarrelsome behaviour, and conflict with others. There is an **impulsive type**, with particular emphasis on impulsivity and quarrelsome behaviour, especially when criticized; and a **borderline type**, with an emphasis on disturbance and uncertainty about self-image (including sexual preference), liability to become involved in intense and unstable relationships, excessive efforts to avoid abandonment, recurrent threats or acts of self-harm, and chronic feelings of emptiness. Treatments include cognitive analytical therapy (see **COGNITIVE THERAPY**), *\*antipsychotic* medication, and occasionally *\*SSRIs* and *\*lithium*. In DSM-5 the disorder is called **borderline personality disorder**.

**emotional touchpoints** a technique for encouraging users to talk about their experience of health care in subjective terms, thereby enabling providers to reflect on their practice and improve care delivery. Users are asked to talk about certain key moments of contact with the service (e.g. arrival on the ward, waking after an operation) and to characterize their experience using a selection of emotional words. The goal is to help staff to understand how users felt at these moments and thereby to develop more compassionate, holistic, and insightful care.

**empathy** *n.* the ability to imagine and understand the thoughts, perspective, and emotions of another person. In counselling and psychotherapy empathy is often considered to be one of the necessary qualities enabling a successful therapeutic relationship.

**emphysema** *n.* air in the tissues. In **pulmonary emphysema** the air sacs (*\*alveoli*) of the lungs are enlarged and damaged, which reduces the surface area for the exchange of oxygen and carbon dioxide. Severe emphysema causes breathlessness, which is made worse by infections. There is no specific treatment, and the patient may become dependent on oxygen. The mechanism by which emphysema develops is not understood, although it is known to be particularly common in men in Britain and is associated with chronic bronchitis, smoking, and advancing age. *See also* **CHRONIC OBSTRUCTIVE PULMONARY DISEASE**.

In **surgical emphysema** air may escape into the tissues of the chest and neck from leaks in the lungs or oesophagus; occasionally air escapes into other tissues during surgery, and bacteria may form gas in soft tissues. The presence of gas or air gives the affected tissues a characteristic crackling feeling to the touch, and it may be visible on X-rays. When air moves to the mediastinum the condition is known as **\*pneumomediastinum**. It is easily absorbed once the leak or production is stopped.

**empirical** *adj.* describing a system of treatment based on experience or observation, rather than of logic or reason.

**employment and support allowance** (in Britain) an allowance payable to people under state retirement age who are unable to work because of illness or disability. Entitlement depends on either an adequate record of National Insurance contributions or satisfying income-related criteria. An assessment-phase allowance is paid during the first 13 weeks of a claim, and eligible claimants are paid the main-phase rate following a work capability assessment. The part of this allowance based on income is currently being replaced by a component of **\*universal credit**; the part based on National Insurance contributions will remain in place.

**empowerment** *n.* giving or returning power to someone. Being ill is usually experienced as losing the ability to act as one wishes, and full recovery may only be achieved when the individual feels able to make their own decisions. This may be a problem where professionals insist on deciding for patients with certain conditions (e.g. mental illness). Empowerment involves action to redress the lack or **\*loss**, for instance by offering explanation in a language, style, and level that is appropriate. *See also* **AUTONOMY**; **FEMINIST ETHICS**; **PATERNALISM**.

**empty nose syndrome** an **\*iatrogenic** condition that can follow surgery to widen the internal nasal cavity, particularly **\*turbinectomy**. It is characterized by a sensation of dryness, and although the nasal cavity has been enlarged there is often a paradoxical feeling of nasal obstruction.

**empty sella syndrome** a congenital malformation of the bony structure (the **\*sella turcica**) that houses the pituitary gland such that the space is largely filled with cerebrospinal fluid, which squashes the usually spherical gland into a flattened shape against the floor of the sella. It is usually associated

with enlargement of the sella, which can be seen on lateral X-ray. Only 10% of cases of this condition have defective pituitary function.

**empyema (pyothorax)** *n.* pus in the \*pleural cavity, usually secondary to infection in the lung or in the space below the diaphragm. Empyema is a life-threatening condition, which can be relieved by aspiration or drainage of the pus or by decapsulation (see DECORTICATION).

**emulsion** *n.* a preparation in which fine droplets of one liquid (such as oil) are dispersed in another liquid (such as water). In pharmacy medicines are prepared in the form of emulsions to disguise the taste of an oil, which is dispersed in a flavoured liquid.

**en- (em-)** *prefix denoting in; inside.*

**enable** *vb.* to empower someone to undertake an action or to take responsibility for a situation. See EMPOWERMENT.

**enalapril** *n.* a drug used in the treatment of high blood pressure (hypertension) and heart failure. It inhibits the action of angiotensin (see ACE INHIBITOR), which results in decreased vasopressor (blood-vessel constricting) activity and decreased aldosterone secretion. Side-effects can include a persistent dry cough, a drastic fall in blood pressure, headache, dizziness, fatigue, and diarrhoea.

**enamel** *n.* the hard outer covering of the crown of a \*tooth. It is formed before tooth eruption by \*ameloblasts. The hardest substance in the human body, it is 96% mineral (primarily crystal \*hydroxyapatite).

**enarthrosis** *n.* a ball-and-socket joint: a type of \*diarthrosis (freely movable joint), e.g. the shoulder joint and the hip joint. Such a joint always involves a long bone, which is thus allowed to move in all planes.

**encapsulated** *adj.* (of an organ, tumour, bacterium, etc.) enclosed in a \*capsule.

**encephal- (encephalo-)** *combining form denoting the brain.*

**encephalin (enkephalin)** *n.* a peptide occurring naturally in the brain and having effects resembling those of morphine or other opiates. See also ENDORPHIN.

**encephalitis** *n.* inflammation of the brain. It may be caused by a viral or bacterial infection or it may be due to an abnormal autoimmune process, such as an allergic response to a systemic viral illness or vaccination (*see* **ENCEPHALOMYELITIS**), a remote response to malignancy (**paraneoplastic encephalitis**), or a primary antibody-mediated autoimmune disorder. Recently a number of antibody-mediated encephalitides have been described (voltage-gated potassium receptor and **\*NMDA-receptor** antibody being the commonest) that have characteristic clinical features and are often responsive to immunosuppressive therapies. **Viral encephalitis** is endemic in some parts of the world; it may also occur epidemically or sporadically. One form – **encephalitis lethargica** – reached epidemic proportions shortly after World War I and was marked by headache and drowsiness, progressing to coma (hence its popular name – **sleepy sickness**). Encephalitis can cause postencephalitic **\*parkinsonism**. Another type of encephalitis that occurs sporadically is due to the herpes simplex virus.

**encephalocele** *n.* *see* **NEURAL TUBE DEFECTS**.

**encephalography** *n.* any of various techniques for recording the structure of the brain or the activity of the brain cells. Examples are **\*electroencephalography** and **\*pneumoencephalography**.

**encephalomyelitis** *n.* an acute inflammatory disease affecting the brain and spinal cord. It is sometimes part of an overwhelming virus infection but **acute disseminated encephalomyelitis** (ADEM) is a form of delayed tissue hypersensitivity provoked by a mild infection or vaccination 7–10 days earlier. Survival through the acute phase of the illness is often followed by a remarkably complete recovery.

**encephalomyelopathy** *n.* any condition in which there is widespread disease of the brain and spinal cord. **Necrotizing encephalomyelopathy of childhood** is a progressive illness with extensive destruction of nerve cells throughout the central nervous system. It is thought to be caused by a disorder of metabolism.

**encephalon** *n.* *see* **BRAIN**.

**encephalopathy** *n.* any of various diseases that affect the functioning of the brain. *See* **HEPATIC ENCEPHALOPATHY**; **SPONGIFORM**

ENCEPHALOPATHY; WERNICKE'S ENCEPHALOPATHY.

**enchondroma** *n.* (*pl.* **enchondromata**) a benign cartilaginous tumour (*see* **CHONDROMA**) occurring within cortical bone, usually in the short tubular bones of the hands and feet. Such tumours are usually solitary and asymptomatic, but an enlarging lesion may fracture (the usual reason for presentation). When multiple tumours occur the condition is known as **enchondromatosis**. *Compare* **ECCHONDROMA**.

**encopresis** *n.* incontinence of faeces. The term is used for faecal soiling in a child who has gained bowel control but passes formed stools in unacceptable places. The underlying problem is behavioural and treatment is difficult, often requiring the input of a child psychiatrist. Encopresis must be distinguished from chronic constipation with overflow.

**encysted** *adj.* enclosed in a cyst.

**end- (endo-)** *combining form denoting* within or inner. Example: **endonasal** (within the nose).

**endarterectomy** *n.* a surgical 're-bore' of an artery that has become obstructed by **\*atheroma** with or without a blood clot (thrombus); the former operation is known as **thromboendarterectomy**. The inner part of the wall is removed together with any clot that is present. This restores patency and arterial blood flow to the tissues beyond the obstruction. The technique is most often applied to obstruction of the carotid arteries (**carotid endarterectomy**) or of the arteries that supply the legs.

**endarteritis** *n.* chronic inflammation of the inner (intimal) portion of the wall of an artery, which most often results from late syphilis. Thickening of the wall produces progressive arterial obstruction and symptoms from inadequate blood supply to the affected part (**\*ischaemia**). The arteries to the brain are often involved, giving rise to meningovascular syphilis. Endarteritis of the aorta may obstruct the mouths of the coronary arteries, supplying the heart. Endarteritis of the arteries to the wall of the aorta (the vasa vasorum) contributes to **\*aneurysm** formation. The syphilitic infection may be eradicated with penicillin.

**end artery** the terminal branch of an artery, which does not communicate with other branches. The tissue it supplies is therefore probably completely dependent on it for its blood supply.

**endemic** *adj.* occurring frequently in a particular region or population: applied to diseases that are generally or constantly found among people in a particular area. *Compare* **ECDEMIC**; **EPIDEMIC**; **PANDEMIC**.

**endemic syphilis** *see* **BEJEL**.

**endocarditis** *n.* inflammation of the lining of the heart cavity (endocardium) and valves. It is most often due to rheumatic fever or results from bacterial infection (**bacterial endocarditis**). Temporary or permanent damage to the heart valves may result. The main features are fever, changing heart murmurs, heart failure, and **\*embolism**. Treatment consists of rest and antibiotics; surgery may be required to repair damaged heart valves.

**endocardium** *n.* a delicate membrane, formed of flat endothelial cells, that lines the heart and is continuous with the lining of arteries and veins. At the openings of the heart cavities it is folded back on itself to form the cusps of the valves. It presents a smooth slippery surface, which does not impede blood flow. —**endocardial** *adj.*

**endocervicitis** *n.* inflammation of the mucous membrane that lines the cervix (neck) of the uterus, usually caused by infection. Surface cells (columnar epithelium) may die, resulting in a new growth of healthy epithelium over the affected area. The condition is accompanied by a thick mucoid discharge.

**endocervix** *n.* the mucous membrane lining the cervix (neck) of the uterus, which (like the **\*endometrium**) is covered with stratified columnar **\*epithelium**.

**endochondral** *adj.* within the material of a cartilage.

**endocrine gland (ductless gland)** a gland that manufactures one or more **\*hormones** and secretes them directly into the bloodstream (and not through a duct to the exterior). Endocrine glands include the pituitary, thyroid, parathyroid, and adrenal glands, the ovary and testis, the placenta, and part of the pancreas.

**endocrinology** *n.* the study of the **\*endocrine glands** and the substances they secrete (**\*hormones**). —**endocrinologist** *n.*

**endoderm** *n.* the inner of the three **\*germ layers** of the early embryo, which gives rise to the lining of most of the alimentary canal and its associated glands, the liver, gall bladder, and pancreas. It also forms the lining of the bronchi and alveoli of the lung and most of the urinary tract. —**endodermal** *adj.*

**endodermal sinus tumour** a rare tumour of fetal remnants of the ovaries or testes. In women it is an aggressive malignant ovarian tumour that develops in adolescence and may secrete alpha-fetoprotein and human chorionic gonadotrophin, which can be used as **\*tumour markers**. It is treated by oophorectomy with adjuvant chemotherapy.

**endodontics** *n.* the study, treatment, and prevention of diseases of the pulp of teeth and their sequelae. A major part of treatment is **\*root canal treatment**.

**end-of-life care** medication and other treatment to make a dying patient comfortable. *See* **HOSPICE**; **PALLIATIVE**.

**endogenous** *adj.* **1.** arising within or derived from the body. *Compare* **EXOGENOUS**. **2.** formerly (until the 1980s), denoting a type of **\*depression** (also known as **melancholia**) that was thought to arise totally biologically and therefore without any particular triggers. It stood in contrast to **reactive depression**, which was supposed to have been primarily triggered by stress or trauma. Today this differentiation is not usually made as the validity of separating these two types of depression could not be proven.

**endolymph** *n.* the fluid that fills the membranous **\*labyrinth** of the ear.

**endolymphatic duct** a blind-ended duct that leads from the sacculus and joins a duct from the utricle of the membranous **\*labyrinth** of the ear.

**endolymphatic sac** a dilatation at the end of the **\*endolymphatic duct** that removes waste products from the inner ear.

**endometrial ablation** the removal of the entire endometrium by means of an ablative technique under hysteroscopic control, usually performed as a day case or in a specialized out-patient clinic. It is an alternative to the more

traditional hysterectomies that were undertaken for the relief of **\*menorrhagia**. Methods for hysteroscopic endometrial ablation introduced in the 1980s included Nd: YAG (neodymium: yttrium–aluminium–garnet) laser ablation, **\*transcervical resection of the endometrium** (TCRE), and rollerball **\*electrocoagulation** (RBE). These first-generation procedures remain the gold standard for the hysteroscopic treatment of menorrhagia. Since the 1990s, the second generation of hysteroscopic ablation techniques have been developed. These include balloon thermal coagulation, in which a heated balloon is inserted into the uterus and destroys the endometrium; **microwave endometrial ablation (MEA)**, which vaporizes the endometrial tissue; and **Novasure**, which destroys the endometrium by **\*radiofrequency ablation**. About 75% of women obtain satisfactory improvement in their symptoms after these procedures.

**endometrial cancer** a malignant tumour of the lining (**\*endometrium**) of the uterus. Risk factors are nulliparity (never having given birth), obesity, and tamoxifen use as chemotherapy for breast cancer. The presenting symptom is usually **\*postmenopausal bleeding**, but this cancer may present with postmenopausal discharge or **\*pyometra**. The tumour invades the **\*myometrium** and spreads down to the cervix and through the Fallopian tubes to the ovaries and peritoneal cavity and through the lymphatics to pelvic and aortic nodes. Prognosis depends on tumour differentiation, depth of myometrial invasion, extent of tumour spread, and involvement of retroperitoneal nodes. Treatment is laparoscopic abdominal **\*hysterectomy** and bilateral **\*salpingo-oophorectomy**, with **\*lymphadenectomy** and radiotherapy if indicated.

**endometrial hyperplasia** an increase in the thickness of the cells of the **\*endometrium**, usually due to prolonged exposure to unopposed oestrogen, which can be endogenous, as in anovular menstrual cycles; or exogenous, deriving, for example, from **\*hormone replacement therapy** or an oestrogen-secreting tumour. It is classified as simple, complex, or atypical. Endometrial hyperplasia most commonly presents with abnormal uterine bleeding and accounts for 15% cases of postmenopausal bleeding. It may also be asymptomatic, and in some cases regresses spontaneously without ever being detected. The presence of atypical cells may lead to **\*endometrial cancer**.

Treatment can include progestogen therapy or surgery (*see* [ENDOMETRIAL ABLATION](#)); hysterectomy is advised when atypical changes are present.

**endometrioma** *n.* a complex [\\*ovarian cyst](#), usually with ‘chocolate’ material (altered blood) inside and associated with [\\*endometriosis](#). A history of cyclical enlargement of the nodule and painful periods is highly suggestive. There is a characteristic ground-glass appearance on transvaginal ultrasound and these cysts may be associated with a raised [\\*CA125](#) level. Endometriomas are not amenable to medical therapy and should be surgically excised.

**endometriosis** *n.* the presence of fragments of endometrial tissue at sites in the pelvis outside the uterus or, rarely, throughout the body (e.g. in the lung, rectum, or umbilicus). It is thought to be caused by retrograde [\\*menstruation](#). When the tissue has infiltrated the wall of the uterus (myometrium) the condition is known as **adenomyosis**. Symptoms vary, but typically include pelvic pain, severe [\\*dysmenorrhoea](#), [\\*dyspareunia](#), infertility, and a pelvic mass (or any combination of these). Medical treatment is aimed at suppressing ovulation using [\\*gonadorelin analogues](#), combined oral contraceptives, or the intrauterine system (*see* [IUS](#)). High-dose progestogens suppress [\\*gonadotrophins](#) (FSH and LH), shrink implanted endometrial tissue, and reduce retrograde menstruation. They have a similar efficacy to other medical treatments, are cheaper, and have fewer side-effects than gonadorelin analogues. Surgical treatment may also be necessary, usually by laser or ablative therapy via the laparoscope. More radical surgical treatment in the form of a total hysterectomy and bilateral salpingo-oophorectomy is sometimes required.

**endometritis** *n.* inflammation of the [\\*endometrium](#) due to acute or chronic infection. It may be caused by foreign bodies, bacteria, viruses, or parasites. In the acute phase it may occur in the period immediately after childbirth (puerperium) but the chronic phase may not be associated with pregnancy (as in tuberculous endometritis). Chronic endometritis in women with IUDs may be responsible for the contraceptive action.

**endometrium** *n.* the mucous membrane lining the uterus, which is covered with columnar [\\*epithelium](#). It becomes progressively thicker and more glandular and has an increased blood supply in the latter part of the menstrual

cycle. This prepares the endometrium for implantation of the embryo, but if this does not occur much of the endometrium breaks down and is lost in menstruation. If pregnancy is established the endometrium becomes the *\*decidua*, which is shed after birth. — **endometrial** *adj.*

**endomorph** *adj.* describing a *\*body type* that is relatively fat, with highly developed viscera and weak muscular and skeletal development. — **endomorph** *n.* — **endomorphism** *n.*

**endomorphin** *n.* *see* **ENDORPHIN**.

**endomyocarditis** *n.* an acute or chronic inflammatory disorder of the muscle and lining membrane of the heart. When the membrane surrounding the heart (pericardium) is also involved the condition is termed **pancarditis**. The principal causes are rheumatic fever and virus infections. There is enlargement of the heart, murmurs, embolism, and frequently arrhythmias. The treatment is that of the cause and complications. *See also* **ENDOCARDITIS**.

A chronic condition, **endomyocardial fibrosis**, is seen in Black Africans: the cause is unknown.

**endomysium** *n.* the fine connective tissue sheath that surrounds a single *\*muscle* fibre.

**endonasal** *adj.* within or through the nose: describing minimally invasive techniques that allow access through the nose to correct problems. Such procedures are performed by an ENT or ophthalmic surgeon or a neurosurgeon.

**endoneurium** *n.* the layer of fibrous tissue that separates individual fibres within a *\*nerve*.

**endoparasite** *n.* a parasite that lives inside its host, for example in the liver, lungs, gut, or other tissues of the body. *Compare* **ECTOPARASITE**.

**endopeptidase** *n.* a digestive enzyme (e.g. *\*pepsin*) that splits a whole protein into small peptide fractions by splitting the linkages between peptides in the interior of the molecule. *Compare* **EXOPEPTIDASE**. *See also* **PEPTIDASE**.

**endophthalmitis** *n.* inflammation, usually due to infection, within the eye.

**endophytic** *adj.* describing growth inwards from an epithelial surface due to invasion of the surrounding tissues. Endophytic growth is characteristic of carcinomas. *Compare* **EXOPHYTIC**.

**endoplasm** *n.* the inner cytoplasm of cells, which is less dense than the **\*ectoplasm** and contains most of the cell's structures. —**endoplasmic** *adj.*

**endoplasmic reticulum (ER)** a system of membranes present in the cytoplasm of cells. ER is described as **rough** when it has **\*ribosomes** attached to its surface and **smooth** when ribosomes are absent. It is the site of manufacture of proteins and lipids and is concerned with the transport of these products within the cell (*see also* **GOLGI APPARATUS**).

**endopyelotomy** *n.* a procedure for relieving obstruction of the junction between the kidney pelvis and ureter. An incision is made, via an endoscope, through the obstructed junction, using electrocautery, laser, or an endoscopic scalpel. Following this, **\*balloon** dilation is usually performed and a **\*stent** inserted.

**end organ** a specialized structure at the end of a peripheral nerve, acting as a receptor for a particular sensation. Taste buds, in the tongue, are end organs subserving the sense of taste.

**endorphin (endomorphin)** *n.* one of a group of chemical compounds, similar to the **\*encephalins**, that occur naturally in the brain and have pain-relieving properties similar to those of the opiates. They are also responsible for sensations of pleasure. The endorphins are derived from a substance found in the pituitary gland known as **beta-lipotrophin**; they are thought to be concerned with controlling the activity of the endocrine glands.

**endoscope** *n.* any instrument used to obtain an interior view of a hollow organ or body cavity. Examples of endoscopes include the **\*auriscope** and the **\*gastroscope**. Most endoscopes consist of a rigid or flexible tube, a light source, and an image-capturing system (either optical or digital) to deliver the images to the operator. *See also* **VIDEO CAPSULE ENDOSCOPY**; **FIBRESCOPE**. —**endoscopic** *adj.* —**endoscopy** *n.*

**endoscopic retrograde cholangiopancreatography** *see* **ERCP**.

**endoscopic sinus surgery (ESS)** surgery of the \***paranasal sinuses** using endoscopes. **Functional endoscopic sinus surgery (FESS)** clears inflamed tissue from routes of sinus drainage and aeration to allow the other sinuses to return to normal.

**endoscopic ultrasound** the fusion of endoscopy with ultrasonography. An ultrasound probe is incorporated into the endoscope in order to deliver highly detailed images from within the body. Endoscopic ultrasound is used predominantly by gastroenterologists, to assess internal structures or organs within the upper gastrointestinal tract, or by respiratory physicians in the assessment of bronchial disease. It may be used for diagnostic purposes, to accurately stage a confirmed diagnosis of cancer or to obtain tissue samples using fine-needle aspiration. Therapeutic indications include drainage of a pancreatic \***pseudocyst**, the common bile duct, or the pancreatic duct, and **coeliac plexus neurolysis**, a technique used to deliver pain relief in cases of intractable abdominal pain, usually resulting from chronic pancreatitis.

**endospore** *n.* the resting stage of certain bacteria, particularly species of the genera *Bacillus* and *Clostridium*. In adverse conditions the bacterium can become enclosed within a tough protective coat, allowing the cell to survive. On return of favourable conditions the spore changes back to the vegetative form.

**endostapler** *n.* a stapling instrument (*see* **STAPLE**) used endoscopically for fixing tissues or joining them together.

**endosteum** *n.* the membrane that lines the marrow cavity of a bone.

**endothelin** *n.* any one of a class of peptide hormones, consisting of chains of 21 amino acids, that are synthesized by endothelial cells, often of large blood vessels. They are the most powerful known stimulants of smooth muscle (such as that in the walls of arteries) and are believed to be important causes of hypertension. The drug **bosentan**, which blocks receptors for endothelin-1, is administered by mouth for the treatment of pulmonary hypertension.

**endothelioma** *n.* any tumour arising from or resembling endothelium. It may arise from the linings of blood or lymph vessels (**haemangioendothelioma** and **lymphangioendothelioma** respectively); from the linings of the pleural

cavity or the peritoneal cavity (see [MESOTHELIOMA](#)); or from the meninges (see [MENINGIOMA](#)).

**endothelium** *n.* the single layer of cells that lines the heart, blood vessels, and lymphatic vessels. It is derived from embryonic mesoderm. The **corneal endothelium** is the innermost layer of the [\\*cornea](#). Compare [EPITHELIUM](#).  
—**endothelial** *adj.*

**endothermic** *adj.* describing a chemical reaction associated with the absorption of heat. Compare [EXOTHERMIC](#).

**endotoxin** *n.* a poison generally harmful to all body tissues, contained within certain Gram-negative bacteria and released only when the bacterial cell is broken down or dies and disintegrates. Compare [EXOTOXIN](#).

**endotracheal** *adj.* within or through the trachea (windpipe). See [INTUBATION](#).

**endovascular** *adj.* within a blood vessel: describing procedures for imaging the circulation or for treating vascular disorders from within the circulation, including [\\*angioplasty](#), the placement of [\\*stents](#) or coils in aneurysms (see [ENDOASCULAR ANEURYSM REPAIR](#); [COILING](#)), and [\\*embolization](#). Endovascular procedures are usually performed by an interventional radiologist or a vascular surgeon.

**endovascular aneurysm repair (EVAR)** a recently developed technique that involves the insertion of a covered metal [\\*stent](#) into an [\\*aneurysm](#). The stent lines the aneurysm and thereby excludes it from the circulation, preventing further expansion and rupture. The delivery system containing the stents is introduced through the common femoral artery. [\\*Fluoroscopy](#) provides real-time imaging to guide placement of the stents and ensure they are in the correct anatomical position.

**endovenous laser treatment (EVLT)** a minimally invasive procedure to treat [\\*varicose veins](#). A laser fibre (usually an 810-nm [\\*diode laser](#)) contained within a sheath is fed into the vein by ultrasound guidance and slowly withdrawn as it is fired, thereby delivering laser energy that causes irreversible destruction and eventual ablation of the vein.

**end-plate** *n.* the area of muscle cell membrane immediately beneath the motor nerve ending at a **\*neuromuscular junction**. Special receptors in this area trigger muscular contraction when the nerve ending releases its **\*neurotransmitter**.

**end-stage renal failure (ESRF, CKD 5)** the most advanced stage of kidney failure, which is reached when the **\*glomerular filtration rate** (GFR) falls to 15 ml/min (normal GFR = 100 ml/min).

**enema** *n.* (*pl.* **enemata** or **enemas**) a quantity of fluid infused into the rectum through a tube passed into the anus. An **evacuant enema** (soap or olive oil) is used to remove faeces. A **therapeutic enema** is used to insert drugs into the rectum, commonly corticosteroids or aminosalicylates in the treatment of **\*proctocolitis**. *See also* **BARIUM ENEMA**; **SMALL-BOWEL ENEMA**.

**enervation** *n.* **1.** weakness; loss of strength. **2.** the surgical removal of a nerve.

**engagement** *n.* (in obstetrics) the stage of pregnancy that occurs when the presenting part of the fetus has descended into the mother's pelvis. Engagement of the fetal head occurs when the widest part has passed through the pelvic inlet.

**enhanced external counterpulsation (EECP)** an experimental treatment for patients with intractable angina. Specially designed inflatable trousers are inflated rhythmically in time with ventricular **\*diastole**. Theoretically this imparts additional energy to the circulating blood volume when the heart is relaxed, and this may improve blood flow down severely narrowed coronary arteries. It is also claimed to have beneficial effects on blood flow to other organs. Despite promising clinical trials, this technique has not been widely adopted.

**enkephalin** *n.* *see* **ENCEPHALIN**.

**enophthalmos** *n.* a condition in which the eye is abnormally sunken into the socket. It may follow fractures of the floor of the orbit that allow the eye to sink downwards and backwards.

**enoxaparin sodium** *see* **LOW-MOLECULAR-WEIGHT HEPARIN**.

**enoximone** *n.* an **\*inotropic** drug used in the treatment of congestive heart failure to increase the force and output of the heart.

**ensiform cartilage** *see* **XIPHOID PROCESS**.

**ENT** *see* **OTORHINOLARYNGOLOGY**.

**Entamoeba** *n.* a genus of widely distributed amoebae, of which some species are parasites of the digestive tract of humans. *E. histolytica* invades and destroys the tissues of the intestinal wall, causing amoebic **\*dysentery** and ulceration of the gut wall (*see also* **AMOEBOMA**); infection of the liver with this species (amoebic hepatitis) is common in tropical countries. *E. coli* is a harmless intestinal parasite; *E. gingivalis*, found within the spaces between the teeth, is associated with periodontal disease and gingivitis.

**enter-** (**entero-**) *combining form denoting* the intestine. Example: **enterolith** (calculus in).

**enteral** *adj.* of or relating to the intestinal tract.

**enteral feeding** the process by which nutrients are delivered to the gut through a feeding tube – a **\*nasogastric tube**, nasojejunal tube, a PEG tube (*see* **GASTROSTOMY**), or a **\*jejunostomy** tube. **Polymeric feeds** contain whole fats, protein, carbohydrates, vitamins, and minerals. Feeds that are easier to digest include **peptide feeds** (containing short protein chains instead of whole protein) and **elemental feeds** (containing amino acids rather than whole proteins). *See* **ARTIFICIAL NUTRITION AND HYDRATION**; **NUTRITION**.

**enteralgia** *n. see* **COLIC**.

**enterectomy** *n.* surgical removal of part of the small intestine.

**enteric** *adj.* relating to or affecting the intestine.

**enteric-coated** *adj.* describing tablets that are coated with a substance that enables them to pass through the stomach and into the intestine unchanged. Enteric-coated tablets contain drugs that are destroyed by the acid contents of the stomach.

**enteric fever** *see* PARATYPHOID FEVER; TYPHOID FEVER.

**enteritis** *n.* inflammation of the small intestine, usually causing diarrhoea. **Infective enteritis** is caused by infectious pathogens, such as viruses and bacteria; **radiation enteritis** is a complication of radiation therapy for pelvic and abdominal malignancies. It can cause fistulae, stricture formation, and malabsorption. *See also* GASTROENTERITIS.

**enterobiasis (oxyuriasis)** *n.* a disease, common in children throughout the world, caused by the parasitic nematode *Enterobius vermicularis* (*see* THREADWORM) in the large intestine. The worms do not cause any serious lesions of the gut wall although, rarely, they may provoke appendicitis. The emergence of the female from the anus at night irritates and inflames the surrounding skin, causing the patient to scratch and thereby contaminate fingers and nails with infective eggs. The eggs may reinfect the same child or be spread to other children. Worms may occasionally enter the vulva and cause a discharge from the vagina. Enterobiasis responds well to treatment with \*mebendazole.

**Enterobius (Oxyuris)** *n. see* THREADWORM.

**enterocele** *n.* a hernia of the \*pouch of Douglas (between the rectum and uterus) into the upper part of the posterior vaginal wall. It may contain loops of small bowel.

**enterocentesis** *n.* a former name for a surgical procedure in which a hollow needle is pushed through the wall of the stomach or intestines to release an abnormal accumulation of gas or fluid or to introduce a catheter for feeding (*see* GASTROSTOMY; ENTEROSTOMY).

**enteroclysis** *n. see* SMALL-BOWEL ENEMA.

**Enterococcus** *n.* a genus of spherical Gram-positive bacteria formerly classified as species of \**Streptococcus*. They are normal inhabitants of the human and animal intestine but a few species, notably *E. faecalis* and *E. faecium*, can cause infections in humans. They are responsible for some hospital-acquired infections and have been found in teeth with persisting disease after root canal treatment. Enterococci have the ability to survive under adverse (starvation) conditions and are therefore difficult to eradicate;

there is concern at the development of strains resistant to glycopeptide antibiotics, such as **\*vancomycin** (**glycopeptide-resistant enterococci, GRE**).

**enterocolitis** *n.* inflammation of the colon and small intestine. *See also* COLITIS; ENTERITIS; NECROTIZING ENTEROCOLITIS.

**enterogastrone** *n.* a hormone from the small intestine (duodenum) that inhibits the secretion of gastric juice by the stomach. It is released when the stomach contents pass into the small intestine.

**enterogenous** *adj.* of intestinal origin.

**enterokinase** *n.* the former name for **\*enteropeptidase**.

**enterolith** *n.* a stone within the intestine. It usually builds up around a gallstone or a swallowed fruit stone.

**enteropathic arthritis** an inflammatory arthritis associated with gastrointestinal disease, such as **\*inflammatory bowel disease**.

**enteropathy** *n.* disease of the small intestine. *See also* COELIAC DISEASE (GLUTEN-SENSITIVE ENTEROPATHY).

**enteropeptidase** *n.* an enzyme secreted by the glands of the small intestine that acts on trypsinogen to produce **\*trypsin**.

**enterorrhaphy** *n.* the surgical procedure of stitching an intestine that has either perforated or been divided during an operation.

**enteroscope** *n.* an illuminated optical instrument (*see* ENDOSCOPE) used to inspect the interior of the small intestine. The image is transmitted through digital video technology. The examination can be performed using the oral and/or anal approach. The double balloon (**push and pull**) type, about 280 cm long with a distal balloon combined with an **\*overtube** with a proximal balloon, is introduced under direct vision. Double balloon inflation and deflation helps in progression of the endoscope through the small intestine and is the predominant type in current use. The **sonde** (or **push**) type, about 280 cm long, has a single inflatable balloon that helps pull the instrument through the length of the intestine using peristalsis. It is now rarely used in clinical practice. The enteroscope is useful in diagnosing the cause of

obscure gastrointestinal haemorrhage of the small intestine or of *\*stricture(s)*. It may also be used to treat bleeding lesions, remove small intestinal polyps, and to obtain tissue samples in suspected cases of malabsorption, inflammation, or intestinal tumours. —**enteroscopy** *n.*

**enterostomy** *n.* an operation in which the small intestine is brought through the abdominal wall and opened (*see* **DUODENOSTOMY**; **JEJUNOSTOMY**; **ILEOSTOMY**) or is joined to the stomach (**gastroenterostomy**) or to another loop of small intestine (**enteroenterostomy**).

**enterotomy** *n.* surgical incision into the intestine.

**enterotoxin** *n.* a poisonous substance that has a particularly marked effect upon the gastrointestinal tract, causing vomiting, diarrhoea, and abdominal pain.

**enterovirus** *n.* any virus that enters the body through the gastrointestinal tract, multiplies there, and then (generally) invades the central nervous system. Enteroviruses include *\*Coxsackie viruses* and *\*polioviruses*.

**enterozoon** *n.* any animal species inhabiting or infecting the gut of another. *See also* **ENDOPARASITE**.

**enthesis** *n.* (*pl.* **entheses**) **1.** the site of insertion of tendons or ligaments into bones. **2.** the insertion of synthetic inorganic material to replace lost tissue.

**enthesopathy** *n.* any rheumatic disease resulting in inflammation of *\*entheses*. Ankylosing *\*spondylitis*, *\*psoriatic arthritis*, and *\*reactive arthritis* are examples. In these conditions the Achilles tendon is commonly involved, with swelling at its insertion on the calcaneus. Calcification within the tendon insertion may be seen on X-ray in patients with longstanding enthesopathy.

**Entonox** *see* **NITROUS OXIDE**.

**entoptic phenomena** visual sensations caused by changes within the eye itself, rather than by the normal light stimulation process. The commonest are tiny floating spots (**floaters**) that most people can see occasionally, especially when gazing at a brightly illuminated background (such as a blue sky).

**entrapment neuropathy** pain, muscle wasting, and paralysis resulting from pressure on a nerve in conditions in which it is subjected to compression by surrounding structures. *See* [CARPAL TUNNEL SYNDROME](#).

**entropion** *n.* inturning of the eyelid towards the eyeball. The lashes may rub against the eye and cause irritation (*see* [TRICHIASIS](#)). The commonest type is **spastic entropion** of the lower eyelid, due to spasm of the muscle that closes the eye (orbicularis oculi). Entropion may also be caused by scarring of the lining membrane (conjunctiva) of the lid.

**enucleation** *n.* the complete removal of an organ, tumour, or cyst leaving surrounding structures intact. In ophthalmology it is an operation in which the eyeball is removed but the other structures in the socket (e.g. eye muscles) are left in place. Commonly a plastic ball is buried in the socket to give a better cosmetic result when fitting an artificial eye.

**enuresis** *n.* the involuntary passing of urine. The most common form is bedwetting (**nocturnal enuresis**) by children (the majority of children are dry during the day by the age of three years and at night by four). Nocturnal enuresis is occasionally caused by underlying disorders of the urinary tract, particularly infection, but in the majority of children the problem is behavioural; there is often a family history. The condition usually settles spontaneously as the child grows older, but it may persist into teenage – and rarely adult – life. It can be treated by behavioural techniques, such as the use of a nocturnal alarm (*see* [BELL AND PAD](#)) or *\*reinforcement* of periods of continence with a reward system, or by drug treatment. Enuresis that starts in adulthood is usually associated with a disorder of the bladder, a side-effect of medication, or a neurological disease, such as multiple sclerosis. *See also* [INCONTINENCE](#). —**enuretic** *adj.*

**environment** *n.* any or all aspects of the surroundings of an organism, both internal and external, which influence its growth, development, and behaviour.

**Environmental Health Officer (EHO)** a person, employed by a local authority, with special training in such aspects of environmental health as housing, pollution, and food safety (formerly known as a **Public Health**

**Inspector**). EHOs work closely with other professionals within the local authority and with other agencies, including [\\*Public Health England](#).

**environmental hearing aid** any of various devices for helping people with hearing difficulties. Environmental aids include [\\*assistive listening devices](#) and **alerting devices**, such as door bells with visible as well as audible alarms, infrared links to televisions, and vibrating alarm clocks.

**enzyme** *n.* a protein that, in small amounts, speeds up the rate of a biological reaction without itself being used up in the reaction (i.e. it acts as a catalyst). An enzyme acts by binding with the substance involved in the reaction (the **substrate**) and converting it into another substance (the **product** of the reaction). An enzyme is relatively specific in the type of reaction it catalyses; hence there are many different enzymes for the various biochemical reactions. Each enzyme requires certain conditions for optimum activity, particularly correct temperature and pH, the presence of [\\*coenzymes](#), and the absence of specific inhibitors. Enzymes are unstable and are easily inactivated by heat or certain chemicals. They are produced within living cells and may act either within the cell (as in cellular respiration) or outside it (as in digestion). The names of enzymes usually end in ‘-ase’; enzymes are named according to the substrate upon which they act (as in lactase), or the type of reaction they catalyse (as in hydrolase).

Enzymes are essential for the normal functioning and development of the body. Failure in the production or activity of a single enzyme may result in metabolic disorders; such disorders are often inherited and some have serious effects. —**enzymatic** *adj.*

**enzyme-linked immunosorbent assay (ELISA)** a sensitive technique for measuring the amount of a substance. An antibody that will bind to the substance is produced; the amount of an easily measured enzyme that then binds to the antibody complex enables accurate measurement.

**EOG** *see* [ELECTROOCULOGRAPHY](#).

**eosin** *n.* a red acidic dye, produced by the reaction of bromine and fluorescein, used to stain biological specimens for microscopical examination. Eosin may be used in conjunction with a contrasting blue alkaline dye taken up by different parts of the same specimen.

**eosinopenia** *n.* a decrease in the number of eosinophils in the blood.

**eosinophil** *n.* a variety of white blood cell distinguished by a lobed nucleus and the presence in its cytoplasm of coarse granules that stain orange-red with **\*Romanowsky stains**. Eosinophils are capable of ingesting foreign particles, is present in large numbers in lining or covering surfaces within the body, is involved in allergic responses, and may be involved in host defence against parasites. There are normally  $40\text{--}400 \times 10^6$  eosinophils per litre of blood. *See also* **POLYMORPH**.

**eosinophilia** *n.* an increase in the number of eosinophils in the blood. Eosinophilia occurs in response to certain drugs and in a variety of diseases, including allergies, parasitic infestations, and certain forms of leukaemia.

**eosinophilic granulomatosis with polyangiitis** *see* **CHURG–STRAUSS SYNDROME**.

**EPA (eicosapentaenoic acid)** *see* **OMEGA-3 FATTY ACIDS**.

**eparterial** *adj.* situated on or above an artery.

**ependyma** *n.* the extremely thin membrane, composed of cells of the **\*glia** (**ependymal cells**), that lines the ventricles of the brain and the choroid plexuses. It is responsible for helping to form cerebrospinal fluid. — **ependymal** *adj.*

**ependymoma** *n.* a cerebral tumour derived from the glial (non-nervous) cells lining the cavities of the ventricles of the brain (*see* **EPENDYMA**). It may obstruct the flow of cerebrospinal fluid, causing a **\*hydrocephalus**.

**epheiatrics (heiatrics)** *n.* the branch of medicine concerned with the common disorders of adolescents. *Compare* **PAEDIATRICS**.

**ephedrine** *n.* a drug that causes constriction of blood vessels and widening of the bronchial passages (*see* **SYMPATHOMIMETIC**). It is used mainly as a nasal **\*decongestant** but also to reverse hypotension following epidural or spinal anaesthesia. It may cause nausea, insomnia, headache, and dizziness.

**epi-** *prefix denoting above or upon.*

**epiblepharon** *n.* a fold of skin, present from birth, stretching across the eye just above the lashes of the upper eyelid or in front of them in the lower lid. It may cause the lower lashes to turn upwards or inwards against the eye. It usually disappears within the first year of life.

**epicanthus (epicanthic fold)** *n.* (*pl.* epicanthi) a vertical fold of skin from the upper eyelid that covers the inner corner of the eye. Epicanthi are normal in many Asian peoples and occur abnormally in certain congenital conditions, e.g. **\*Down's syndrome**. —**epicanthal, epicanthic** *adj.*

**epicardia** *n.* the part of the **\*oesophagus**, about 2 cm long, that extends from the level of the diaphragm to the stomach.

**epicardium** *n.* the outermost layer of the heart wall, enveloping the myocardium. It is a serous membrane that forms the inner layer of the serous **\*pericardium**. —**epicardial** *adj.*

**epicondyle** *n.* the protuberance above a **\*condyle** at the end of an articulating bone.

**epicranium** *n.* the structures that cover the cranium, i.e. all layers of the scalp.

**epicranius** *n.* the muscle of the scalp. The **frontal** portion, at the forehead, is responsible for raising the eyebrows and wrinkling the forehead; the **occipital** portion, at the base of the skull, draws the scalp backwards.

**epicritic** *adj.* describing or relating to sensory nerve fibres responsible for the fine degrees of sensation, as of temperature and touch. *Compare* **PROTOPATHIC**.

**epidemic** *n.* a sudden outbreak of infectious disease that spreads rapidly through the population, affecting a large proportion of people. The commonest epidemics today are of influenza. *Compare* **ENDEMIC**; **PANDEMIC**. —**epidemic** *adj.*

**epidemiology** *n.* the study of the distribution of diseases and determinants of disease in populations. Originally restricted to the study of epidemic infectious diseases, such as smallpox and cholera, it now covers all forms of disease that relate to the environment and ways of life. It thus includes the

study of the links between smoking and cancer, and diet and coronary disease, as well as **\*communicable diseases**.

**epidermal growth factor receptor (EGFR)** a protein on the surface of cells (see **RECEPTOR**) that binds with epidermal **\*growth factor** and is therefore involved in cell division. EGFR is expressed at increased levels in numerous tumours, particularly of the head and neck, and in colorectal cancer, in which it can be a target for antibody therapy with **\*cetuximab**. **\*Tyrosine kinase inhibitors** acting specifically on the EGFR include **gefitinib** and **erlotinib** in lung and pancreatic cancer.

**epidermis** *n.* the outer layer of the **\*skin**, which is divided into four layers (see illustration). The innermost **Malpighian** or **germinative layer (stratum germinativum)** consists of continuously dividing cells. The other three layers are continually renewed as cells from the germinative layer are gradually pushed outwards and become progressively impregnated with keratin (see **KERATINIZATION**). The outermost layer (**stratum corneum**) consists of dead cells whose cytoplasm has been entirely replaced by keratin. It is thickest on the soles of the feet and palms of the hands. — **epidermal** *adj.*

**A section of epidermis.**

**epidermoid** *adj.* having the appearance of epidermis (the outer layer of the skin): used to describe certain tumours of tissues other than the skin.

**epidermoid cyst** see **SEBACEOUS CYST**.

**epidermolysis bullosa** any one of a group of genetically determined disorders characterized by blistering of skin and mucous membranes that occurs secondarily to minor mechanical trauma. Many different types exist: milder cases are restricted to skin and mucosal fragility; other types may be complicated by the development of skin squamous cell carcinomas (dystrophic) or death in early childhood due to overwhelming sepsis or airway involvement.

**Epidermophyton** *n.* a genus of fungi that grow on the skin, causing **\*ringworm**. See also **DERMATOPHYTE**.

**epidiascope** *n.* an apparatus for projecting a greatly magnified image of an object, such as a specimen on a microscope slide, on to a screen.

**epididymectomy** *n.* the surgical removal or excision of the epididymis.

**epididymis** *n.* (*pl.* **epididymides**) a highly convoluted tube, about seven metres long, that connects the **\*testis** to the vas deferens. The spermatozoa are moved passively along the tube over a period of several days, during which time they mature and become capable of fertilization. They are concentrated and stored in the lower part of the epididymis until ejaculation. —**epididymal** *adj.*

**epididymitis** *n.* inflammation of the epididymis. The usual cause is infection spreading down the vas deferens from the bladder or urethra, resulting in pain, swelling, and redness of the affected half of the scrotum. The inflammation may spread to the testicle (**epididymo-orchitis**). Treatment is by administration of antibiotics and analgesics.

**epididymovasostomy** *n.* the operation of connecting the vas deferens to the epididymis to bypass obstruction of the latter in an attempt to cure **\*azoospermia** caused by this blockage. It is also performed to reverse vasectomy as an alternative to **\*vasovasostomy**.

**epidural (extradural)** *adj.* on or over the dura mater (the outermost of the three membranes covering the brain and spinal cord). The **epidural space** is the space between the dura mater of the spinal cord and the vertebral canal. The spinal epidural space is used for anaesthetizing spinal nerve roots (*see* **EPIDURAL ANAESTHESIA**).

**epidural anaesthesia** suppression of sensation in the lower part of the body by the injection of a local anaesthetic into the **\*epidural** space. The injection site is often the sacral or lumbar regions of the vertebral column, and a special blunt needle with a side-hole is used to reduce the chance of penetrating the dura. A fine catheter is passed through the needle to enable repeated or continuous infusion of anaesthetic solution. Epidural anaesthesia is particularly useful for providing pain relief during childbirth, to reduce the need for deep general anaesthesia, and for postoperative analgesia.

**epigastrium** *n.* the upper central region of the **\*abdomen**. —**epigastric** *adj.*

**epigastrocele** *n.* a **\*hernia** through the upper central region of the abdominal wall.

**epiglottis** *n.* a thin leaf-shaped flap of cartilage, covered with mucous membrane, situated immediately behind the root of the tongue. It covers the entrance to the **\*larynx** during swallowing.

**epiglottitis** *n.* an infection of the epiglottis, which swells and causes obstruction of the upper airways. Epiglottitis usually occurs in children between one and seven years old, who complain of drooling and breathing difficulties and are acutely unwell. The main bacterium that causes epiglottitis is *Haemophilus influenzae*, and the infection has become much less common since the **\*Hib vaccine** was introduced. Treatment consists of antibiotics and, if necessary, intubation. Children should be nursed in intensive care until the infection is under control.

**epikeratophakia** *n.* eye surgery to correct errors of **\*refraction** in which the curvature of the cornea is altered using donor corneal tissue, which has been frozen and shaped using a lathe to produce a tissue lens that is then sutured onto the cornea.

**epilation** *n.* the removal of a hair by its roots. This can be done mechanically (by plucking, waxing, or threading) or by use of topical creams, electrolysis, and lasers.

**epilepsy** *n.* a disorder of brain function characterized by recurrent seizures that have a sudden onset. The term **idiopathic** is used to describe epilepsy that is not associated with structural damage to the brain. Seizures may be generalized or partial. **Generalized epilepsy** may take the form of tonic-

clonic or absence seizures. In **tonic-clonic** (or **major**) **seizures** (formerly called **grand mal**), the patient falls to the ground unconscious with the muscles in a state of spasm. The lack of any respiratory movement may result in a bluish discoloration of the skin and lips (cyanosis). This – the tonic phase – is replaced by convulsive movements (the clonic phase) when the tongue may be bitten and urinary incontinence may occur. Movements gradually cease and the patient may rouse in a state of confusion, complaining of headache, or may fall asleep. **Absence seizures** (formerly called **petit mal** in children) consist of brief spells of unconsciousness lasting for a few seconds, during which posture and balance are maintained. The eyes stare blankly and there may be fluttering movements of the lids and momentary twitching of the fingers and mouth. The electroencephalogram characteristically shows bisynchronous spike and wave discharges (3 per second) during the seizures and at other times. Attacks are sometimes provoked by overbreathing or intermittent photic stimulation. As the stream of thought is completely interrupted, children with frequent seizures may have learning difficulties. This form of epilepsy seldom appears before the age of three or after adolescence. It often subsides spontaneously in adult life, but it may be followed by the onset of major or partial epilepsy.

In **partial** (or **focal**) **seizures**, the nature of the seizure depends upon the location of the damage in the brain. For example, a simple partial motor seizure consists of convulsive movements that might spread from the thumb to the hand, arm, and face (this spread of symptoms is called the **Jacksonian march**); there is no loss of awareness. **Complex partial seizures** are commonly caused by damage to the cortex of the temporal lobe or the adjacent parietal lobe of the brain: this form of epilepsy is often called **temporal lobe** (or **psychomotor**) **epilepsy**. Symptoms may include *\*hallucinations* of smell, taste, sight, and hearing, paroxysmal disorders of memory, and *\*automatism*. Throughout an attack the patient is in a state of clouded awareness and afterwards may have no recollection of the event (*see also* **DÉJÀ VU**; **JAMAIS VU**). A number of these symptoms are due to scarring and atrophy (mesial temporal sclerosis) affecting the temporal lobe.

The different forms of epilepsy can be controlled by the use of antiepileptic drugs (*see* **ANTICONVULSANT**). Surgical resection of focal epileptogenic lesions in the brain is appropriate in a strictly limited number of cases. *See also* **AURA**; **POSTICTAL PHASE**. —**epileptic** *adj., n.*

<https://www.epilepsy.org.uk/>

- Website of Epilepsy Action: includes practical advice for people living with epilepsy

**epileptogenic** *adj.* having the capacity to provoke epileptic seizures.

**epiloia** *n.* *see* TUBEROUS SCLEROSIS.

**epimysium** *n.* the fibrous elastic tissue that surrounds a \*muscle.

**epinephrine** *n.* *see* ADRENALINE.

**epineural** *adj.* derived from or situated on the neural arch of a vertebra.

**epineurium** *n.* the outer sheath of connective tissue that encloses the bundles (fascicles) of fibres that make up a \*nerve.

**epinucleus** *n.* tissue surrounding the relatively hard lens nucleus, between the nucleus and the softer cortex of the lens.

**epiphenomenon** *n.* an unusual symptom or event that may occur simultaneously with a disease but is not necessarily directly related to it. *Compare* COMPLICATION.

**epiphora** *n.* watering of the eye, in which tears flow onto the cheek. It is due to some abnormality of the tear drainage system (*see* LACRIMAL APPARATUS).

**epiphysis** *n.* (*pl.* **epiphyses**) **1.** the end of a long bone, which is initially separated by cartilage from the shaft (diaphysis) of the bone and develops separately. It eventually fuses with the diaphysis to form a complete bone. *See also* PHYSIS. **2.** *see* PINEAL GLAND. —**epiphyseal** *adj.*

**epiphysitis** *n.* inflammation of the end (epiphysis) of a long bone. It may result in retardation of growth and deformity of the affected bone.

**epiplo-** *combining form denoting* the omentum. Example: **epiplocele** (hernia containing omentum).

**epiploon** *n.* *see* OMENTUM.

**epiretinal membrane (cellophane maculopathy)** a transparent membrane that forms on the retina, over the **\*macula**. Contraction of this causes wrinkling of the retina (**macular pucker**) and hence distorted vision.

**epirubicin** *n.* *see* **ANTHRACYCLINE**.

**episclera** *n.* the outermost covering of the **\*sclera** of the eye, which provides nutritional support to the sclera.

**episcleritis** *n.* inflammation of the **\*episclera**, resulting in a red painful eye that is sensitive to light. It is usually a benign condition, which will settle without treatment.

**episio-** *combining form denoting the vulva.* Example: **episioplasty** (plastic surgery of).

**episiotomy** *n.* an incision into the tissues surrounding the opening of the vagina (perineum) during a difficult birth, at the stage when the infant's head has partly emerged through the opening of the birth passage. The aim is to enlarge the opening in a controlled manner so as to make delivery easier and to avoid extensive tearing of adjacent tissues.

**episode** *n.* *see* **FINISHED CONSULTANT EPISODE**.

**episodic cranial sensory shock** *see* **EXPLODING HEAD SYNDROME**.

**epispadias** *n.* a congenital abnormality in which the opening of the **\*urethra** is on the dorsal (upper) surface of the penis. It can be associated with **\*exstrophy**. Surgical correction is carried out in infancy.

**epistasis** *n.* **1.** the stopping of a flow or discharge, as of blood. **2.** a type of gene action in which one gene can suppress the action of another (nonallelic) gene. The term is sometimes used for any interaction between nonallelic genes. —**epistatic** *adj.*

**epistaxis** *n.* bleeding from the nose, which is a very common condition. Although there is usually no obvious underlying cause, epistaxis can be caused by low-grade bacterial infection of the front of the nose, hypertension, clotting disorders, or tumours of the nose or sinuses. Treatments include pinching the bottom part of the nostrils together, cauterizing the bleeding vessel, or packing the nose with preformed packs, antiseptic gauze, or

specially designed inflatable balloons. Occasionally surgery is required to interrupt the flow of blood to the nose. *See* [LITTLE'S AREA](#); [KIESSELBACH'S PLEXUS](#).

**epithalamus** *n.* part of the forebrain, consisting of a narrow band of nerve tissue in the roof of the third ventricle (including the region where the choroid plexus is attached) and the [\\*pineal gland](#). *See also* [BRAIN](#).

**epithalaxia** *n.* loss of layers of epithelial cells from the lining of the intestine.

**epithelial ingrowth** abnormal healing of a corneal wound or incision in which the conjunctival/corneal epithelium invades the internal surface of the healing wound. The consequences of this can be devastating to the eye and difficult to treat.

**epithelioma** *n.* a tumour of [\\*epithelium](#), the covering of internal and external surfaces of the body: a former name for [\\*carcinoma](#).

**epithelium** *n.* the tissue that covers the external surface of the body and lines hollow structures (except blood and lymphatic vessels). It is derived from embryonic ectoderm and endoderm. Epithelial cells may be flat and scalelike (**squamous**), **cuboidal**, or **columnar**. The latter may bear cilia or brush borders or secrete mucus or other substances (*see* [GOBLET CELL](#)). The cells rest on a common **basement membrane**, which separates epithelium from underlying [\\*connective tissue](#). Epithelium may be either **simple**, consisting of a single layer of cells; **stratified**, consisting of several layers; or **pseudostratified**, in which the cells appear to be arranged in layers but in fact share a common basement membrane (see illustration). *See also* [ENDOTHELIUM](#); [MESOTHELIUM](#). —**epithelial** *adj.*

Stratified squamous epithelium, surface view above and sectional view below

basement membrane

Simple cuboidal epithelium

Ciliated columnar epithelium

### Types of epithelium.

**epitrichium (periderm)** *n.* the most superficial layer of the skin, one cell in thickness, that is only present early in embryonic development. It protects the underlying **\*epidermis** until it is fully formed.

**Epley particle repositioning manoeuvre** a series of head and body movements used to move microscopic debris from the posterior **\*semicircular canal** in the inner ear. It is used in the treatment of **\*benign paroxysmal positional vertigo**.

**EPO** *see* **ERYTHROPOIETIN**.

**epoetin (recombinant human erythropoietin)** *n.* any of four forms of **\*erythropoietin** produced by genetic engineering – **epoetin alfa**, **epoetin beta**, **epoetin theta**, or **epoetin zeta** – used for treating anaemia associated with chronic renal failure or induced by chemotherapy. **Darbepoetin alfa** and **methoxy polyethylene glycol-epoetin beta** are derivatives of epoetin with similar uses but longer duration of action. Side-effects include diarrhoea, raised blood pressure, headache, and flulike symptoms.

**eponychium** *n. see* **NAIL**.

**eponym** *n.* a disease, structure, or species named after a particular person, usually the person who first discovered or described it. Eponyms are widespread in medicine, but they are being replaced as more descriptive terms become necessary. Thus the eponyms islets of Langerhans, aqueduct of Sylvius, and Hashimoto's disease are more likely to be designated in text books as pancreatic islands, cerebral aqueduct, and autoimmune thyroiditis, respectively. —**eponymous** *adj.*

**epoophoron** *n. see* **PAROOPHORON**.

**epoprostenol** *n.* a prostaglandin drug (*see* **PROSTACYCLIN**) used immediately before and during renal dialysis to prevent clotting of blood in the shunt and also to treat primary **\*pulmonary hypertension**. Side-effects include flushing, headache, and hypotension.

**EPS** *see* **ELECTROPHYSIOLOGICAL STUDY**.

**Epstein–Barr virus (EB virus, EBV, human herpesvirus 4, HHV-4)** the virus, belonging to the **\*herpesvirus** group, that is the causative agent of **\*glandular fever**. It attacks B **\*lymphocytes**. EB virus is also implicated in hepatitis and in certain cancers (e.g. **\*Burkitt's lymphoma** and **\*Hodgkin's disease**). [Sir M. A. Epstein (1921– ) and Y. M. Barr (1932– ), British pathologists]

**epulis** *n.* a swelling on the gum or alveolar mucosa. There are three types: fibromatous (originating from the fibrous tissues in the mouth), ossifying (originating from fibrous and bony tissues), and acanthomatous (emerging

from the periodontal ligament). A **parulis** is an epulis at the opening of a **\*sinus** tract.

**Epworth Sleepiness Scale** a questionnaire to assess the likelihood of falling asleep. It is used to investigate sleep disorders, including **\*obstructive sleep apnoea**.

**equality** *n.* in medical ethics, the principle that cases with an equal moral status should be treated equally. This means, most obviously, that patients with the same clinical needs should not be treated differently on morally irrelevant grounds, such as race (*see* **DISCRIMINATION**), and are afforded identical rights, respect, and value. However, there is much debate over what characteristics are morally important when medical resources need to be rationed; for example, whether a patient's age or **\*quality of life** is morally important. *See* **JUSTICE**.

**Equality and Human Rights Commission** a nondepartmental public body set up in 2007 to promote human rights and equality in regard to age, disability, gender, race, religion and belief, pregnancy and maternity, marriage and civil partnership, sexual orientation, and human rights. It replaced the **Commission for Racial Equality**, the **Disability Rights Commission**, and the **Equal Opportunities Commission**.

**equi-** *combining form denoting equality.*

**equinia** *n. see* **GLANDERS**.

**equipoise** *n.* a state of genuine and substantial uncertainty as to which of two or more courses of action will be best for a patient. Equipoise is an important ethical principle in research, specifically in the design of clinical trials. It is generally held that the random allocation of patients to one or other arm of a trial is ethically acceptable only where there is a genuine uncertainty (equipoise) as to which treatment will most benefit trial participants. Knowingly to assign an individual to inferior or ineffective treatment (such as a placebo) would offend against the principle that his or her **\*best interests** are paramount. A distinction is sometimes made between **clinical equipoise**, which refers to uncertainty across the medical profession as a whole, and **theoretical equipoise**, which refers to the uncertainty of an individual doctor. In addition, patients may not share the state of equipoise;

for example, if a patient has his or her own preferences and there are significant side-effects influencing the choice of treatment, it would be *\*paternalistic* and counter to *\*beneficence* not to respect that patient's wishes.

**equity** *n.* the absence of disparities in those aspects of health that can be controlled and modified. Discussion of equity usually accepts that complete health *\*equality* is impossible, as some factors (such as genetic differences) are not modifiable.

**Erb's palsy** weakness or paralysis of the shoulder and arm usually caused by injury to the upper roots of the *\*brachial plexus* during traumatic childbirth. This may happen if, during a difficult delivery, excess traction applied to the head damages the fifth and sixth cervical roots of the spinal cord. The muscles of the shoulder and the flexors of the elbow are paralysed and the arm hangs at the side internally rotated at the shoulder with the forearm pronated (**waiter's-tip deformity**). Recovery may be spontaneous, but in some cases nerve grafts or muscle transfers are required. [W. H. Erb (1840–1921), German neurologist]

**ERCP (endoscopic retrograde cholangiopancreatography)** the technique in which a catheter is passed through a *\*duodenoscope* into the *\*ampulla* of Vater of the common bile duct and injected with a radiopaque medium to outline the pancreatic duct and bile ducts radiologically. Magnetic resonance cholangiopancreatography (MRCP; *see* **CHOLANGIOGRAPHY**) is often used to diagnose biliary and pancreatic disease followed by ERCP for diagnostic confirmation and therapeutic intervention. ERCP facilitates the removal of gallstones from the common bile duct, biopsy of lesions, and insertion of biliary *\*stents*. *See also* **PAPILLOTOMY**.

**erectile** *adj.* capable of causing erection or becoming erect. The penis is composed largely of erectile tissue.

**erectile dysfunction** inability in a male to obtain and/or maintain a penile erection to enable vaginal penetration for sexual intercourse. There are many causes and contributing factors; often a combination of physical causes and psychological factors is responsible for the condition. The physical causes include peripheral vascular disease, diabetes mellitus, certain medications, hypogonadism or other endocrine disorders, and anatomical abnormalities of

the penis. Treatments that work by increasing blood flow to the cavernous sinuses of the penis include oral *\*sildenafil* and injectable *\*alprostadil*. Penile *\*prostheses* can be surgically inserted into the penis when other treatments have not been effective.

**erection** *n.* the sexually active state of the penis, which becomes enlarged and rigid (due to the erectile tissue being swollen with blood) and capable of penetrating the vagina. The term is also applied to the clitoris in a state of sexual arousal.

**erepsin** *n.* a mixture of protein-digesting enzymes (*see* **PEPTIDASE**) secreted by the intestinal glands. It is part of the *\*succus entericus*.

**erethism** *n.* **1.** a state of abnormal mental excitement or irritability. **2.** rapid response to a stimulus.

**erg** *n.* a unit of work or energy equal to the work done when the point of application of a force of 1 dyne is displaced through a distance of 1 centimetre in the direction of the force. 1 erg =  $10^{-7}$  joule.

**ERG** *see* **ELECTRORETINOGRAPHY**.

**erg-** (**ergo-**) *combining form denoting* work or activity.

**ergocalciferol** *n. see* **VITAMIN D**.

**ergograph** *n.* an apparatus for recording the work performed by the muscles of the body when undergoing activity. Ergographs are useful for assessment of the capabilities of athletes undergoing training.

**ergometrine** *n.* a drug that stimulates contractions of the uterus. Combined with *\*oxytocin*, it is administered by intramuscular injection to assist the final stage of labour and to control bleeding following incomplete miscarriage.

**ergonomics** *n.* the study of humans in relation to their work and working surroundings. This broad science involves the application of psychological as well as physiological principles to the design of buildings, machinery, vehicles, packaging, implements, and anything else with which people come into contact.

**ergosterol** *n.* a plant sterol that, when irradiated with ultraviolet light, is converted to ergocalciferol (vitamin D<sub>2</sub>). See **VITAMIN D**.

**ergot** *n.* a fungus (*Claviceps purpurea*) that grows on rye. It produces several important alkaloids, chemically related to LSD, including **\*ergotamine** and **\*ergometrine**, which are used in medicine in the treatment of migraine and in childbirth. Eating bread made with rye infected with the fungus has led to sporadic outbreaks of **\*ergotism** over the centuries.

**ergotamine** *n.* a drug that causes constriction of blood vessels and is used to relieve migraine. It is administered in combination with cyclizine and caffeine. Common side-effects are nausea and vomiting, and ergotism may develop as a result of high doses; because of this it has largely been superseded by **\*5HT<sub>1</sub> agonists**.

**ergotism** *n.* poisoning caused by eating rye infected with the fungus **\*ergot**. The chief symptom is gangrene of the fingers and toes, with diarrhoea and vomiting, nausea, and headache. In the Middle Ages the disease was known as **St Anthony's fire**, because of the inflamed appearance of the tissues afflicted with gangrene and the belief that a pilgrimage to St Anthony's tomb would result in cure.

**erlotinib** *n.* see **EPIDERMAL GROWTH FACTOR RECEPTOR; TYROSINE KINASE INHIBITOR**.

**erogenous** *adj.* describing certain parts of the body, the physical stimulation of which leads to sexual arousal.

**erosion** *n.* **1.** an eating away of surface tissue by physical or chemical processes, including those associated with inflammation. In the skin, an erosion represents a superficial type of ulceration and therefore heals quite readily. **2.** (in dentistry) loss of non-carious tooth surface, usually caused by repeated application of acid, which softens the enamel. It may result from excessive intake of fruit juice, carbonated drinks, or acidic fruits or by regurgitation of acid from the stomach, as in bulimia nervosa, hiatus hernia, alcoholism, or stress (see **GASTRO-OESOPHAGEAL REFLUX DISEASE**). The teeth become very sensitive. The aetiology should be identified and corrected; severe cases may require extensive dental restorations.

**erot-** (**eroto-**) *combining form denoting sexual desire or love.* Example: **erotophobia** (morbid dread of).

**erotomania** (**de Clérambault syndrome**) *n.* a delusion that the individual is loved by some person, often a person of importance. It can be a symptom of a **\*monodelusional disorder** or part of a mental illness, such as dementia or schizophrenia.

**error** *n.* (in research) incorrectly rejecting a null hypothesis when it is true (**type I error**) or failing to reject a null hypothesis when it is false (**type II error**). See **SIGNIFICANCE**.

**eructation** *n.* belching: the sudden raising of gas from the stomach.

**eruption** *n.* **1.** the outbreak of a rash. A **bullous eruption** is an outbreak of blisters. **2.** (in dentistry) the emergence of a growing tooth from the gum into the mouth.

**erysipelas** *n.* a streptococcal infection of the skin, especially the face, characterized by redness and swelling; it usually has a sharply defined margin, which may differentiate erysipelas from the otherwise similar **\*cellulitis**. The patient is ill, with a high temperature. Phenoxymethylpenicillin (**\*penicillin V**) is the treatment of choice.

**erysipeloid** *n.* an infection of the skin and underlying tissues with **\*Erysipelothrix insidiosa**, developing usually in people handling fish, poultry, or meat. Infection enters through scratches or cuts on the hands, and is normally confined to a finger or hand, which becomes reddened; sometimes systemic illness develops. Treatment is with penicillin.

**Erysipelothrix** *n.* a genus of Gram-positive nonmotile rod-shaped bacteria with a tendency to form filaments. They are parasites of mammals, birds, and fish. *E. insidiosa* (formerly *E. rhusiopathiae*) is a widely distributed species causing the disease **\*erysipeloid**.

**erythema** *n.* flushing of the skin due to dilatation of the blood capillaries in the dermis. It may be physiological or a sign of inflammation or infection. **Erythema nodosum** is characterized by tender bruise-like swellings on the shins and is often associated with streptococcal infection. In **erythema multiforme** the eruption, which can take various forms, is characterized by

so-called ‘target lesions’ that may be recurrent and follow herpes simplex infection (especially in children) or medications (especially in adults). **Erythema ab igne** is a reticular pigmented rash on the lower legs or elsewhere caused by persistent exposure to radiant heat. **Erythema infectiosum (fifth disease, slapped cheek syndrome)** is a common benign infectious disease of children caused by erythrovirus (human *\*parvovirus B19*). It is characterized by fever and a rash, first on the cheeks and later on the trunk and extremities, that disappears after several days. **Erythema toxicum neonatorum (neonatal urticaria)** is a common self-limiting asymptomatic rash appearing in up to half of newborns, usually 2–5 days after birth. It is characterized by small erythematous papules and pustules surrounded by a diffuse blotchy erythematous halo. The eruption typically resolves within the first two weeks of life. *See also* **PALMAR ERYTHEMA**. —**erythematous** *adj.*

**erythr-** (**erythro-**) *combining form denoting* **1.** redness. Example: **erythuria** (excretion of red urine). **2.** erythrocytes.

**erythrasma** *n.* a chronic skin infection due to the bacterium *Corynebacterium minutissimum*, occurring in such areas as the armpits, groin, and toes, where skin surfaces are in contact. It fluoresces coral-pink under *\*Wood’s light* and can be treated with topical or systemic antibiotics.

**erythroblast** *n.* any of a series of nucleated cells (*see* **NORMOBLAST**; **PROERYTHROBLAST**) that pass through a succession of stages of maturation to form red blood cells (*\*erythrocytes*). Erythroblasts are normally present in the blood-forming tissue of the bone marrow, but they may appear in the circulation in a variety of diseases (*see* **ERYTHROBLASTOSIS**). *See also* **ERYTHROPOIESIS**.

**erythroblastosis** *n.* the presence in the blood of the nucleated precursors of the red blood cells (*\*erythroblasts*). This may occur when there is an increase in the rate of red cell production, as in haemorrhagic or haemolytic *\*anaemia*, or in infiltrations of the bone marrow by tumours, etc.

**erythroblastosis foetalis** a severe but rare haemolytic *\*anaemia* affecting newborn infants due to destruction of the infant’s red blood cells by factors

present in the mother's serum. It is usually caused by incompatibility of the rhesus blood groups between mother and infant (see [RHESUS FACTOR](#)).

**erythrocyanosis** *n.* mottled purplish discoloration on the legs and thighs, usually of adolescent girls or obese boys before puberty. The disorder sometimes occurs in older women and is worse in cold weather. Weight loss is the best treatment because it reduces the insulating effect of a thick layer of fat.

**erythrocyte (red blood cell)** *n.* a [\\*blood cell](#) containing the red pigment [\\*haemoglobin](#), the principal function of which is the transport of oxygen. A mature erythrocyte has no nucleus and its shape is that of a biconcave disc, approximately 7 µm in diameter. There are normally about  $5 \times 10^{12}$  erythrocytes per litre of blood. *See also* [ERYTHROPOIESIS](#).

**erythrocyte sedimentation rate** *see* [ESR](#).

**erythrocytic** *adj.* describing those stages in the life cycle of the malarial parasite (see [PLASMODIUM](#)) that develop inside the red blood cells (see [TROPHOZOITE](#)). *Compare* [EXOERYTHROCYTIC](#).

**erythroderma (exfoliative dermatitis)** *n.* abnormal reddening, flaking, and thickening of the skin affecting a wide area of the body. Commoner after the age of 50, erythroderma affects men three times as often as women; it may result from pre-existing skin disease, such as eczema or psoriasis, or be caused by drugs or lymphoma. This clinical picture is a form of acute skin failure.

**erythroedema** *n.* *see* [PINK DISEASE](#).

**erythrogenesis** *n.* a former name for [\\*erythropoiesis](#).

**erythromelalgia** *n.* painful paroxysmal dilation of the blood vessels of the skin, usually affecting the extremities; the skin feels hot. Some patients may respond to aspirin.

**erythromycin** *n.* an antibiotic used to treat respiratory and other infections caused by a wide range of bacteria. Side-effects are rare and mild, though nausea, vomiting, and diarrhoea occur occasionally.

**erythron** *n.* circulating mature red blood cells and that part of the blood-forming system of the body that is directed towards the production of red blood cells. The erythron is not a single organ but is dispersed throughout the blood-forming tissue of the **\*bone marrow**. *See also* **ERYTHROPOIESIS**.

**erythropenia** *n.* a reduction in the number of red blood cells (**\*erythrocytes**) in the blood. This usually, but not invariably, occurs in **\*anaemia**.

**erythroplasia** *n.* an abnormal red patch of skin that occurs particularly in the mouth or on the genitalia and is precancerous. **Erythroplasia of Queyrat** is a nonkeratinizing **\*carcinoma** in situ affecting the glans of the penis or the inner surface of the prepuce. It is ten times more likely to progress to invasive squamous cell carcinoma than is **\*Bowen's disease** of the penis. *Compare* **LEUKOPLAKIA**.

**erythropoiesis** *n.* the process of red blood cell (**\*erythrocyte**) production, which normally occurs in the blood-forming tissue of the **\*bone marrow**. The ultimate precursor of the red cell is the **\*haemopoietic stem cell**, but the earliest precursor that can be identified microscopically is the **\*proerythroblast**. This divides and passes through a series of stages of maturation termed respectively early, intermediate, and late **\*normoblasts**, the latter finally losing its nucleus to become a mature red cell. *See also* **HAEMOPOIESIS**.

**erythropoietin (EPO)** *n.* a hormone secreted by certain cells in the kidney in response to a reduction in the amount of oxygen reaching the tissues. Erythropoietin increases the rate of red cell production (**\*erythropoiesis**) and is the mechanism by which the rate of erythropoiesis is controlled. Genetically engineered forms of the hormone are used for treating certain anaemias (*see* **EPOETIN**; **ESA**).

**erythroptia** *n.* red vision: a symptom sometimes experienced after removal of a cataract and also in snow blindness.

**erythrovirus** *n.* *see* **PARVOVIRUS**.

**ESA** erythropoiesis-stimulating agent: a substance similar to the hormone **\*erythropoietin**, which stimulates red blood cell production (erythropoiesis). Examples include the commercial **\*epoetin** products.

**eschar** *n.* a scab or slough, as produced by the action of heat or a corrosive substance on living tissue.

**Escherichia** *n.* a genus of Gram-negative, generally motile, rodlike bacteria that have the ability to ferment carbohydrates, usually with production of gas, and are found in the intestines of humans and many animals. *E. coli* – a lactose-fermenting species – is usually not harmful but some strains cause gastrointestinal infections. Ingestion of the pathogenic serotype *E. coli* O157, derived from infected meat, causes colitis with bloody diarrhoea, which may give rise to the complications of \*haemolytic uraemic syndrome or thrombocytopenic \*purpura (see also FOOD POISONING). *E. coli* is widely used in laboratory experiments for bacteriological and genetic studies.

**escitalopram** *n.* see SSRI.

**esophoria** *n.* a tendency to squint in which the eye, when covered, tends to turn inwards towards the nose. The eye always straightens on removal of the cover. See also HETEROPHORIA.

**esotropia** *n.* convergent squint (see STRABISMUS).

**espundia (mucocutaneous leishmaniasis)** *n.* a disease of the skin and mucous membranes caused by the parasitic protozoan *Leishmania braziliensis* (see LEISHMANIASIS). Occurring in South and Central America, espundia takes the form of ulcerating lesions on the arms and legs; the infection may also spread to the mucous membranes of the nose and mouth, causing serious destruction of the tissues.

**ESR (erythrocyte sedimentation rate)** the rate at which red blood cells (erythrocytes) settle out of suspension in blood plasma, measured under standardized conditions. The ESR increases if the level of certain proteins in the plasma rises, as in rheumatic diseases, chronic infections, and malignant disease, and thus provides a simple but valuable screening test for these conditions.

**essence** *n.* a solution consisting of an essential oil dissolved in alcohol.

**essential** *adj.* describing a disorder that is not apparently attributable to an outside cause; for example, essential \*hypertension.

**essential amino acid** an *\*amino acid* that is essential for normal growth and development but cannot be synthesized by the body. Essential amino acids are obtained from protein-rich foods in the diet, such as meat, fish, eggs, and dairy products. Adults require eight essential amino acids: leucine, isoleucine, valine, phenylalanine, threonine, methionine, tryptophan, and lysine. Children require an additional nine, as their body's requirement is greater than can be synthesised by it: tyrosine, glycine, cysteine, arginine, proline, histidine, glutamine, serine, and asparagine.

**essential fatty acids** two groups of polyunsaturated fatty acids (*see UNSATURATED FATTY ACID*) that are essential for health but cannot be synthesized by the body. **Alpha-linolenic acid (ALA)** is the precursor for the *\*omega-3 fatty acids*. Good sources include walnuts, almonds, pumpkin seeds, flax seeds, rapeseed, soya, and corn oil. ALA can be converted (although not very efficiently) into DHA and EPA (the omega-3 fatty acids found in oily fish). Arachidonic acid is not considered an essential fatty acid as it can normally be synthesized from ALA. **Linoleic acid** is the precursor for the n-6 (or omega-6) fatty acids. Good sources include vegetable oils, such as corn, safflower, soybean, sesame, sunflower, and walnuts. Both omega-3 and omega-6 acids should be consumed in the diet.

**essential oil** a volatile oil derived from an aromatic plant. Essential oils are used in various pharmaceutical preparations.

**esterase** *n.* an enzyme that catalyses the hydrolysis of esters into their constituent acids and alcohols. For example, fatty-acid esters are broken down to form fatty acids plus alcohol.

**ESWL** extracorporeal shock-wave lithotripsy. *See* **LITHOTRIPSY**.

**etanercept** *n.* a *\*cytokine inhibitor* that is used in the treatment of severe rheumatoid and psoriatic arthritis, severe ankylosing spondylitis, and severe psoriasis that have not responded to other treatments. Side-effects include nausea and vomiting, headache, and fever.

**ethambutol** *n.* a drug used in the treatment of tuberculosis, in conjunction with other drugs. It occasionally causes visual disturbances, which cease when the drug is withdrawn. Allergic rashes and digestive upsets may also occur.

**ethanol (ethyl alcohol)** *n.* *see* [ALCOHOL](#).

**ether** *n.* a volatile liquid formerly used as an anaesthetic administered by inhalation, but now replaced by safer and more efficient drugs. Ether irritates the respiratory tract and affects the circulation.

**ethical erosion** an empirically observed phenomenon whereby medical students and doctors become less morally sensitive and ethically aware due to increasing cynicism, the negative effects of health-care training and practice, and the desire to ‘fit in’ with others in the profession.

**ethics** *n.* **1.** the branch of philosophy concerned with the content of moral judgments (**normative ethics**) and their nature and meaning (**metaethics**). *See also* [CONSEQUENTIALISM](#); [KANTIAN ETHICS](#); [NARRATIVE ETHICS](#). **2.** the principles, values, virtues, or rules of conduct accepted within a particular profession or field of activity. *See* [BIOETHICS](#); [MEDICAL ETHICS](#).

**ethics committee** a group usually including lay people, medical and health-care professionals, and other experts set up to review health-care practice. There are two types of ethics committee. A **research ethics committee** reviews research that involves the use of human subjects. It is responsible for safeguarding the rights and welfare of patients by ensuring that they are adequately informed of the procedures involved in a research project (including the use of dummy or placebo treatments as controls), that the tests and/or therapies are relatively safe, and that no-one is pressurized into participating in research. There are legal as well as professional requirements to seek ethics committee approval, e.g. when carrying out clinical trials of drugs. The National Research Ethics Service (*see* [HEALTH RESEARCH AUTHORITY](#)) coordinates the ethical review and governance of research referring submissions to research ethics committees (RECs) throughout the UK. The second type of ethics committee is a **clinical ethics committee**, which provides a resource to health-care professionals about ethical issues in clinical practice. There is neither an obligation for trusts to have a clinical ethics committee nor for clinicians to refer cases to such committees where they exist, although clinical ethics committees are an increasing presence in the NHS.

**ethinylestradiol** *n.* a synthetic female sex hormone (*see* **OESTROGEN**) used mainly, in combination with a progestogen, in **\*oral contraceptives**. Alone, it is used for treating menopausal symptoms, hypogonadism, and menstrual disorders in women and advanced prostate cancer in men. *See also* **CYPROTERONE**.

**ethmoid bone** a bone in the floor of the cranium that contributes to the nasal cavity and orbits. The part of the ethmoid forming the roof of the nasal cavity – the **cribriform plate** – is pierced with many small holes through which the olfactory nerves pass. *See also* **NASAL CONCHA**; **SKULL**.

**ethnology** *n.* the study of the different human racial, cultural, and religious groups and their variations: a branch of anthropology that deals mainly with differences between groups and how these are reflected in people's behaviour and attitudes.

**ethosuximide** *n.* an **\*anticonvulsant** drug used mainly to control absence seizures. Side-effects such as drowsiness, depression, and digestive disturbances may occur but are usually temporary.

**etidronate (disodium etidronate)** *n.* *see* **BISPHOSPHONATES**.

**etiology** *n.* *see* **AETIOLOGY**.

**etoposide** *n.* a **\*cytotoxic drug** derived from an extract of the mandrake plant that interferes with DNA replication (*see* **TOPOISOMERASE INHIBITOR**). It is used mainly in the treatment of bronchial carcinoma, lymphomas, and testicular tumours. Side-effects include alopecia, nausea, and marrow suppression.

**etoricoxib** *n.* *see* **COX-2 INHIBITOR**.

**eu-** *prefix denoting* **1.** good, well, or easy. **2.** normal.

**eubacteria** *pl. n.* a very large group of bacteria with rigid cell walls and – typically – flagella for movement. The group comprises the so-called ‘true’ bacteria, excluding those, such as spirochaetes and mycoplasmas, with flexible cell walls.

**eucalyptol** *n.* a volatile oil that has a mild irritant effect on the mucous membranes of the mouth and digestive system. It is used to relieve catarrh. Large doses may cause nausea, vomiting, and diarrhoea.

**euchromatin** *n.* chromosome material (*see* **CHROMATIN**) that stains most deeply during mitosis and represents the major genes. *Compare* **HETEROCHROMATIN**.

**eugenics** *n.* the alleged ‘science’ concerned with the improvement of the human race by means of the principles of genetics, strongly associated with ideas of selective breeding, discrimination, and immoral regimes, such as the Nazis in 20th-century Germany. Interventions used in reproductive medicine, such as **\*preimplantation genetic diagnosis**, antenatal screening, diagnostic testing, and abortion, are regarded by some as potentially eugenic. —**eugenic** *adj.*

**euglycaemia** *n.* *see* **NORMOGLYCAEMIA**.

**euphoria** *n.* a state of optimism, cheerfulness, and wellbeing. A morbid degree of euphoria is characteristic of **\*mania** and **\*hypomania**. *See also* **ECSTASY**; **ELATION**.

**euplastic** *adj.* describing a tissue that heals quickly after injury.

**euploidy** *n.* the condition of cells, tissues, or organisms in which there is one complete set of chromosomes or a whole multiple of this set in each cell. *Compare* **ANEUPLOIDY**. —**euploid** *adj., n.*

**European Resuscitation Council** the supervisory body of **\*advanced life-support** courses in Europe, responsible for updating the content of the courses based on best evidence from all countries represented.

**Eustachian tube** the tube that connects the middle **\*ear** to the pharynx. It allows the pressure on the inner side of the eardrum to remain equal to the external pressure. [B. Eustachio (1520–74), Italian anatomist]

**euthanasia** *n.* literally ‘a good death’, normally understood as the act of deliberately taking life in order to relieve suffering. In **voluntary euthanasia** a person requests measures to be taken to end his or her life, usually by the direct administration of drugs (as opposed to being provided with drugs in

**\*assisted suicide**). Voluntary euthanasia is lawful in a number of European jurisdictions, e.g. the Netherlands, Belgium, and Luxembourg. **Involuntary** (or **compulsory**) **euthanasia** is where society or those acting on authority give instructions to end the lives of individuals, such as infants, who cannot express their wishes or have not given consent. *See also* **ARTIFICIAL NUTRITION AND HYDRATION**; **ASSISTED SUICIDE**; **DOCTRINE OF DOUBLE EFFECT**; **EXTRAORDINARY MEANS**.

**euthymia** *n.* a normal mood state, often referred to in **\*mental state examinations**. The term also refers to a neutral mood state in a person with bipolar affective disorder. —**euthymic** *adj.*

**euthyroid** *adj.* having a thyroid gland that functions normally. *Compare* **HYPERTHYROIDISM**; **HYPOTHYROIDISM**. —**euthyroidism** *n.*

**euthyroid sick syndrome (sick euthyroid syndrome)** a syndrome characterized by alteration in the thyroid function tests in which the level of triiodothyronine is markedly reduced, thyroxine is slightly reduced, and thyroid-stimulating hormone is reduced or normal. This syndrome is commonly seen in nonthyroidal illness, due to altered metabolism and transport of the thyroid hormones, but can be mistaken for secondary **\*hypothyroidism**.

**evacuator** *n.* a device for sucking fluid out of a cavity. In its simplest form it consists of a hollow rubber bulb that is attached, via a valve system, to a tube inserted into the cavity. Another valve leads to a discharge tube. Evacuators may be used to empty the bladder of unwanted material during such operations as the removal of a calculus or transurethral **\*prostatectomy**.

**evagination** *n.* the protrusion of a part or organ from a sheathlike covering or by eversion of its inner surface.

**EVAR** *see* **ENDOVASCULAR ANEURYSM REPAIR**.

**evening primrose oil** oil pressed from the seeds of the evening primrose plant (*Oenothera biennis*), which has been used medicinally for centuries. The oil is rich in the polyunsaturated fatty acid linoleic acid (*see* **ESSENTIAL FATTY ACID**) and also contains gamma-linolenic acid. The latter component is claimed by some to be the active ingredient of the oil but this is not

proven. Symptom relief has been reported for rheumatoid arthritis, breast pain, premenstrual syndrome, eczema, diabetic neuropathy, cancer, hypercholesterolaemia, and heart disease, although study results have been negative or mixed.

**eventration** *n.* **1.** protrusion of the intestines or omentum through the abdominal wall. **2.** abnormal elevation of part of the diaphragm due to congenital weakness (but without true herniation).

**eversion** *n.* a turning outward; in **eversion of the cervix** the edges of the cervix (neck) of the uterus turn outward.

**evidence-based medicine** utilizing therapies on the basis of clinical studies of their effectiveness, rather than instinct or personal experience.

**evisceration** *n.* **1.** (in surgery) the removal of the viscera. **2.** (in ophthalmology) an operation in which the contents of the eyeball are removed, the empty outer envelope (sclera) being left behind. *Compare* **ENUCLEATION**.

**EVL** *see* **ENDOVENOUS LASER TREATMENT**.

**Ewing's sarcoma** a malignant tumour of bone occurring in children and young adults. Distinguished from **\*osteosarcoma** by J. Ewing in 1921, it commonly arises in the femur but is liable to spread to other bones and to the lung. It usually presents with pain, often associated with fever and **\*leucocytosis**. The tumour is sensitive to radiotherapy, and systemic therapy with **\*cytotoxic drugs** has greatly improved its prognosis. [J. Ewing (1866–1943), US pathologist]

**EWS** *see* **EARLY WARNING SYSTEM**.

**ex- (exo-)** *prefix denoting outside or outer.*

**exanteride** *n. see* **GLP-1 RECEPTOR AGONISTS**.

**exanthem** *n.* a rash or eruption (usually maculopapular), such as that occurring in measles. **Exanthem subitum** is another name for **\*roseola** (infantum). —**exanthematous** *adj.*

**excavator** *n.* **1.** a spoon-shaped surgical instrument that is used to scrape out diseased tissue, usually for laboratory examination. **2.** a type of hand instrument with spoon ends used for removing decayed dentine from teeth. It may also be used as a *\*curette*.

**exchange transfusion** a technique for treating *\*haemolytic* disease in newborn infants. Using a syringe with a three-way tap, blood is withdrawn from the baby (via the umbilical vein), ejected, and replaced by an equal amount of donor blood compatible with the mother's blood, without detaching the syringe. By many repetitions of this exchange, red blood cells liable to be destroyed and bilirubin released from those already destroyed are removed, while keeping the baby's blood volume and number of red cells constant. Exchange transfusion can also be used in *\*sickle-cell disease*, as a temporary treatment during a crisis, or in neonatal jaundice.

**excimer laser** a form of ultraviolet laser that can remove very thin sheets of tissue. This can be used to alter the curvature of the corneal surface, for example to treat long- or short-sightedness (see *LASEK*; *LASIK*), or to remove diseased (e.g. calcified) tissue from the corneal surface. See *KERATECTOMY*.

**excipient** *n.* a substance that is combined with a drug in order to render it suitable for administration; for example in the form of pills. Excipients should have no pharmacological action themselves.

**excise** *vb.* to cut out tissue, an organ, or a tumour from the body. —**excision** *n.*

**excitation** *n.* (in neurophysiology) the triggering of a conducted impulse in the membrane of a muscle cell or nerve fibre. During excitation a polarized membrane becomes momentarily depolarized and an *\*action potential* is set up.

**exclusion diet** see *ELIMINATION DIET*.

**excoriation** *n.* the destruction and removal of the surface of the skin or the covering of an organ by scraping, the application of a chemical, or other means.

**excrecence** *n.* an abnormal outgrowth on the surface of the body, such as a wart.

**excreta** *n.* any waste material discharged from the body, especially faeces.

**excretion** *n.* the removal of the waste products of metabolism from the body, mainly through the action of the **\*kidneys**. Excretion also includes the loss of water, salts, and some urea through the sweat glands and carbon dioxide and water vapour from the lungs, and the term is also used to include the egestion of faeces.

**executive dysfunction** disruption of the cognitive processes that regulate, control, and manage other cognitive processes, leading to deficiencies in planning, abstract thinking, flexibility, and behavioural control. It can occur following damage to the frontal lobes following stroke, traumatic brain injury, and dementia.

**exemestane** *n.* *see* **AROMATASE INHIBITOR**.

**exenteration** *n.* (in ophthalmology) an operation in which all the contents of the eye socket (orbit) are removed, leaving only the bony walls intact. The bone is covered by a skin graft. This operation is sometimes necessary when there is a malignant tumour in the orbit.

**exercise** *n.* any activity resulting in physical exertion that is intended to maintain physical fitness, to condition the body, or to correct a physical deformity. Exercises may be done actively by the person or passively by a therapist. **Aerobic exercises** are intended to increase oxygen consumption (as in running) and to benefit the lungs and cardiovascular system, in contrast to **\*isometric exercises**. In **isotonic exercises**, the muscles contract and there is movement, but the force remains the same; this improves joint mobility and muscle strength.

**exflagellation** *n.* the formation and release of mature flagellated male sex cells (*see* **MICROGAMETE**) by the **\*microgametocytes** of the malarial parasite (*see* **PLASMODIUM**). The process, which is completed in 10–15 minutes, occurs after the microgametocytes have been transferred from a human to the stomach of a mosquito.

**exfoliation** *n.* **1.** flaking off of the upper layers of the skin. **2.** separation of a surface epithelium from the underlying tissue. **3.** the natural shedding of primary teeth due to the eruption of their permanent successors. — **exfoliative** *adj.*

**exhalation (expiration)** *n.* the act of breathing air from the lungs out through the mouth and nose. *See* **BREATHING**.

**exhibitionism** *n.* exposure of the genitals to another person, as a sexually deviant act. The word is often broadened to mean public flaunting of any quality of the individual.

**exo-** *prefix.* *see* **EX-**.

**exocoelom** *n.* *see* **EXTRAEMBRYONIC COELOM**.

**exocrine gland** a gland that discharges its secretion by means of a duct, which opens onto an epithelial surface. An exocrine gland may be **simple**, with a single unbranched duct, or **compound**, with branched ducts and multiple secretory sacs. The illustration shows some different types of these glands. Examples of exocrine glands are the sebaceous and sweat glands. *See also* **SECRETION**.

### Types of exocrine glands.

**exoenzyme** *n.* an **\*enzyme** that acts outside the cell that produced it. Examples of exoenzymes are the digestive enzymes.

**exoerythrocytic** *adj.* describing those stages in the life cycle of the malarial parasite (see **PLASMODIUM**) that develop in the cells of the liver. Each parasite (**\*sporozoite**) divides repeatedly to produce a schizont containing many merozoites.

**exogenous** *adj.* originating outside the body or part of the body: applied particularly to substances in the body that are derived from the diet rather than built up by the body's own processes of metabolism. *Compare* **ENDOGENOUS**.

**exomphalos (umbilical hernia)** *n.* a congenital defect in which the abdominal wall fails to close during fetal development and bowel, covered by peritoneum, herniates through the umbilical cord. Unlike **\*gastroschisis**, it is associated with other structural fetal abnormalities. It can be corrected by surgery.

**exopeptidase** *n.* an enzyme (e.g. **\*trypsin**) that takes part in the digestion of proteins by splitting off the terminal amino acids of a polypeptide chain. *Compare* ENDOPEPTIDASE. *See also* PEPTIDASE.

**exophoria** *n.* a tendency to squint in which the eye, when covered, tends to turn outwards. The eye always straightens on removal of the cover. *See also* HETEROPHORIA.

**exophthalmic goitre (Graves' disease)** *see* THYROTOXICOSIS.

**exophthalmometer (proptometer)** *n.* an instrument for measuring the distance from the edges of the bony orbits to the corneas to ascertain the degree of **\*exophthalmos** in Graves' disease (*see* THYROTOXICOSIS).

**exophthalmos** *n.* protrusion of the eyeballs in their sockets. This can result from injury or disease of the eyeball or socket but is most commonly associated with overactivity of the thyroid gland (*see* THYROTOXICOSIS).

**exophytic** *adj.* describing growth outwards from an epithelial surface. Exophytic growth is characteristic of benign epithelial tumours but carcinomas may also have an exophytic growth component. *Compare* ENDOPHYTIC.

**exosmosis** *n.* outward osmotic flow. *See also* OSMOSIS.

**exostosis** *n.* a benign outgrowth of bone with a cap of cartilage, arising from a bony surface. It is a stalklike **\*osteochondroma**. **Hereditary multiple exostoses (diaphyseal aclasia, familial osteochondroma)** is a hereditary (autosomal **\*dominant**) abnormality of cartilage and bone growth that results in the formation of multiple exostoses, most commonly at the ends of the long bones.

**exothermic** *adj.* describing a chemical reaction in which energy is released in the form of heat. *Compare* ENDOTHERMIC.

**exotic** *adj.* describing a disease occurring in a region of the world far from where it might be expected. Thus malaria and leishmaniasis are regarded as exotic when they are diagnosed in patients in Britain.

**exotoxin** *n.* a highly potent poison, often harmful to only a limited range of tissues, that is produced by a bacterial cell and secreted into its surrounding medium. It is generally unstable, being rendered inactive by heat, light, and chemicals. Exotoxins are produced by such bacteria as those causing *\*botulism*, *\*diphtheria*, and *\*tetanus*. Compare **ENDOTOXIN**.

**exotropia** *n.* divergent squint (*see* **STRABISMUS**).

**expectorant** *n.* a drug that enhances the expulsion of sputum from the air passages. *\*Mucolytic* expectorants act by decreasing the viscosity of the bronchial secretions so that they are easier to cough up. Drugs such as *\*ipecacuanha* and ammonium chloride are claimed to be **stimulant expectorants** in small quantities: they irritate the lining of the stomach, which is said to provide a stimulus for the reflex production of sputum by the glands in the bronchial mucous membrane. At higher doses they produce vomiting.

**expectoration** *n.* the act of spitting out material brought into the mouth by coughing.

**expiration** *n.* **1.** the act of breathing out air from the lungs: exhalation. **2.** dying.

**explant** **1.** *n.* live tissue transferred from the body (or any organism) to a suitable artificial medium for culture. The tissue grows in the artificial medium and can be studied for diagnostic or experimental purposes. Tumour growths are sometimes examined in this way. **2.** *n.* silicone rubber material sutured to the outside of the eyeball over a retinal tear or hole (*see* **PLOMBAGE**). The resulting indent allows the retina to reattach. **3.** *vb.* to transfer live tissue for culture outside the body. —**explantation** *n.*

**exploding head syndrome (EHS, episodic cranial sensory shock)** an auditory *\*hallucination*, characterized by the perception of a sudden loud noise in the head or ears, that is experienced during a transition between sleep stages. The cause is not currently known.

**exploitation** *n.* taking unfair advantage of another's misfortune, weakness, or *\*vulnerability*. In medical ethics, the principle of *\*nonmaleficence* means that doctors have an active duty to avoid any exploitation of their patients. This is

usually held to require that professional boundaries are maintained and to prohibit personal or sexual relationships between professionals and their patients. Another example of potential exploitation is the practice of holding clinical trials and conducting research in developing countries when the treatments being tested are designed for sale and use in the West and will not be made available to those who acted as research participants or subjects.

**exploration** *n.* (in surgery) an investigative operation on a wound, tissue, or cavity. It may be undertaken to determine the cause of symptoms. — **exploratory** *adj.*

**exposure** *n.* (in behaviour therapy) a method of treating fears and phobias that involves confronting the individual with the situation he has been avoiding, so allowing the fears to wane by *\*habituation*. It can be achieved gradually by *\*desensitization* or *\*graded self-exposure* or suddenly by *\*flooding*.

**expressed emotion** a measure of the degree of warmth or hostility in a relationship between two people, assessed when one person is talking about the other. High levels of criticism and hostility from family members can worsen the prognosis of mentally ill patients, especially in *\*schizophrenia*; increased expressed emotion may be addressed with specialized *\*family therapy*.

**expulsive haemorrhage** sudden bleeding from the choroid, usually during a surgical procedure or trauma. This may force the ocular tissue out of the wound and is potentially one of the most devastating intraoperative complications of ocular surgery.

**exsanguination** *n.* **1.** depriving the body of blood; for example, as a result of an accident causing severe bleeding or – very rarely – through uncontrollable bleeding during a surgical operation. **2.** a technique for providing a bloodless field to facilitate delicate or haemorrhagic operative procedures. **3.** the removal of blood from a part (usually a limb) prior to stopping the inflow of blood (by tourniquet). — **exsanguinate** *vb.*

**exsiccation** *n.* drying up, as may occur in tissues deprived of an adequate supply of water during dehydration or starvation.

**exstrophy** *n.* a severe congenital abnormality in which the bladder fails to close during development: the baby is born with an absent lower abdominal wall and the internal surface of the posterior bladder wall is exposed. It is associated with **\*epispadias**, total urinary incontinence, and undescended testes.

**exsufflation** *n.* the forcible removal of secretions from the air passages by some form of suction apparatus.

**extension** *n.* **1.** the act of extending or stretching, especially the muscular movement by which a limb is straightened. **2.** the application of **\*traction** to a fractured or dislocated limb in order to restore it to its normal position.

**extensor** *n.* any muscle that causes the straightening of a limb or other part.

**exteriorization** *n.* a surgical procedure in which an organ is brought from its normal site to the surface of the body. This may be done as a temporary or permanent measure; for example, the intestine may be brought to the surface of the abdomen (*see* **COLOSTOMY**). The process is also sometimes used in physiological experiments on animals.

**external beam radiotherapy** *see* **TELETHERAPY**.

**external fixator** an apparatus consisting of a rigid frame that connects pins passed through the skin into the bone above and below a fracture. This immobilizes the fracture, and is used particularly to treat some compound fractures. An external fixator is also used for **\*limb lengthening**.

**exteroceptor** *n.* a sensory nerve, ending in the skin or a mucous membrane, that is responsive to stimuli from outside the body. *See also* **CHEMORECEPTOR**; **RECEPTOR**.

**extirpation** *n.* the complete surgical removal of tissue, an organ, or a growth.

**extra-** *prefix denoting outside or beyond.*

**extra-articular** *adj.* not involving a joint. The term is commonly used to specify a fracture pattern or the position of a bone tumour. It is also used to describe nonarticular or systemic manifestations of severe rheumatoid arthritis; for example, inflammation of the eyes, lungs, and heart, skin nodules

and vasculitis, and nerve damage (neuropathy). *See also* [INTRA-ARTICULAR](#); [PERIARTICULAR](#).

**extracellular** *adj.* situated or occurring outside cells; for example, **extracellular fluid** is the fluid surrounding cells.

**extracorporeal** *adj.* situated or occurring outside the body. **Extracorporeal circulation** is the circulation of the blood outside the body, as through a [\\*heart-lung machine](#) or in [\\*haemodialysis](#).

**extracorporeal membrane oxygenation (ECMO)** a technique that is accepted as a rescue treatment for otherwise fatal respiratory failure in newborn babies or infants due to prematurity or overwhelming septicaemia (e.g. meningitis). It involves modified prolonged [\\*cardiopulmonary bypass](#) to support gas exchange, which allows the lungs to rest and recover. ECMO is only available in selected high-technology centres.

**extract** *n.* a preparation containing the pharmacologically active principles of a drug, made by evaporating a solution of the drug in water, alcohol, or ether.

**extraction** *n.* **1.** the surgical removal of a part of the body. Extraction of teeth is usually achieved by applying [\\*elevators](#) and extraction [\\*forceps](#) to the crown or root of the tooth to dislocate it from its socket. When this is not possible, for example because the tooth or root is deeply buried within the bone, extraction is performed surgically by removing bone and, where necessary, dividing the tooth. **2.** the act of pulling out a baby from the body of its mother during childbirth.

**extractor** *n.* an instrument used to pull out a natural part of the body, to remove a foreign object, or to assist delivery of a baby (*see* [VENTOUSE](#)).

**extradural** *adj.* *see* [EPIDURAL](#).

**extraembryonic coelom (exocoelom)** the cavity, lined with mesoderm, that surrounds the embryo from the earliest stages of development. It communicates temporarily with the coelomic cavity within the embryo (peritoneal cavity). Late in pregnancy it becomes almost entirely obliterated by the growth of the [\\*amnion](#), which fuses with the [\\*chorion](#).

**extraembryonic membranes** the membranous structures that surround the embryo and contribute to the placenta and umbilical cord. They include the *\*amnion*, *\*chorion*, *\*allantois*, and *\*yolk sac*. In humans the allantois is always very small and by the end of pregnancy the amnion and chorion have fused into a single membrane and the yolk sac has disappeared.

**extraordinary means** life-prolonging treatments that are not regarded as beneficial (i.e. they do nothing to promote recovery or relieve suffering) and that may even be burdensome to the patient. It has been argued that there is no moral obligation to prolong life and/or to impose greater suffering by extraordinary means. 'Extraordinary' does not mean unusual: treatments that are considered routine may be classed as extraordinary when they are no longer clinically effective or are considered *\*futile*. Another way to describe the appropriateness of such interventions is to talk of 'proportionate' and 'disproportionate' means. See **ARTIFICIAL NUTRITION AND HYDRATION**.

**extrapleural** *adj.* relating to the tissues of the chest wall outside the parietal *\*pleura*.

**extrapyramidal effects** symptoms caused by a reduction of dopamine activity in the extrapyramidal system due to the adverse effects of *\*dopamine* receptor antagonists, notably phenothiazine *\*antipsychotic* drugs. These effects include *\*parkinsonism*, *\*akathisia*, and *\*dyskinesia*.

**extrapyramidal system** the system of nerve tracts and pathways connecting the cerebral cortex, basal ganglia, thalamus, cerebellum, reticular formation, and spinal neurons in complex circuits not included in the *\*pyramidal system*. The extrapyramidal system is mainly concerned with the regulation of stereotyped reflex muscular movements.

**extrasystole** *n.* see **ECTOPIC BEAT**.

**extrauterine** *adj.* outside the uterus.

**extravasation** *n.* the leakage and spread of blood or fluid from vessels into the surrounding tissues, which follows injury, burns, inflammation, and allergy.

**extraversion** *n.* see **EXTROVERSION**.

**extrinsic muscle** a muscle, such as any of those controlling movements of the eyeball, that has its origin some distance from the part it acts on. *See also* **EYE**.

**extroversion** *n.* **1.** (**extraversion**) an enduring personality trait characterized by interest in the outside world rather than the self. People high in extroversion (**extroverts**), as measured by questionnaires and tests, are gregarious and outgoing, prefer to change activities frequently, and are not susceptible to permanent **\*conditioning**. Extroversion was first described by Carl Jung as a tendency to action rather than thought, to scientific rather than philosophical interests, and to emotional rather than intellectual reactions. Eysenck used it as one of the main personality traits in his widely used personality questionnaire. *Compare* **INTROVERSION**. **2.** a turning inside out of a hollow organ, such as the uterus (which sometimes occurs after childbirth).

**extrovert** *n.* *see* **EXTROVERSION**.

**extrusion** *n.* (in dentistry) **1.** the forced eruption of a tooth either by means of an orthodontic appliance or surgically; for example, to realign a tooth that has failed to erupt or has been accidentally forced into the jaw. **2.** the partial displacement of a tooth from its socket as a result of traumatic injury.

**exudation** *n.* the slow escape of liquid (called the **exudate**) that is rich in proteins and contains white cells through the walls of intact blood vessels, usually as a result of inflammation. Exudation is a normal part of the body's defence mechanisms.

**eye** *n.* the organ of sight: a three-layered roughly spherical structure specialized for receiving and responding to light. The outer fibrous coat consists of the sclera and the transparent cornea; the middle vascular layer comprises the choroid, ciliary body, and iris; and the inner sensory layer is the retina (see illustration).

**Extrinsic muscles of the left eye.**

Light enters the eye through the cornea, which refracts the light through the aqueous humour onto the lens. By adjustment of the shape of the lens (*see* [ACCOMMODATION](#)) light is focused through the vitreous humour onto the retina. In the retina light-sensitive cells (*see* [CONE](#); [ROD](#)) send nerve impulses to the brain via the optic nerve. The arrangement of the two eyes at the front of the head provides *\*binocular vision*. Each eye is contained in an *\*orbit*, and movement of the eye within the orbit is controlled by extrinsic eye muscles (see illustration).

**The eye (sagittal section).**

**eyeball** *n.* the body of the **\*eye**, which is roughly spherical, is bounded by the **\*sclera**, and lies in the **\*orbit**. It is closely associated with accessory structures – the eyelids, conjunctiva, and lacrimal (tear-producing) apparatus – and its movements are controlled by three pairs of extrinsic eye muscles (see illustration).

**eyebrow** *n.* the small fringe of hair on the bony ridge just above the eye. It helps to prevent moisture from running into the eye. Anatomical name: **supercilium**.

**eyelash** *n.* one of the long stiff hairs that form a row projecting outwards from the front edge of the upper and lower eyelids. The eyelashes help keep dust away from the eye. Anatomical name: **cilium**.

**eyelid** *n.* the protective covering of the eye. Each eye has two eyelids consisting of skin, muscle, connective tissue (**tarsus**), and sebaceous glands (**meibomian** or **tarsal glands**). Each eyelid is lined with membrane (**\*conjunctiva**) and fringed with eyelashes. Stimulation of the pain receptors in the cornea causes the eyelids to close in a reflex action. Inflammation of a meibomian gland can result in a **\*chalazion**. Anatomical names: **blepharon**, **palpebra**.

**eye movement desensitization and reprocessing therapy (EMDR)** a type of psychotherapy used for the treatment of significant anxiety or distress caused by traumatic events or in the context of **\*post-traumatic stress disorder**. The aim is to separate the emotional from the actual memory of the event in order to reduce the anxiety related to the memory.

**eyepiece** *n.* the lens or system of lenses of an optical instrument, such as a microscope, that is nearest to the eye of the examiner. It usually produces a magnified image of the previous image formed by the instrument. *Compare* **OBJECTIVE**.

**eyespot** *n.* a small light-sensitive area of pigment found in some protozoans and other lower organisms.

**eyestrain** *n.* a sense of fatigue brought on by use of the eyes for prolonged close work or in persons who have an uncorrected error of **\*refraction** or an imbalance of the muscles that move the eyes. Symptoms are usually aching or burning of the eyes, accompanied by headache and even general fatigue if the eyes are not rested. Medical name: **asthenopia**.

**Fabry disease (Anderson–Fabry disease)** an inherited disorder – an X-linked recessive condition (see **SEX-LINKED**) – characterized by deficiency of the enzyme  $\alpha$ -galactosidase. It causes accumulation of glycosphingolipid (see **CEREBROSIDE**) in the body, leading to prominent and progressive involvement of the skin (with the formation of **\*angiokeratomas**), heart, kidneys, and nervous system. The disease is treated with genetically engineered enzyme replacement therapy. [J. Fabry (1860–1930), German dermatologist]

**FACE (facial Afro-Caribbean eruption of childhood)** a rare skin condition seen in Afro-Caribbean children. Characterized by a papular eruption around the eyes, nose, and mouth, it is a benign and self-limiting condition that usually subsides within a few months to years.

**face-bow** *n.* (in dentistry) an instrument for transferring the jaw relationship of a patient to an **\*articulator** to allow reproduction of the lateral and protrusive movements of the lower jaw. Specifically, it transfers the relationship of the maxillary arch and temporomandibular joint.

**face-lift** *n.* plastic surgery designed to correct sagging facial tissues. Eyelid drooping can be corrected at the same procedure.

**facet** *n.* a small flat surface on a bone or tooth, especially a surface of articulation.

**facial nerve** the seventh **\*cranial nerve** (VII): a mixed sensory and motor nerve that supplies the muscles of facial expression, the taste buds of the front part of the tongue, the sublingual salivary glands, and the lacrimal glands. A small branch to the middle ear regulates the tension on the ear ossicles.

**facial paralysis** paralysis of the facial nerve, causing weakness and loss of function of the muscles it serves. It occurs in **\*Bell's palsy**. The commonest cause is infection with the herpes simplex virus.

**-facient** *suffix denoting* causing or making. Example: **abortifacient** (causing abortion).

**facies** *n.* **1.** facial expression, often a guide to a patient's state of health as well as emotions. The typical facies seen in a patient with enlarged adenoids is a vacant look, with the mouth drooping open. A **Hippocratic facies** is the sallow face, sagging and with listless staring eyes, that indicates approaching death. **2.** (in anatomy) a specified surface of a bone or other body part.

**facilitation** *n.* **1.** (in neurology) the phenomenon that occurs when a neuron receives, through a number of different synapses, impulses that are not powerful enough individually to start an **\*action potential** but whose combined activity brings about some **\*depolarization** of the membrane. In this facilitated state any small additional depolarization will suffice to trigger off an impulse in the cell. **2.** (in education and group therapy) the process of running, leading, or controlling a group discussion.

**facio-** *combining form denoting* the face. Examples: **faciobrachial** (relating to the face and arm); **faciolingual** (relating to the face and tongue); **facioplegia** (paralysis of).

**factitious** *adj.* produced artificially, either deliberately or by accident, and therefore not to be taken into account when the results of an experiment are considered or a diagnosis is being made. In ICD-11 **factitious disorder** is one in which a person makes up physical or psychological symptoms to gain benefits, sympathy, and attention (*see* **MUNCHAUSEN'S SYNDROME**).

**factor** *n.* (in biochemistry) a substance that is essential to a physiological process, often a substance the nature of which is unknown. *See also* **COAGULATION FACTORS**; **GROWTH FACTOR**.

**Factor V Leiden** an inherited mutation in the gene coding for coagulation Factor V, which results in an increased susceptibility to develop venous **\*thrombosis**.

**Factor VIII (antihæmophilic factor)** a \*coagulation factor normally present in blood. Deficiency of the factor, which is inherited by males from their mothers, results in \*haemophilia A. *See also* VON WILLEBRAND'S DISEASE.

**Factor IX (Christmas factor)** a \*coagulation factor normally present in blood. Deficiency of the factor results in \*haemophilia B.

**Factor XI** a \*coagulation factor normally present in blood. Deficiency of the factor is inherited, but rarely causes spontaneous bleeding. However, bleeding does occur after surgery or trauma to the blood vessels.

**facultative** *adj.* describing an organism that is not restricted to one way of life. A **facultative parasite** can live either as a parasite or, in different conditions, as a nonparasite able to survive without a host. *Compare* OBLIGATE.

**Faculty of Public Health (FPH)** a joint faculty of the three Royal Colleges of Physicians of the United Kingdom and the standard setting body for specialists in public health in the UK. It aims to promote public health, develop the public health workforce, and act as an authoritative body offering consultation and advocacy on matters concerning public health. It assesses public health trainees and makes recommendations for inclusion on the GMC specialist register and UK voluntary register for public health professionals.

<https://www.fph.org.uk/FPH>

- The FPH website

**FAD (flavin adenine dinucleotide)** a \*coenzyme, derived from riboflavin, that takes part in many important oxidation-reduction reactions. It consists of two phosphate groups, adenine, and ribose.

**faecal calprotectin** *see* CALPROTECTIN.

**faecal impaction** *see* CONSTIPATION; IMPACTED.

**faecal incontinence** *see* INCONTINENCE.

**faecalith (faecolith, coprolith)** *n.* a hard mass of faeces within the colon, vermiform appendix, or rectum, due to chronic constipation: a cause of inflammation.

**faecal occult blood test (FOBT)** a noninvasive test used to identify microscopic blood (*see* **OCCULT**) in faeces. It is widely used as a screening test for colorectal cancer.

**faecal pancreatic elastase** *see* **ELASTASE**.

**faeces** *n.* the waste material that is eliminated through the anus. It is formed in the **\*colon** and consists of a solid or semisolid mass of undigested food remains (chiefly cellulose) mixed with **\*bile pigments** (which are responsible for the colour), bacteria, various secretions (e.g. mucus), and some water. *See* **Appendix 4**. —**faecal** *adj.*

**Fahrenheit temperature** temperature expressed on a scale in which the melting point of ice is assigned a temperature of 32° and the boiling point of water a temperature of 212°. For most medical purposes the Celsius (centigrade) scale has replaced the Fahrenheit scale. The formula for converting from Fahrenheit (F) to Celsius (C) is:  $C = 5/9(F - 32)$ . *See also* **CELSIUS TEMPERATURE**. [G. D. Fahrenheit (1686–1736), German physicist]

**failure to thrive (FTT)** failure of an infant to grow satisfactorily compared with the average for that community. It is detected by regular measurements and plotting on **\*centile charts**. It can be the first indication of a serious underlying condition, such as kidney or heart disease or malabsorption, or it may result from problems at home, particularly **\*nonaccidental injury**.

**fainting** *n.* *see* **SYNCOPE**.

**fairness** *n.* *see* **EQUALITY; JUSTICE**.

**falciform ligament** a fold of peritoneum separating the right and left lobes of the liver and attaching it to the diaphragm and the anterior abdominal wall as far as the umbilicus.

**Fallopian tube (oviduct, uterine tube)** either of a pair of tubes that conduct ova (egg cells) from the ovary to the uterus (*see* **REPRODUCTIVE SYSTEM**).

The ovarian end opens into the abdominal cavity via a funnel-shaped structure with finger-like projections (**fimbriae**) surrounding the opening. Movements of the fimbriae at ovulation assist in directing the ovum to the Fallopian tube. The ovum is fertilized near the ovarian end of the tube. [G. Fallopius (1523–63), Italian anatomist]

**Fallopian tube recanalization (FTR)** an **\*interventional radiology** technique to open up blocked Fallopian tubes as a treatment for infertility. This usually follows a **\*hysterosalpingogram**.

**falloscope** *n.* a narrow flexible fiberoptic **\*endoscope** used to view the inner lining of the Fallopian tubes (*see* **FALLOSCOPY**).

**falloscopy** *n.* observation of the interior of a Fallopian tube using a **\*falloscope** introduced via a hysteroscope (*see* **HYSTEROSCOPY**).

**Falot's tetralogy** *see* **TETRALOGY OF FALLOT**.

**false negative** a result of a diagnostic test or procedure that wrongly indicates the absence of a disease or other condition. *See* **SENSITIVITY**.

**false positive** a result of a diagnostic test or procedure that wrongly indicates the presence of a disease or other condition. *See* **SENSITIVITY**.

**false pregnancy** *see* **PSEUDOCYESIS**.

**false rib** *see* **RIB**.

**falx (falx cerebri)** *n.* (*pl.* **falces**) a sickle-shaped fold of the **\*dura** mater that dips inwards from the skull in the midline, between the cerebral hemispheres.

**familial** *adj.* describing a condition or character that is found in some families but not in others. It is often inherited.

**familial adenomatous polyposis (FAP)** *see* **POLYPOSIS**.

**familial hypercholesterolaemia** *see* **HYPERCHOLESTEROLAEMIA**.

**familial mixed hyperlipidaemia** *see* **HYPERLIPIDAEMIA**.

**family doctor** *see* **GENERAL PRACTITIONER**.

**family planning** **1.** the use of \*[contraception](#) to limit or space out the numbers of children born to a couple. **2.** provision of contraceptive methods within a community or nation. *See also* [GENETIC COUNSELLING](#).

**family practitioner** *see* [GENERAL PRACTITIONER](#).

**family therapy** a form of \*[psychotherapy](#) based on the belief that psychological problems are the products of abnormalities in communication between family members. All family members are therefore seen together, when possible, in order to clarify and modify the ways they relate together (*see* [GENOGRAM](#); [PARADOX](#)).

**famotidine** *n.* an H<sub>2</sub>-receptor antagonist (*see* [ANTI HISTAMINE](#)) used for the treatment of gastric and duodenal ulcers and reflux oesophagitis. Side-effects are headache, diarrhoea, and dizziness.

**Fanconi's anaemia** an autosomal \*[recessive](#) disorder characterized by severe aplastic \*[anaemia](#) (failure of the bone marrow to produce blood cells, either red or white) and an increased predisposition to malignancy. It also causes mental retardation, poor growth, skeletal abnormalities, and kidneys of an unusual shape or in an unusual position. The condition is due to a defect in one of a group of genes known as Fanconi's anaemia (*FA*) genes. Children are usually diagnosed between five and ten years of age. The only treatment available is \*[haemopoietic stem cell](#) transplantation; without this, most affected individuals die by the age of 30 from bone marrow failure or leukaemia. [G. Fanconi (1892–1979), Swiss paediatrician]

**Fanconi syndrome** a disorder of the proximal kidney tubules, which may be inherited or acquired and is most common in children. It is characterized by the urinary excretion of large amounts of amino acids, glucose, and phosphates (though blood levels of these substances are normal). Symptoms may include osteomalacia, rickets, muscle weakness, and \*[cystinosis](#). Treatment is directed to the cause. [G. Fanconi]

**Fansidar** *n.* *see* [PYRIMETHAMINE](#).

**fantasy** *n.* a complex sequence of imagination in which several imaginary elements are woven together into a story. An excessive preoccupation with one's fantasies may be symptomatic of a difficulty in coping with reality or

part of a narcissistic personality disorder (*see* [NARCISSISM](#)). In psychoanalytic psychology, **unconscious fantasies** are believed to control behaviour, and psychological symptoms may be symbols of or defences against such fantasies (*see* [SYMBOLISM](#)).

**FARA** (cryptogenic) *fibrosing alveolitis* associated with *rheumatoid arthritis*. *See* [ALVEOLITIS](#).

**farad** *n.* the [\\*SI unit](#) of capacitance, equal to the capacitance of a capacitor between the plates of which a potential difference of 1 volt appears when it is charged with 1 coulomb of electricity. Symbol: F.

**faradism** *n.* the use of induced rapidly alternating electric currents to stimulate nerve and muscle activity. *See also* [ELECTROTHERAPY](#).

**farcy** *n.* *see* [GLANDERS](#).

**farmer's lung** an occupational lung disease caused by allergy to fungal spores that grow in inadequately dried stored hay, straw, or grain, which then becomes mouldy. It is an allergic [\\*alveolitis](#), such as also results from sensitivity to many other allergens. An acute reversible form can develop a few hours after exposure; a chronic form, with the gradual development of irreversible breathlessness, occurs with or without preceding acute attacks. Avoidance of the allergen is the main principle of treatment, but most farmers are able to continue to farm by taking appropriate precautions.

**fascia** *n.* (*pl.* **fasciae**) connective tissue forming layers of variable thickness in all regions of the body. It is divided into **superficial fascia**, found immediately beneath the skin, and **deep fascia**, which envelops organs and tissues. Deep fascia includes the sheets of fibrous tissue that enclose muscles and muscle groups and separate them into layers.

**fasciculation** *n.* brief spontaneous contraction of a few muscle fibres, which is seen as a flicker of movement under the skin. It is most often associated with disease of the lower motor neurons (e.g. [\\*motor neuron disease](#)). Fasciculation may be seen in the calf muscles of normal individuals, especially after exercise.

**fasciculus (fascicle)** *n.* a bundle, e.g. of nerve or muscle fibres.

**fasciitis** *n.* inflammation of **\*fascia**. It may result from bacterial infection or from a rheumatic disease, such as **\*reactive arthritis** or ankylosing **\*spondylitis**. *See also* NECROTIZING FASCIITIS; PLANTAR FASCIITIS.

**Fasciola** *n.* a genus of **\*flukes**. *F. hepatica*, the liver fluke, normally lives as a parasite of sheep and other herbivorous animals but sometimes infects humans (*see* FASCIOLIASIS).

**fascioliasis** *n.* an infestation of the bile ducts and liver with the liver fluke, *Fasciola hepatica*. Humans acquire the infection through eating wild watercress on which the larval stages of the parasite are present. The symptoms include fever, dyspepsia, vomiting, loss of appetite, abdominal pain, and coughing; the liver may also be extensively damaged (causing **liver rot**). Anthelmintics are used in the treatment of fascioliasis.

**fasciolopsiasis** *n.* a disease, common in the Far East, caused by the fluke **\*Fasciolopsis buski** in the small intestine. At the site of attachment of the adult flukes in the intestine there may be inflammation with some ulceration and bleeding. Symptoms include diarrhoea, and in heavy infections the patient may experience loss of appetite, vomiting, and (later) swelling of the face, abdomen, and legs. Death may follow in cases of severe ill health and malnutrition. The flukes can be removed with an anthelmintic (such as praziquantel).

**Fasciolopsis** *n.* a genus of large parasitic flukes widely distributed throughout eastern Asia and especially common in China. The adults of *F. buski*, the giant intestinal fluke, live in the human small intestine. Humans become infected with the fluke on eating uncooked water chestnuts contaminated with fluke larvae and the resulting symptoms can be serious (*see* FASCIOLOPSIASIS).

**fasciotomy** *n.* a procedure used to relieve or prevent **\*compartment syndrome** by incising the fascial compartment containing the muscle(s) involved and the overlying skin. The wound is then allowed to close by direct primary closure, secondary intention (*see also* DELAYED SUTURE), or placement of a skin graft over the defect once the muscle swelling has resolved.

**FASS** (cryptogenic) *fibrosing alveolitis* associated with systemic sclerosis.  
*See* **ALVEOLITIS**.

**fastigium** *n.* **1.** the period during which a disease or fever is fully developed.  
**2.** the highest point in the roof of the fourth ventricle of the brain.

**fat** *n.* a substance that contains one or more **\*fatty acids** in the form of **\*triglycerides** and is the principal form in which energy is stored by the body (in **\*adipose tissue**). It also serves as an insulating material beneath the skin (in the subcutaneous tissue) and around certain organs (including the kidneys). Fat is one of the three main constituents of food (*see also* **CARBOHYDRATE**; **PROTEIN**); it is necessary in the diet to provide an adequate supply of **\*essential fatty acids** and for the efficient absorption of fat-soluble vitamins from the intestine. Excessive deposition of fat in the body leads to **\*obesity**. *See also* **BROWN FAT**; **LIPID**.

**fatal familial insomnia** an autosomal **\*dominant** disorder due to a mutation in the gene for the **\*prion** protein (PrP): it is an example of a **\*spongiform encephalopathy**. Patients present with intractable progressive insomnia, disturbances of the autonomic nervous system, and eventually dementia.

**fatigue** *n.* **1.** mental or physical tiredness, following prolonged or intense activity. Muscle fatigue may be due to the waste products of metabolism accumulating in the muscles faster than they can be removed by the venous blood. Incorrect or inadequate food intake or disease may predispose a person to fatigue. **2.** the inability of an organism, an organ, or a tissue to give a normal response to a stimulus until a certain recovery period has elapsed.

**fatigue fracture** *see* **STRESS FRACTURE**.

**fatty acid** an organic acid with a long straight hydrocarbon chain and an even number of carbon atoms. Fatty acids are the fundamental constituents of many important lipids, including **\*triglycerides**. Some fatty acids can be synthesized by the body; others, the **\*essential fatty acids**, must be obtained from the diet. Examples of fatty acids are **palmitic acid**, **oleic acid**, and **stearic acid**. *See also* **FAT**; **SATURATED FATTY ACID**; **UNSATURATED FATTY ACID**.

**fatty degeneration** deterioration in the health of a tissue due to the deposition of abnormally large amounts of fat in its cells. The accumulation of fat in the liver and heart may seriously impair their functioning. The deposition of fat may be linked with incorrect diet, excessive alcohol consumption, or a shortage of oxygen in the tissues caused by poor circulation or a deficiency of haemoglobin.

**fatty liver** *see* **NONALCOHOLIC FATTY LIVER DISEASE; ACUTE FATTY LIVER OF PREGNANCY.**

**fauces** *n.* the opening leading from the mouth into the pharynx. It is surrounded by the **glossopalatine arch** (which forms the anterior pillars of the fauces) and the **pharyngopalatine arch** (the posterior pillars).

**favism** *n.* an inherited defect in the enzyme glucose-6-phosphate dehydrogenase causing the red blood cells to become sensitive to a chemical in fava beans (broad beans). Eating these beans results in destruction of red blood cells (haemolysis), which may lead to severe anaemia, requiring blood transfusion. Favism occurs most commonly in the Mediterranean and Middle East. *See also* **GLUCOSE-6-PHOSPHATE DEHYDROGENASE DEFICIENCY.**

**FCE** *see* **FINISHED CONSULTANT EPISODE.**

**FDA** *see* **FOOD AND DRUG ADMINISTRATION.**

**FDG** *see* **FLUORODEOXYGLUCOSE.**

**fear** *n.* an emotional state evoked by the threat of danger and usually characterized by unpleasant subjective experiences as well as physiological and behavioural changes. Fear is often distinguished from **\*anxiety** in having a specific object. Associated physiological changes can include increases in heart rate, blood pressure, sweating, etc. Behavioural changes can include an avoidance of fear-producing objects or situations and may be extremely disabling. Specific disabling fears are known as **\*phobias**. **\*Beta blockers** relieve the physiological manifestations of fear and are useful in the treatment of short-term fears, such as the fear of hearing the results of an examination. **\*Behaviour therapy** or **\*cognitive behavioural therapy** are treatments for disabling and persistent fears.

**febricula** *n.* a fever of low intensity or short duration.

**febrifuge** *n.* a treatment or drug that reduces or prevents fever. *See* ANTIPYRETIC.

**febrile** *adj.* relating to or affected with fever.

**febrile convulsion (febrile seizure)** an epileptic-type seizure associated with a fever. Such seizures affect up to 4% of children, usually aged between six months and six years, and generally last less than ten minutes. Seizures do not lead to mental retardation or cerebral palsy, although the risk of developing *\*epilepsy* is around 2%, especially when other risk factors, such as family history, are present. Seizures may be recurrent, but the risk of this can be minimized by attempts to reduce the fever. The underlying infection is usually viral, but more serious conditions, such as meningitis, should be excluded.

**febuxostat** *n.* a drug used for the prevention of acute attacks of gout. It acts by inhibiting the enzyme xanthine oxidase, thereby reducing the level of uric acid in the blood and tissues. Side-effects include gout flares, nausea, diarrhoea, rash, and liver function abnormalities.

**feedback** *n.* (in physiology) the coupling of the output of a process to the input. Feedback mechanisms are important in regulating many physiological processes; for example, the production of hormones and neurotransmitters. In **negative feedback**, a rise in the output of a substance will inhibit a further increase in its production, either directly or indirectly (*see* **NEGATIVE FEEDBACK LOOP**). In **positive feedback**, a rise in the output of a substance is associated with an increase in the output of another substance, either directly or indirectly.

**Fehling's test** a test for detecting the presence of sugar in urine, which has now been replaced by better and easier methods. [H. von Fehling (1812–85), German chemist]

**Felty's syndrome** a disorder characterized by enlargement of the spleen (*\*splenomegaly*), rheumatoid arthritis, and a decrease in the number of neutrophils in the blood (*see* **NEUTROPENIA**). [A. R. Felty (1895–1964), US physician]

**female genital cosmetic surgery (FGCS)** surgery to alter the size or shape of the *\*vulva* and/or vagina when these are a cause of significant distress or sexual dysfunction. FGCS includes **labioplasty** (reduction or alteration of the labia), **clitoral hood reduction** (excision of excess skin in the fold surrounding the clitoris), and **hymenoplasty** (partial or complete reconstruction of the hymen).

**female genital mutilation (female circumcision)** removal of the clitoris, labia minora, and labia majora for cultural reasons. The extent of excision varies between countries and ethnic groups. The anatomically least damaging form is **clitoridectomy** (removal of the clitoris); the next form entails excision of the prepuce, clitoris, and all or part of the labia minora. The most extensive form, **infibulation**, involves excision of clitoris, labia minora, and labia majora. The vulval lips are sutured together and a piece of wood or reed is inserted to preserve a small passage for urine and menstrual fluid. In the majority of women who are circumcised, *\*episiotomy*, often extensive, is required to allow delivery of a child. FGM removes most of the possibility of sexual pleasure for a woman, is unethical, and in children is a form of *\*child abuse*: it is prohibited under the Female Genital Mutilation Act 2003.

**Femara** *n.* see **AROMATASE INHIBITOR**.

**feminist ethics** an approach that is critical of the prevailing focus and methods of *\*medical ethics*. In particular, it is argued that contemporary bioethics has replicated oppressive social structures, privilege, and power relationships at the expense of the marginalized. Moral problems are seen as determined from the social context in which they arise and narrative, care, and *\*empowerment* are usually integral to feminist analyses of ethical dilemmas.

**feminization** *n.* the development of female secondary sexual characteristics (enlargement of the breasts, loss of facial hair, and fat beneath the skin) in the male, either as a result of an endocrine disorder or of hormone therapy.

**femoral** *adj.* of or relating to the thigh or to the femur.

**femoral artery** an artery arising from the external iliac artery at the inguinal ligament. It is situated superficially, running down the front medial aspect of

the thigh. Two-thirds of the way down it passes into the back of the thigh, continuing downward behind the knee as the **popliteal artery**.

**femoral epiphysis** *see* **FEMUR**.

**femoral nerve** the nerve that supplies the quadriceps muscle at the front of the thigh and receives sensation from the front and inner sides of the thigh. It arises from the second, third, and fourth lumbar nerves.

**femoral triangle (Scarpa's triangle)** a triangular depression on the inner side of the thigh bounded by the sartorius and adductor longus muscles and the inguinal ligament. The pulse can be felt here as the femoral artery lies over the depression.

**femtosecond laser** a laser that emits optical pulses with a duration of **femtoseconds** (fs;  $1 \text{ fs} = 10^{-15} \text{ s}$ ), allowing micrometer-level accuracy and needle- or blade-free surgery. It has the potential to carry out lens extraction or cataract surgery through a pin-prick incision.

**femur (thigh bone)** *n.* a long bone between the hip and the knee (see illustration overleaf). The head of the femur articulates with the acetabulum of the **\*hip bone**. The **greater** and **lesser trochanters** are protuberances on which the gluteus and psoas major muscles, respectively, are inserted. The **lateral** and **medial condyles** articulate with the **\*tibia**, and the **trochlear groove** accommodates the kneecap (patella).

**The femur (front view).**

The narrowed end of the femur (**femoral neck**), which carries the head, is the commonest site of fracture of the leg in elderly women. Partial dislocation of the **femoral epiphysis**, the growth area of the upper end of the bone, leads to deformity of the head of the femur and premature degeneration of the hip joint.

**fenestra** *n.* (in anatomy) an opening resembling a window. The **fenestra ovalis** (**fenestra vestibuli**) – the oval window – is the opening between the middle *\*ear* and the vestibule of the inner ear. It is closed by a membrane to which the stapes is attached. The **fenestra rotunda** (**fenestra cochleae**) – the round window – is the opening between the scala tympani of the cochlea

and the middle ear. Sound vibrations leave the cochlea through the fenestra rotunda which, like the fenestra ovalis, is closed by a membrane.

**fenestration** *n.* **1.** (in dentistry) a ‘window’ of bone loss on the facial or lingual aspect of a tooth that places the exposed root surface directly in contact with the gum or the alveolar mucosa. **2.** a surgical operation in which a new opening is formed in the bony *\*labyrinth* of the inner ear as part of the treatment of deafness due to *\*otosclerosis*. It is rarely performed today, having been superseded by *\*stapedectomy*.

**fenofibrate** *n.* *see* **FIBRATES**.

**fenoprofen** *n.* an *\*analgesic* drug that also reduces inflammation (*see* **NSAID**) and is used to treat arthritic conditions and pain. It may cause digestive upsets, drowsiness, dizziness, sweating, and headache.

**fentanyl** *n.* a potent opioid analgesic (*see* **OPIATE**) used for the relief of severe pain (for example in cancer patients already receiving other opioids) and for pain relief during surgery.

**fermentation** *n.* the biochemical process by which organic substances, particularly carbohydrate compounds, are decomposed by the action of enzymes to provide chemical energy. An example is **alcoholic fermentation**, in which enzymes in yeast decompose sugar to form ethyl alcohol and carbon dioxide.

**ferning** *n.* the appearance of a fernlike pattern in a dried specimen of cervical mucus, an indication of the presence of oestrogen, usually seen at the midpoint of the menstrual cycle. It can be helpful in the determination of ovulation. The same phenomenon occurs with premature rupture of the membranes (*see* **FIBRONECTIN**).

**ferri- (ferro-)** *combining form denoting iron.*

**ferric sulphate** an iron salt used in solution to stop bleeding, for example in pulpotomy of primary teeth.

**ferritin** *n.* an iron-protein complex that is one of the forms in which iron is stored in the tissues.

**ferrous sulphate** an **\*iron** salt administered by mouth to treat or prevent iron-deficiency anaemia. There are few serious side-effects; stomach upsets and diarrhoea may be prevented by taking the drug with meals. Similar preparations used to treat anaemia include **ferrous fumarate** and **ferrous gluconate**.

**ferrule** *n.* (in dentistry) a continuous (360°) band used to encircle the remaining structure of a tooth before a crown is fitted. This helps to protect the tooth from fracture (the **ferrule effect**).

**fertility rate** the number of live births occurring in a year per 1000 women of child-bearing age (usually 15 to 44 years). A less reliable measure of fertility can be obtained from the **live birth rate** (the number of live births per 1000 of the population) or the **natural increase** (the excess of live births over deaths). More rarely quoted are the **gross reproduction rate** (the rate at which the child-bearing female population is reproducing itself) and the **net reproduction rate**, which takes into account female mortality before the age of reproduction.

**fertilization** *n.* the fusion of a spermatozoon and an ovum. Rapid changes in the membrane of the ovum prevent other spermatozoa from penetrating. Penetration stimulates the completion of meiosis and the formation of the second polar body. Once the male and female pronuclei have fused the zygote starts to divide by cleavage.

**FESS** functional **\*endoscopic sinus surgery**.

**festination** *n.* short tottering steps that become more rapid, due to a loss of postural reflexes and stooped posture. Festination is found in patients with **\*parkinsonism**.

**fetal alcohol spectrum disorder (FASD, fetal alcohol syndrome, FAS)** a condition of newborn babies that results from the toxic effects on the fetus of maternal alcohol abuse. Babies have a low birth weight and growth is retarded. They have a small head (**\*microcephaly**), low-set ears, eye, nose, lip, and nail abnormalities, and disturbances of behaviour and intellect. The greater the alcohol abuse, the more severe the fetal manifestations.

**fetal blood sampling** withdrawal of a sample of fetal blood, either from the umbilical vein during the antenatal period (*see* **CORDOCENTESIS**) or from a

vein in the presenting part (usually the fetal scalp) during labour. The latter procedure is used to detect **\*hypoxia**, by measuring the fetal pH and degree of **\*acidosis**. The normal pH of fetal blood is 7.35 (range 7.45–7.25). The lower the pH, the more likely is the fetus to be suffering from hypoxia and acidosis, indicating an urgent need to deliver the baby.

**fetal growth chart** a graph, customized to a pregnant woman's height, weight, and other factors, that plots **\*fundal height** and estimated fetal weight on ultrasound against weeks of gestation. The graph, which shows centile lines (see **CENTILE CHART**), improves prediction of a baby who is **\*small for gestational age**.

**fetal growth restriction** see **INTRAUTERINE GROWTH RESTRICTION**.

**fetal implant (fetal graft)** the introduction of an ovum, fertilized in vitro and developed to the **\*blastocyst** stage, into the uterus of a postmenopausal woman in order that she may become pregnant. Before this procedure, the woman's uterus must be prepared, by hormone therapy, to receive and nurture the blastocyst. Hormone treatment is continued throughout the pregnancy.

**fetal scalp electrode** an electrical wire set into a sharp spiral metal tip and encased in a plastic sheath. It is attached to the fetal scalp for direct measurement of fetal heart rate by electrical activity.

**fetal transplant** a research method in which specific cells are taken from a normal fetus, with the informed consent of the mother following her request for termination of pregnancy, for transplantation into a person suffering from a specific disease. These fetal cells would take over the function of the specific diseased or damaged cells of the host. Examples are fetal brain cells transplanted into the affected part of the brain in a patient suffering from Parkinson's disease, and fetal pancreatic cells transplanted into the pancreas of a juvenile diabetic. Other diseases are being investigated experimentally with a view to using fetal transplants. Such procedures involve major ethical considerations.

**feticide** *n.* the destruction of a fetus in the uterus by injection of potassium chloride into the fetal heart to stop any pulsation and other signs of life before induced abortion and following premedication to the mother. This is

usually performed to achieve a late-stage termination of pregnancy (after 21 weeks), for example because of major abnormalities in the fetus.

**fetishism** *n.* sexual attraction to an inappropriate object (known as a **fetish**). This may be a part of the body (e.g. the foot or the hair), clothing (e.g. underwear or shoes), or other objects (e.g. leather handbags or rubber sheets). In all these cases the fetish has replaced the normal object of sexual love, in some cases to the point at which sexual relationships with another person are impossible or are possible only if the fetish is either present or fantasized. Treatment can involve **\*psychotherapy** or behaviour therapy using **\*aversion therapy** and masturbatory conditioning of desirable sexual behaviour.

**feto-** *combining form denoting a fetus.*

**fetor (foetor)** *n.* an unpleasant smell. **Fetor oris** is bad breath (**\*halitosis**), which is most commonly caused by poor oral hygiene but can also occur in patients with acute appendicitis or uraemia. **Fetor hepaticus** is bad breath with a sweet faecal odour, occurring in patients with severe liver disease.

**fetoscopy** *n.* direct visualization of a fetus by passing a special fiberoptic endoscope (a **fetoscope**) through the abdomen of a pregnant woman into the amniotic cavity. Its original use as a technique for visualizing fetal malformations and sampling fetal blood for diagnosis of blood disorders has been abandoned with advances in high-resolution fetal imaging. It is now used to facilitate minimally invasive surgery on the fetus and placenta, either under local anaesthetic or by laparotomy on the mother; the fetoscope can be directed into place using **\*real-time imaging**. Fetoscopic laser ablation of placental vessels is now commonly used in cases of twin-to-twin transfusion.

**fetus (foetus)** *n.* a mammalian **\*embryo** during the later stages of development within the uterus. In human reproduction it refers to an unborn child from its eighth week of development. —**fetal** *adj.*

**fetus papyraceus** a twin fetus that has died in the uterus and become flattened and mummified.

**Feulgen reaction** a method of demonstrating the presence of DNA in cell nuclei. The tissue section under investigation is first hydrolysed with dilute hydrochloric acid and then treated with **\*Schiff's reagent**. A purple

coloration develops in the presence of DNA. [R. Feulgen (1884–1955), German chemist]

**FEV** *see* **FORCED EXPIRATORY VOLUME**.

**fever (pyrexia)** *n.* a rise in body temperature above the normal, i.e. above an oral temperature of 98.6°F (37°C) or a rectal temperature of 99°F (37.2°C). Fever is generally accompanied by shivering, headache, nausea, constipation, or diarrhoea. A rise in temperature above 105°F (40.5°C) may cause delirium and, in young children, **\*convulsions** too. Fevers are usually caused by bacterial or viral infections and can accompany any infectious illness, from the common cold to **\*malaria**. An **intermittent fever** is a periodic rise and fall in body temperature, often returning to normal during the day and reaching its peak at night, as in malaria. A **remittent fever** is one in which body temperature fluctuates but does not return to normal. *See also* **RELAPSING FEVER**.

**FGF23** fibroblast growth factor 23: a hormone that is central to phosphate homeostasis. It is synthesized by osteoblasts and osteoclasts in response to high phosphate intake, hyperphosphataemia, or an increase in serum **\*calcitriol** concentration. It inhibits phosphate reabsorption by the proximal tubule of the kidney and stimulates 24-hydroxylase, the enzyme that converts calcitriol and its precursor, 25-hydroxy vitamin D, into inactive metabolites. It may also have a negative effect on parathyroid hormone synthesis.

**fibr-** (**fibro-**) *combining form denoting* fibres or fibrous tissue.

**fibrates** *pl. n.* a class of drugs, chemically related to fibric acid, that are capable of reducing concentrations of triglycerides in the blood (*see* **HYPERTRIGLYCERIDAEMIA**); they may also reduce plasma **\*low-density lipoproteins** and they tend to raise the levels of the beneficial **\*high-density lipoproteins**. Fibrates are used for treating hyperlipidaemia; they include **\*bezafibrate**, **ciprofibrate**, **fenofibrate**, and **\*gemfibrozil**. Fibrates can have adverse effects on muscle (*see* **MYOSITIS**).

**fibre** *n.* **1.** (in anatomy) a threadlike structure, such as a muscle cell, a nerve fibre, or a collagen fibre. **2.** (in dietetics) *see* **DIETARY FIBRE**. —**fibrous** *adj.*

**fibre optics** the use of fibres for the transmission of light images. Synthetic fibres with special optical properties can be used in instruments to relay pictures of the inside of the body for direct observation or photography. *see* **FIBRESCOPE**. —**fibreoptic** *adj.*

**fibrescope** *n.* an **\*endoscope** that uses **\*fibre optics** for the transmission of images from the interior of the body. Fibrescopes have a great advantage over the older endoscopes as they are flexible and can be introduced into relatively inaccessible cavities of the body.

**fibril** *n.* a very small fibre or a constituent thread of a fibre (for example, a **\*myofibril** of a muscle fibre). —**fibrillar**, **fibrillary** *adj.*

**fibrillation** *n.* chaotic electrical and mechanical activity of a heart chamber, which results in loss of synchronous contraction. The affected part of the heart then ceases to pump blood.

Fibrillation may affect the atria or ventricles independently. In **atrial fibrillation** (a common type of **\*arrhythmia**), the chaotic electrical activity of the atria is conducted to the ventricles in a random manner resulting in a rapid and irregular pulse rate. The main causes are atherosclerosis, chronic rheumatic heart disease, and hypertensive heart disease. It may also complicate various other conditions, including chest infections and thyroid overactivity. The heart rate is controlled by the administration of **\*digoxin**; in some cases the heart rhythm can be restored to normal by **\*cardioversion**. Anticoagulant therapy reduces the risk of blood-clot formation, which could cause a stroke.

When **ventricular fibrillation** occurs the ventricles stop beating (*see* **CARDIAC ARREST**). It is most commonly the result of **\*myocardial infarction**.

**fibrin** *n.* the final product of the process of **\*blood coagulation**, produced by the action of the enzyme thrombin on a soluble precursor fibrinogen. The product thus formed (**fibrin monomer**) links up (polymerizes) with similar molecules to give a fibrous meshwork that forms the basis of a blood clot, which seals off the damaged blood vessel.

**fibrinogen** *n.* a substance (**\*coagulation** factor), present in blood plasma, that is acted upon by the enzyme thrombin to produce the insoluble protein fibrin

in the final stage of **\*blood coagulation**. The normal level of fibrinogen in plasma is 2–4 g/l (4–6 g/l during pregnancy).

**fibrinogenopenia** *n.* a former name for **\*hypofibrinogenaemia**.

**fibrinoid** *adj.* resembling the protein fibrin.

**fibrinolysin** *n.* *see* **PLASMIN**.

**fibrinolysis** *n.* the process by which blood clots are removed from the circulation, involving digestion of the insoluble protein **\*fibrin** by the enzyme **\*plasmin**. The latter exists in the plasma as an inactive precursor (plasminogen), which is activated in parallel with the **\*blood coagulation** process. Normally a balance is maintained between the processes of coagulation and fibrinolysis in the body; an abnormal increase in fibrinolysis leads to excessive bleeding.

**fibrinolytic** *adj.* describing a group of drugs that are capable of breaking down the protein fibrin (*see* **FIBRINOLYSIS**), which is the main constituent of blood clots, and are therefore used to disperse blood clots (thrombi) that have formed within the circulation, most notably after myocardial infarction. They include **\*streptokinase**, **\*urokinase**, **\*alteplase**, **reteplase**, and **tenecteplase**. Possible side-effects include bleeding at needle puncture sites, headache, backache, blood spots in the skin, and allergic reactions.

**fibroadenoma** *n.* *see* **ADENOMA**.

**fibroblast** *n.* a widely distributed cell in **\*connective tissue** that is responsible for the production of both the ground substance and of the precursors of collagen, elastic fibres, and reticular fibres.

**fibrocartilage** *n.* a tough kind of **\*cartilage** in which there are dense bundles of fibres in the matrix. It is found in the intervertebral discs and pubic symphysis.

**fibrocyst** *n.* a benign tumour of fibrous connective tissue containing cystic spaces. — **fibrocystic** *adj.*

**fibrocystic disease of the pancreas** *see* **CYSTIC FIBROSIS**.

**fibrocyte** *n.* an inactive cell present in fully differentiated **\*connective tissue**. It is derived from a **\*fibroblast**.

**fibrodysplasia** *n.* abnormal development affecting connective tissue.

**fibroelastosis** *n.* overgrowth or disturbed growth of the yellow (elastic) fibres in **\*connective tissue**, especially **endocardial fibroelastosis**, overgrowth and thickening of the inner layer of the heart's left ventricle.

**fibroepithelial polyp** a fibrous overgrowth covered by epithelium, often occurring inside the mouth in response to chronic irritation (usually following accidental biting). It is sometimes called a fibrous **\*epulis**.

**fibroid 1.** *n.* (**leiomyoma, uterine fibroid**) a benign tumour of fibrous and muscular tissue, one or more of which may develop within or attached to the outside of the uterus (see illustration overleaf). Fibroids that are large or distort the uterine cavity often cause pain and excessive menstrual bleeding. There may be difficulties with fertility and childbirth. Fibroids are more common in women over 30 years of age and they shrink after the menopause unless the woman is taking HRT. Medical treatment of fibroids includes administration of **\*gonadorelin analogues** or more recently **\*ulipristal**. Small fibroids can be destroyed by diathermy using a hysteroscope. Larger ones may be coagulated by laparoscopic use of the Nd:YAG **\*laser** (**laparoscopic myolysis**) or removed by **\*myomectomy** or **\*uterine artery embolization**. Otherwise hysterectomy may be necessary. If discomfort and other symptoms are absent, surgery is not required. **2.** *adj.* resembling or containing fibres.

### Types of fibroid.

**fibroma** *n.* (*pl.* **fibromas** or **fibromata**) a benign tumour of fibrous or connective tissue origin.

**fibromyalgia** *n.* a disorder characterized by pain in the fibrous tissue components of muscles without any inflammation (*compare* **FIBROMYOSITIS**). Widespread aching and stiffness with specific tender points are accompanied by extreme fatigue and often associated with headache, numbness and tingling, and various other symptoms. Fibromyalgia is frequently triggered by anxiety, stress, sleep deprivation, and straining or overuse of muscles; it appears to be closely related to **\*CFS/ME/PVF**.

**fibromyositis** *n.* general inflammation of fibromuscular tissue.

**fibronectin** *n.* a large glycoprotein that acts as a host defence mechanism. In the plasma it induces phagocytosis and on the cell surface it induces protein linkage which is important in the formation of new epithelium in wound healing. It is also involved in platelet aggregation. It is concentrated in connective tissue and the endothelium of the capillaries and is a component of the extracellular matrix. In pregnancy, **fetal fibronectin (fFN)** is found in high concentrations in secretions from the cervix and vagina before fusion of the membranes occurs at around 21 weeks of gestation. Inflammation or trauma to the fetal–maternal surface after then causes secretion of fFN into

the cervix and vagina. Vaginal swabs that detect fFN can be used to predict preterm birth between 22 and 34 weeks gestation.

**fibroplasia** *n.* the production of fibrous tissue, which is a part of the normal healing process. *See also* **RETINOPATHY**.

**fibrosarcoma** *n.* a malignant tumour of connective tissue, derived from **\*fibroblasts**. Fibrosarcomas may arise in soft tissue or bone; they can affect any organ but are most common in the limbs, particularly the leg. They occur in people of all ages and may be congenital. The cells of these tumours show varying degrees of differentiation; the less well differentiated tumours containing elements of histiocytes have been recently reclassified as **malignant fibrous histiocyto**mas.

**fibrosis** *n.* thickening and scarring of connective tissue, most often a consequence of inflammation or injury. **Pulmonary interstitial fibrosis** is thickening and stiffening of the lining of the air sacs (alveoli) of the lungs, causing progressive breathlessness. *See also* **CYSTIC FIBROSIS**; **RETROPERITONEAL FIBROSIS**. —**fibrotic** *adj.*

**fibrositis** *n.* inflammation of fibrous connective tissue, especially an acute inflammation of back muscles and their sheaths, causing pain and stiffness. *See also* **MUSCULAR RHEUMATISM**.

**fibrous dysplasia** a developmental abnormality in which changes occur in bony tissue. Trabecular bone is replaced by fibrous tissue, resulting in aching and a tendency to pathological fracture. In **monostotic fibrous dysplasia** one bone is affected; **polyostotic fibrous dysplasia** involves many bones. There is a small risk (5–10%) of malignant transformation (**\*fibrosarcoma**).

**fibula** *n.* the long thin outer bone of the lower leg. The head of the fibula articulates with the **\*tibia** just below the knee; the lower end projects laterally as the **lateral malleolus**, which articulates with one side of the **\*talus**. —**fibular** *adj.*

**fiduciary relationship** a relationship in which one person holds a position of trust with respect to the other and is expected to act solely in the **\*best interests** of that person and to treat information shared as confidential. In medicine, the doctor–patient relationship is a fiduciary relationship.

**field of vision** *see* [VISUAL FIELD](#).

**fifth disease** *see* [ERYTHEMA](#).

**figlu test** a test for folate or vitamin B<sub>12</sub> deficiency. A dose of the amino acid histidine, which requires the presence of folate or vitamin B<sub>12</sub> for its complete breakdown, is given by mouth. In the absence of these vitamins, formiminoglutamic acid (figlu) – an intermediate product in histidine metabolism – accumulates and can be detected in the urine.

**FIGO staging** a classification drawn up by the International Federation of Gynaecology and Obstetrics to define the extent of the spread of gynaecological cancers.

**filaggrin** *n.* a filament-associated protein vital for skin barrier function. Mutations in the filaggrin gene have been associated with atopic [\\*eczema](#), other atopic disease, and [\\*ichthyosis](#) vulgaris.

**filament** *n.* a very fine threadlike structure, such as a chain of bacterial cells. —**filamentous** *adj.*

**filaria** *n.* (*pl.* **filariae**) any of the long threadlike nematode worms that, as adults, are parasites of human connective and lymphatic tissues capable of causing disease. They include the genera [\\*Brugia](#), [\\*Loa](#), [\\*Onchocerca](#), and [\\*Wuchereria](#). Filariae differ from the intestinal nematodes (*see* [HOOKWORM](#)) in that they undergo part of their development in the body of a bloodsucking insect, e.g. a mosquito, on which they subsequently depend for their transmission to another human host. *See also* [MICROFILARIA](#). —**filarial** *adj.*

**filariasis** *n.* a disease, common in the tropics and subtropics, caused by the presence in the lymph vessels of the parasitic nematode worms *Wuchereria bancrofti* and *Brugia malayi* (*see* [FILARIA](#)). The worms, which are transmitted to humans by various mosquitoes (including *Aedes*, *Culex*, *Anopheles*, and *Mansonia*), bring about inflammation and eventual blocking of lymph vessels, which causes the surrounding tissues to swell (*see* [ELEPHANTIASIS](#)). The rupture of urinary lymphatics may lead to the presence of [\\*chyle](#) in the urine. Filariasis is treated with the drug [\\*diethylcarbamazine](#).

**file** *n.* **1.** an instrument used to remove a sharp edge of bone. **2.** an instrument used in *\*endodontics* to prepare the walls of a root canal for *\*root canal treatment*. Files may be used by hand or in a *\*dental handpiece* (rotary files); they are made from stainless steel or nickel-titanium alloy.

**filiform** *adj.* shaped like a thread; for example, the threadlike **filiform papillae** of the *\*tongue*.

**filling** *n.* (in dentistry) the operation of inserting a specially prepared substance into a cavity drilled in a tooth to replace the tooth tissue that has been lost, often as a result of dental caries. The filling may be **temporary** or **permanent**, and various materials may be used (*see* *AMALGAM*; *CEMENT*; *COMPOSITE RESIN*; *GOLD*).

**filum** *n.* a threadlike structure. The **filum terminale** is the slender tapering terminal section of the spinal cord.

**FIM** *see* *FUNCTIONAL INDEPENDENCE MEASURE*.

**fimbria** *n.* (*pl.* **fimbriae**) a fringe or fringelike process, such as any of the finger-like projections that surround the opening of the ovarian end of the *\*Fallopian tube*. — **fimbrial** *adj.*

**fimbrial cyst** a simple cyst of the *\*fimbria* of the Fallopian tube.

**finasteride** *n.* a drug that causes shrinkage of the prostate gland. It is administered by mouth both to relieve the symptoms of urinary retention caused by an enlarged gland obstructing the outflow of urine from the bladder and to reduce the risk of urinary retention. An *\*anti-androgen*, the drug acts by reducing androgenic stimulation of the prostate, inhibiting the enzyme 5 $\alpha$ -reductase, responsible for converting testosterone to its more active metabolite, *\*dihydrotestosterone*, within the gland. Side-effects include impotence and breast pain and enlargement. A low-dose formulation of finasteride is used to treat baldness in men.

**fine-needle aspiration cytology (FNA cytology)** a technique in which a thin hollow needle is inserted into a mass to extract a tissue sample for microscopic examination. It is useful for detecting the presence of malignant cells, particularly in lumps of the breast and thyroid. *See also* *ASPIRATION CYTOLOGY*.

**finger-flexion reflex** *see* **HOFFMANN'S SIGN**.

**finger-nose test** a test for **\*ataxia** or cerebral lesions. Using the index finger, the patient alternately touches his or her nose and then the examiner's finger, which is shifted to a new position for each of the patient's movements. The test is positive if the patient misses a target or develops a tremor as the target is approached (intention tremor).

**fingerprint** *n.* the distinctive pattern of minute ridges in the outer horny layer of the skin. Every individual has a unique pattern of loops (70%), whorls (25%), or arches (5%) (see illustration). Fingerprint patterns can show the presence of inherited disorders. *See also* **DERMATOGLYPHICS**.

**Fingerprint.** Ridges on the hand, with details of the most common fingerprints.

**finished consultant episode (FCE)** the time a patient spends in the care of one consultant in one health-care provider. If a patient is transferred to a different hospital provider or a different consultant within the same hospital, a new FCE begins. In **\*hospital episode statistics** an FCE is commonly referred to as simply an 'episode'. A **\*spell** may consist of several episodes. *See also* **CONTINUOUS PATIENT PATHWAY**.

**firedamp** *n.* (in mining) an explosive mixture of gases, usually containing a high proportion of methane, occasionally encountered in pockets underground. It can be distinguished from **\*blackdamp** (chokedamp), which does not ignite.

**first aid** procedures used in an emergency to help a wounded or ill patient before the arrival of a doctor or admission to hospital.

**first do no harm** *see* **PRIMUM NON NOCERE**. *See also* **NONMALEFICENCE**.

**first intention** *see* **INTENTION**.

**first-line treatment** therapy that is the first choice for treating a particular condition; other (second-line) treatments are used only if first-line therapy has failed.

**first-pass metabolism** a process in which a drug administered by mouth is absorbed from the gastrointestinal tract and transported via the portal vein to the liver, where it is metabolized. As a result, in some cases only a small proportion of the active drug reaches the systemic circulation and its intended target tissue. First-pass metabolism can be bypassed by giving the drug via sublingual or buccal routes.

**first-rank symptom** *see* **SCHNEIDERIAN FIRST- AND SECOND-RANK SYMPTOMS**.

**FISH (fluorescence in situ hybridization)** a technique that allows the nuclear DNA of **\*interphase** cells or the DNA of **\*metaphase** chromosomes, which are fixed to a glass microscope slide, to anneal with a fluorescent gene **\*probe**. It is used for detecting and locating gene mutations and chromosome abnormalities.

**fission** *n.* a method of asexual reproduction in which the body of a protozoan or bacterium splits into two equal parts (**binary fission**), as in the *\*amoebae*, or more than two equal parts (**multiple fission**), for example sporozoite formation in the malarial parasite (see **PLASMODIUM**). The resulting products of fission eventually grow into complete organisms.

**fissure** *n.* **1.** (in anatomy) a groove or cleft; e.g. the **fissure of Sylvius** is the groove that separates the temporal lobe of the brain from the frontal and parietal lobes. **2.** (in pathology) a cleft-like defect in the skin or mucous membranes. See **ANAL FISSURE**. **3.** (in dentistry) a naturally occurring groove in the enamel on the surface of a tooth, especially a premolar or molar. It is a common site of dental caries.

**fissure sealant** (in dentistry) a plastic coating that is bonded to the enamel surface of premolar and molar teeth to seal the fissures, in order to prevent dental caries. Composite resins, unfilled resins, and glass ionomer cements have been used as fissure sealants.

**fistula** *n.* (*pl.* **fistulae**) **1.** an abnormal communication between two hollow organs, connecting two mucosa-lined surfaces, or between a hollow organ and the exterior. Many fistulae are caused by infection or injury. For example, an **anal fistula** may develop after an abscess in the rectum has burst (see **ISCHIORECTAL ABSCESS**), creating an opening between the anal canal and the surface of the skin. *\*Crohn's disease* has a particular tendency to cause fistulae to form between adjacent loops of bowel or from bowel to bladder, vagina, or skin. Some fistulae result from malignant growths or ulceration: a carcinoma of the colon may invade and ulcerate the adjacent wall of the stomach, causing a **gastrocolic fistula**. Other fistulae develop as complications of surgery: after gall-bladder surgery, for example, bile may continually escape to the surface through the wound producing a **biliary fistula**. Fistulae may also be a form of congenital abnormality; examples include a **tracheo-oesophageal fistula** (between the windpipe and gullet) and a **rectovaginal fistula** (between the rectum and vagina). **2.** (**arteriovenous fistula**) a surgically created connection between an artery and a vein, usually in a limb, to create arterial and venous access for *\*haemodialysis*. It can be a direct *\*anastomosis* between the artery and vein or a loop connecting the two, which may be autogenous or prosthetic.

**fistulography** *n.* imaging of a **\*fistula**. X-rays can be used to visualize the fistula after injection of a radiopaque **\*contrast medium**, usually through an opening in the skin after inserting a catheter, to see the extent of a fistula and the structures with which it communicates. In **\*haemodialysis** patients, contrast is injected through a needle into the vessels around the surgical fistula to look for blockages or narrowings that are compromising flow. **\*Magnetic resonance imaging** is the procedure of choice for examining fistulae around the rectum and anus.

**fistuloplasty** *n.* a technique to open up a narrowed arteriovenous **\*fistula** by surgery or by inserting an angioplasty **\*balloon** into the narrowed area and stretching it open. *See* **DECLOTTING**.

**fit** *n.* a sudden attack. The term is commonly used specifically for the seizures of **\*epilepsy** but it is also used more generally, e.g. a fit of coughing.

**Fitz-Hugh–Curtis syndrome** a condition in which infection due to **\*pelvic inflammatory disease** spreads to the right upper quadrant of the **\*abdomen**. Adhesions form between the liver and the anterior abdominal wall causing **\*perihepatitis**, with pain and liver function abnormalities. [T. Fitz-Hugh and A. H. Curtis (20th century), US physicians]

**fixation** *n.* **1.** (in psychoanalysis) a failure of psychological development, in which traumatic events prevent a child from progressing to the next developmental stage. *See also* **PSYCHOSEXUAL DEVELOPMENT**. **2.** a procedure for the hardening and preservation of tissues or microorganisms to be examined under a microscope. Fixation kills the tissues and ensures that their original shape and structure are retained as closely as possible. It also prepares them for sectioning and staining. The specimens can be immersed in a chemical **\*fixative** or subjected to **\*freeze drying**.

**fixative (fixing agent)** *n.* a chemical agent, e.g. alcohol or osmium tetroxide, used for the preservation and hardening of tissues for microscopical study. *See* **FIXATION**.

**flaccid** *adj.* **1.** flabby and lacking in firmness. **2.** characterized by a decrease in or absence of muscle tone. In **flaccid paralysis** there is absence of muscle tone in one or both limbs, and tendon reflexes are absent. It is a sign of

damage to lower *\*motor neurons*. Compare SPASTIC PARALYSIS. — **flaccidity** *n.*

**flagellate** *n.* a type of *\*protozoan* with one or more fine whiplike threads (see FLAGELLUM) projecting from its body surface, by means of which it is able to swim. Some flagellates are parasites of humans and are therefore of medical importance. See TRYPANOSOMA; LEISHMANIA; GIARDIA; TRICHOMONAS.

**flagellum** *n.* (*pl.* **flagella**) a fine long whiplike thread attached to certain types of cell (e.g. spermatozoa and some unicellular organisms). Flagella are responsible for the movement of the organisms to which they are attached.

**flail chest** fracture of two or more ribs in two or more places, resulting from trauma. It produces an unstable ‘flail’ segment and is often associated with underlying lung trauma or pneumothorax. It leads to asphyxia unless corrected promptly.

**flap** *n.* **1.** (in surgery) a strip of tissue dissected away from the underlying structures but left attached at one end so that it retains its blood and nerve supply in a *\*pedicle*. The flap is then used to repair a defect in another part of the body by suturing its free end into the area. When the flap has ‘healed into’ its new site the other end can be detached and the remainder of the flap can be sewn in, depending on the type of flap being used. Flaps are commonly used by plastic surgeons in treating patients who have suffered severe skin and tissue loss after mutilating operations (e.g. mastectomy; see TRAM FLAP) or after burns or injuries not amenable to repair by split skin grafting (see SKIN GRAFT). Skin flaps may also be used to cover the end of a bone in an amputated limb. In neurosurgery combined skin and bone (**osteoplastic**) flaps are commonly raised to provide access to the cranium. **2.** (in dentistry) a piece of mucous membrane and periosteum attached by a broad base. It is lifted back to expose the underlying bone and enable a procedure such as surgical *\*extraction* or *\*apicectomy* to be performed. It is subsequently replaced and stabilized using sutures during the healing period.

**flare** *n.* **1.** reddening of the skin that spreads outwards from a focus of infection or irritation in the skin. **2.** the red area surrounding an urticarial weal. **3.** (**aqueous flare**) the visible passage of a beam of light through the

aqueous humour, which is a sign of inflammation of the anterior segment of the eye. The light is scattered by proteins in the aqueous humour that have exuded from blood vessels (see [EXUDATION](#)).

**flashback** *n.* **1.** vivid involuntary reliving of the perceptual abnormalities experienced during a previous episode of drug intoxication, including [\\*hallucinations](#) and [\\*derealization](#), most commonly experienced with LSD. **2.** a symptom of [\\*post-traumatic stress disorder](#) characterized by the reliving of a traumatic experience.

**flat-foot** *n.* absence or collapse of the arch along the instep of the foot, so that the sole lies flat upon the ground. It is common in children until the age of six years, by which time the arch will usually have developed. Flat-foot that persists into adulthood may be due to an underlying bony disorder (**rigid flat-foot**) and may require surgery. Medical name: **pes planus**.

**flat-panel detector** a piece of equipment used instead of a conventional X-ray film to acquire the image in [\\*digital radiography](#).

**flatulence** *n.* **1.** the expulsion of intestinal gas by belching, or by emission from the anus. **2.** a sensation of abdominal distension. —**flatulent** *adj.*

**flatus** *n.* intestinal gas, passed through the rectum, composed partly of swallowed air and partly of gas produced by bacterial fermentation of intestinal contents. It consists mainly of hydrogen, carbon dioxide, and methane in varying proportions. Indigestible nonabsorbable carbohydrates in some foods (e.g. beans) cause increased volumes of flatus.

**flatworm (platyhelminth)** *n.* any of the flat-bodied worms, including the [\\*flukes](#) and [\\*tapeworms](#). Both these groups contain many parasites of medical importance.

**flav- (flavo-)** *combining form denoting yellow.*

**flavin adenine dinucleotide** *see* [FAD](#).

**flavin mononucleotide** *see* [FMN](#).

**flavivirus** *n.* any member of a genus (and family) of [\\*arboviruses](#) that cause a wide range of diseases in vertebrates (including humans). Transmitted by

ticks or mosquitoes, these include *\*yellow fever*, *\*dengue*, *\*Kyasanur Forest disease*, *\*Russian spring-summer encephalitis*, and *\*West Nile fever*.

**flavoprotein** *n.* a compound consisting of a protein bound to either *\*FAD* or *\*FMN* (called **flavins**). Flavoproteins are constituents of several enzyme systems involved in intermediary metabolism.

**flea** *n.* a small wingless bloodsucking insect with a laterally compressed body and long legs adapted for jumping. Adult fleas are temporary parasites on birds and mammals and those species that attack humans (*\*Pulex*, *\*Xenopsylla*, and *\*Nosopsyllus*) may be important in the transmission of various diseases. Their bites are not only a nuisance but may become a focus of infection. Appropriate insecticide powders are used to destroy fleas in the home.

**flecainide** *n.* a drug used to control irregular heart rhythms (see *ARRHYTHMIA*). Possible side-effects include oedema, dizziness, vertigo, breathlessness, fever, and visual disturbances.

**Fleischer ring** a deposit of iron in the form of a ring in the epithelium of the cornea, which is seen, for example, around the base of the ‘cone’ of the cornea in *\*keratoconus*. It is best visualized using cobalt blue light. [B. Fleischer (1848–1904), German physician]

**Fleischner criteria** internationally recognized recommendations for the follow-up for incidentally discovered nodules on a CT scan of the chest that may be early carcinomas. This is designed for nodules smaller than 8 mm and not amenable to biopsy. The patients are divided into low- and high-risk groups. Risk stratification will depend on smoking history and other factors, such as asbestos exposure. Nodules are divided into four groups: less than 4 mm, 4–6 mm, 6–8 mm, and 8 mm or larger. Low-risk patients with nodules smaller than 4 mm receive no follow-up; for larger nodules or in high-risk patients scans are performed at 3, 6, 9, 12, and 24 months according to size and risk levels. [F. Fleischner (1893–1969), Austrian-born US radiologist]

**flexibilitas cerea** see *CATATONIA*.

**flexion** *n.* the bending of a joint so that the bones forming it are brought towards each other. **Plantar flexion** is the bending of the toes (or fingers) downwards, towards the sole (or palm). See also *DORSIFLEXION*.

**flexor** *n.* any muscle that causes bending of a limb or other part.

**flexure** *n.* a bend in an organ or part, such as the **hepatic** and **splenic flexures** of the *\*colon*. —**flexural** *adj.*

**flight of ideas** accelerated thinking that occurs in psychosis, mania, hypomania, and attention-deficit/hyperactivity disorder. Speech is rapid, moving from one topic to another and reflecting casual associations between ideas. In contrast to *\*loosening of associations*, the link between themes is preserved, albeit often difficult to follow.

**floaters** *pl. n.* opacities in the vitreous humour of the eye, which cast a shadow on the retina and are therefore seen as shapes or spots (**muscae volitantes**) against a bright background in good illumination. They are a form of *\*entoptic phenomenon*.

**floccillation (carphology)** *n.* plucking at the bedclothes by a delirious patient.

**flocculation** *n.* a reaction in which normally invisible material leaves solution to form a coarse suspension or precipitate as a result of a change in physical or chemical conditions. *See also* **AGGLUTINATION**.

**flocculent** *adj.* describing a fluid containing woolly, fluffy, or flaky white particles, usually due to bacterial contamination.

**flocculus** *n.* a small ovoid lobe of the *\*cerebellum*, overhung by the posterior lobe and connected centrally with the nodulus in the midline.

**flooding** *n.* **1.** excessive bleeding from the uterus, as in *\*menorrhagia* or miscarriage. **2.** (in psychology) a method of treating *\*phobias* in which the patient is exposed intensively and at length to the feared object, either in reality or fantasy. Although it is distressing and needs good motivation if treatment is to be completed, it is an effective and rapid form of therapy.

**floppy baby syndrome** *see* **AMYOTONIA CONGENITA**.

**flow cytometry** a technique in which cells are tagged with a fluorescent dye and then directed single file through a laser beam. The intensity of *\*fluorescence* induced by the laser beam is proportional to the amount of DNA in the cells.

**flowmeter** *n.* an instrument for measuring the flow of a liquid or gas. Anaesthetic equipment has to be fitted with flowmeters so that the administration of anaesthetic gases in different proportions can be controlled. Flowmeters are widely used by asthma sufferers to measure their ability to expire air.

**flucloxacillin** *n.* a semisynthetic **\*penicillin** that is effective against bacteria producing **\*penicillinase** and is used to treat infections caused by penicillinase-producing staphylococci. Possible side-effects are allergic reactions to penicillin, gastrointestinal disturbances, and (rarely) liver damage.

**fluconazole** *n.* an antifungal drug used to treat candidiasis and other fungal infections. Possible side-effects include nausea and vomiting.

**fluctuation** *n.* the characteristic feeling of a wave motion produced in a fluid-filled part of the body by an examiner's fingers. If fluctuation is present when a swelling is examined, this is an indication that there is fluid within it and that the swelling is not due to a solid growth.

**flucytosine** *n.* an antifungal drug that is effective against systemic infections, including cryptococcosis and candidiasis. Side-effects may include nausea and vomiting, diarrhoea, rashes, and blood disorders.

**fludrocortisone** *n.* a synthetic mineralocorticoid (*see* **CORTICOSTEROID**) used to treat disorders of the adrenal glands marked by deficient production of aldosterone. Side-effects include muscle weakness, bone disorders, digestive and skin disorders, and fluid retention.

**fluid level** the radiographic finding of a straight line between fluid and gas within a hollow organ or cavity when a horizontal X-ray beam strikes the fluid surface tangentially. Multiple long fluid levels are seen in loops of small bowel that are obstructed. A fluid level in the lung suggests a cavity that is partially filled with fluid (e.g. an abscess).

**fluke** *n.* any of the parasitic flatworms belonging to the group Trematoda. Adult flukes, which have suckers for attachment to their host, are parasites of humans, occurring in the liver (**liver flukes**; *see* **FASCIOLA**), lungs (*see* **PARAGONIMUS**), gut (*see* **HETEROPHYES**), and blood vessels (**blood**

**flukes**; *see* [SCHISTOSOMA](#)) and often cause serious disease. Eggs, passed out with the host's stools, hatch into larvae called [\\*miracidia](#), which penetrate an intermediate snail host. Miracidia give rise asexually to [\\*redia](#) larvae and finally [\\*cercariae](#) in the snail's tissues. The released cercariae may enter a second intermediate host (such as a fish or crustacean); form a cyst ([\\*metacercaria](#)) on vegetation; or directly penetrate the human skin.

**flumazenil** *n.* a [\\*benzodiazepine](#) antagonist drug, used to reverse the sedative effects of benzodiazepines given during anaesthesia.

**flunisolide** *n.* an anti-inflammatory corticosteroid drug used in the prevention and treatment of hay fever. The most common side-effect is local irritation.

**fluocinolone** *n.* a synthetic corticosteroid used topically to reduce inflammation in such skin conditions as eczema; it may also be used in the short-term treatment of psoriasis. Side-effects include burning, itching, and local eruptions. Administered as an implant into the vitreous humour, it is used to treat oedema associated with diabetic [\\*retinopathy](#).

**fluorescein sodium** a water-soluble orange dye that glows with a brilliant green colour when blue light is shone on it. A dilute solution is used to detect defects in the surface of the cornea, since it stains areas where the [\\*epithelium](#) is not intact. In retinal [\\*angiography](#) it is injected into a vein and its circulation through the blood vessels of the retina is viewed and photographed by a special camera.

**fluorescence** *n.* the emission of light by a material as it absorbs radiation from outside. The radiation absorbed may be visible or invisible (e.g. ultraviolet rays or X-rays). *See* [FLUOROSCOPE](#). —**fluorescent** *adj.*

**fluorescence in situ hybridization** *see* [FISH](#).

**fluoridation** *n.* the controlled addition of [\\*fluoride](#) to the public drinking water supply in order to reduce [\\*dental caries](#). Drinking water with a fluoride ion content of one part per million is effective in reducing caries throughout life when given during the years of tooth development. *See also* [FLUOROSIS](#).

**fluoride** *n.* a compound of fluorine. The incorporation of fluoride ions in the enamel of teeth makes them more resistant to [\\*dental caries](#). The ions enter

enamel during its formation, and after tooth eruption by surface absorption, forming hydroxyfluorapatite. The addition of fluoride to public water supplies is called **\*fluoridation**. Fluoride may also be applied topically in toothpaste or by a dentist. If the water supply contains too little fluoride, fluoride salts may be given to children in the form of mouthwashes, drops, or tablets.

**fluorodeoxyglucose (FDG)** *n.* a variant of normal glucose in the body that is not metabolized and therefore accumulates in areas of high metabolism, such as tumours and areas of infection. It can be labelled with radioactive fluorine-18 and is in common use in PET scanning (*see* **POSITRON EMISSION TOMOGRAPHY**).

**fluoropyrimidine** *n.* any one of a class of **\*antimetabolite** drugs used in the treatment of gastrointestinal malignancies and breast cancer. They include **\*fluorouracil** and the orally administered drugs **\*capecitabine** and **tegafur**.

**fluoroscope** *n.* historically, an instrument by which X-rays were projected through a patient onto a fluorescent screen enabling the resultant image to be viewed directly by the radiologist. However, this resulted in high radiation doses for the radiologist. For diagnostic purposes the screen has been replaced by the **\*image intensifier** and TV monitor.

**fluoroscopy** *n.* the use of a **\*fluoroscope** to visualize X-ray images. **\*Videofluoroscopy** is synonymous with X-ray screening. It is valuable for observing moving structures (e.g. swallowed barium sulphate) or for guiding **\*interventional radiology** procedures.

**fluorosis** *n.* a cosmetic condition that affects the teeth as a result of high **\*fluoride** intake during the first eight years of life, i.e. during enamel formation. Dental fluorosis is characterized by mottled enamel, which is opaque and may be stained. Its incidence increases when the level of fluoride in the water supply is above 2 parts per million. The mottled enamel is resistant to dental caries. When the level is over 8 parts per million, systemic fluorosis may occur, with calcification of ligaments.

**fluorouracil (5FU)** *n.* a drug that prevents cell growth (*see* **ANTIMETABOLITE**) and is used in the treatment of solid tumours, such as cancers of the digestive system and breast (*see also* **FOLINIC ACID**). Side-

effects may include digestive and skin disorders, mouth ulcers, hair loss, nail changes, and blood disorders (see [MYELOSUPPRESSION](#)). Fluorouracil is also applied as a cream to treat certain skin conditions, including skin cancer.

**fluoxetine** *n.* an [\\*antidepressant](#) drug that acts by prolonging the action of the neurotransmitter serotonin (5-hydroxytryptamine) in the brain (see [SSRI](#)). It is used to treat depression, bulimia nervosa, and obsessive–compulsive disorder. Possible side-effects include nausea, vomiting, diarrhoea, allergic reactions (e.g. rash), insomnia, and anxiety.

**flupentixol (flupenthixol)** *n.* a thioxanthene [\\*antipsychotic](#) drug used to treat schizophrenia and other psychoses and depression. Possible side-effects include abnormal involuntary movements (see [EXTRAPYRAMIDAL EFFECTS](#)).

**fluphenazine** *n.* a phenothiazine [\\*antipsychotic](#) drug used for the treatment of schizophrenia and other psychotic disorders. Side-effects include abnormal muscular movements (see [EXTRAPYRAMIDAL EFFECTS](#)).

**flurazepam** *n.* a benzodiazepine drug used for the short-term relief of insomnia and sleep disturbances (see [HYPNOTIC](#)). It sometimes causes morning drowsiness, dizziness, and muscle incoordination.

**flurbiprofen** *n.* an analgesic that relieves inflammation (see [NSAID](#)), used in the treatment of rheumatoid arthritis, osteoarthritis, dysmenorrhoea, and other painful conditions and to prevent contraction of the pupil during eye surgery. Side-effects may include gastrointestinal upset, diarrhoea, and nausea.

**flush** *n.* reddening of the face and/or neck. **Hectic flush** occurs in such wasting diseases as pulmonary tuberculosis. A **hot flush**, accompanied by a feeling of heat, occurs in some emotional disorders and during the menopause (see [VASOMOTOR SYMPTOMS](#)).

**flutamide** *n.* a nonsteroidal [\\*anti-androgen](#) commonly used in the treatment of advanced prostate cancer, either alone or in combination with [\\*gonadorelin analogues](#). Side-effects include gynaecomastia (breast enlargement) and diarrhoea.

**fluticasone propionate** a corticosteroid used for the prophylaxis of asthma, the prophylaxis and treatment of hay fever and perennial rhinitis, and the treatment of dermatitis and eczema.

**flutter** *n.* a disturbance of normal heart rhythm that – like **\*fibrillation** – may affect the atria or ventricles. However, the arrhythmia is less rapid and less chaotic. The causes and treatment are similar to those of fibrillation. *See also* **CARDIAC ARREST**; **DEFIBRILLATION**.

**fluvastatin** *n.* *see* **STATIN**.

**fluvoxamine** *n.* an **\*antidepressant** drug that acts by prolonging the action of the neurotransmitter serotonin (5-hydroxytryptamine) in the brain (*see* **SSRI**). Side-effects may include sleepiness, agitation, tremor, vomiting, and diarrhoea.

**flux** *n.* an abnormally copious flow from an organ or cavity. **Alvine flux** is **\*diarrhoea**.

**fly** *n.* a two-winged insect belonging to a large group called the Diptera. The mouthparts of flies are adapted for sucking and sometimes also for piercing and biting. Fly larvae (maggots) may infest human tissues and cause disease (*see* **MYIASIS**).

**FMN (flavin mononucleotide)** a derivative of riboflavin (vitamin B<sub>2</sub>) that is the immediate precursor of **\*FAD** and functions as a **\*coenzyme** in various oxidation-reduction reactions.

**FNA** *see* **FINE-NEEDLE ASPIRATION CYTOLOGY**.

**FOBT** *see* **FAECAL OCCULT BLOOD TEST**.

**focal distance** (of the eye) the distance between the lens and the point behind the lens at which light from a distant object is focused. In a normally sighted person the point of focus is on the retina, but in **\*myopia** (short-sightedness) the focus is in front of the retina and in **\*hypermetropia** (long-sightedness) the point of focus is beyond the retina.

**focal segmental glomerulosclerosis (FSGS)** a condition in which there is scarring in some (focal) glomeruli that affects only part (segmental) of the

glomerular capillary tuft. Primary FSGS overlaps with *\*minimal change nephropathy* and typically presents with the *\*nephrotic syndrome*. Secondary FSGS has a wide range of causes, from viral infections, including HIV, to haemodynamic changes associated with reduced renal mass, hypertension, and obesity, and is usually associated with less severe proteinuria.

**focus** **1.** *n.* the point at which rays of light converge after passing through a lens. **2.** *n.* the principal site of an infection or other disease. **3.** *n.* (in radiography) the point of origin of an X-ray beam. **4.** *vb.* (in ophthalmology) to accommodate (*see also* *ACCOMMODATION*).

**FODMAPS** *n.* an *\*elimination diet* in which foods containing short-chain fermentable carbohydrates (*fermentable, oligosaccharides, disaccharides, monosaccharides, and polyols*) are avoided. These carbohydrates are poorly absorbed in the small intestine leading to changes in bacterial fermentation and fluid content, thus triggering functional gut symptoms, such as diarrhoea and constipation in susceptible individuals. It is used primarily to treat *\*irritable bowel syndrome*.

**foetus** *n.* *see* *FETUS*.

**folate (pteroylglutamic acid)** *n.* a B vitamin that is important in the synthesis of nucleic acids. The metabolic role of folate is interdependent with that of *\*vitamin B<sub>12</sub>* (both are required by rapidly dividing cells) and a deficiency of one may lead to deficiency of the other. A deficiency of folate results in megaloblastic anaemia. Good sources of folate include liver, green leafy vegetables, brown rice, and fortified breakfast cereals. The RNI (*see* *DIETARY REFERENCE VALUES*) for adults is 200 µg/day. Women planning a pregnancy, and during the first trimester, should take a supplement of 400 µg/day to prevent neural tube defects (e.g. spina bifida) and other congenital malformations (e.g. cleft lip and cleft palate) in the fetus.

**fold** *n.* (in anatomy and embryology) the infolding of two surfaces or membranes.

**folic acid** a synthetic form of *\*folate*, which can be added to foods or used as a supplement for treating folate-deficient states.

**folie à deux (shared delusion)** a condition in which two people who are closely involved with each other share one or more delusions. Usually, one member of the pair, called the **inducer**, has developed a *\*psychosis* and has imposed it on the other by a process of suggestion. More rarely, both members are delusional and elaborate their delusions or hallucinations together. More than two people may be involved (**folie à trois**, **folie à quatre**, etc.). Treatment usually involves separation of the affected people and management according to their individual requirements. The inducer usually requires antipsychotic medication. *See also* **DELUSION BY PROXY**; **DOUBLE DELUSION**.

**folinic acid** a derivative of folic acid involved in purine synthesis. It is used to reverse the biological effects of methotrexate and other *\*dihydrofolate reductase inhibitors* and so to prevent excessive toxicity. This action is termed **folinic acid rescue**. Folinic acid has a potentiating effect with *\*fluorouracil*, with which it is often used.

**folium** *n.* (*pl.* **folia**) a thin leaflike structure, such as any of the folds on the surface of the cerebellum.

**follicle** *n.* **1.** (in anatomy) a small secretory cavity, sac, or gland, such as any of the cavities in the *\*ovary* in which the ova are formed. *See also* **GRAAFIAN FOLLICLE**; **HAIR FOLLICLE**. **2.** (in ophthalmology) any of the smooth translucent elevations of the conjunctiva produced by an immune response. They are usually associated with viral inflammation. —**follicular** *adj.*

**follicle-stimulating hormone (FSH)** a hormone (*see* **GONADOTROPHIN**) synthesized and released by the anterior pituitary gland. FSH stimulates ripening of the follicles in the ovary and formation of sperm in the testes. It is administered by injection to treat sterility due to lack of ovulation, amenorrhoea, and decreased sperm production. Stimulation of ovulation by FSH may, in some cases, lead to multiple pregnancy.

**follicular cyst** *see* **OVARIAN CYST**.

**follicular occlusion tetrad** the combination of major acne, *\*pilonidal sinus*, chronic scalp *\*folliculitis*, and *\*hidradenitis suppurativa*.

**folliculitis** *n.* inflammation of hair follicles in the skin, commonly caused by bacterial infection. Folliculitis caused by *Malassezia* yeasts may be related to HIV infection.

**fomentation** *n.* *see* **POULTICE**.

**fomes** *n.* (*pl.* **fomites**) any object that is used or handled by a person with a **\*communicable disease** and may therefore become contaminated with the infective organisms and transmit the disease to a subsequent user. Common fomites are towels, bed-clothes, cups, and money.

**fontanelle** *n.* an opening in the skull of a fetus or young infant due to incomplete **\*ossification** of the cranial bones and the resulting incomplete closure of the **\*sutures**. The **anterior fontanelle** occurs where the coronal, frontal, and sagittal sutures meet; the **posterior fontanelle** occurs where the sagittal and lambdoidal sutures meet (see illustration).

**Fontanelles (from above).**

**Food and Drug Administration (FDA)** in the USA, the federal agency within the **\*Department of Health and Human Services** responsible for ensuring that foods are safely edible; that medications (for humans and animals), biological products, and medical devices are safe and effective; and that cosmetics and electronic products that emit radiation are safe. The FDA is also responsible for ensuring the accuracy of the advertisements and labelling related to these products.

**food intolerance** nonallergic food hypersensitivity: a non-life-threatening reaction (often delayed) to a food, drink, food additive, or compound that results in symptoms in the respiratory system, gut, or skin. It can result from metabolic reactions, pharmacological reactions, or malabsorption; treatment uses **\*elimination** and exclusion diets and the formation of tolerance over a period of time.

**food poisoning** an illness affecting the digestive system that results from eating food that is contaminated by bacteria or bacterial toxins, viruses, or (less commonly) by residues of insecticides (on fruit and vegetables) or poisonous chemicals such as lead or mercury. It can also be caused by eating poisonous fungi, berries, etc. Symptoms commence 1–24 hours after ingestion and include nausea, vomiting, diarrhoea, and abdominal pain. Food-borne infections are caused by bacteria of the genera **\*Salmonella**, **\*Campylobacter**, and **\*Listeria** in foods of animal origin. The disease is transmitted by human carriers who handle the food, by shellfish growing in sewage-polluted waters, or by vegetables fertilized by manure. Toxin-producing bacteria causing food poisoning include those of the genus *Staphylococcus*, which rapidly multiply in warm foods; pathogenic **\*Escherichia coli**; and the species *Clostridium perfringens*, which multiplies in reheated cooked meals. A rare form of food poisoning – **\*botulism** – is caused by toxins produced by the bacterium *Clostridium botulinum*, which may contaminate badly preserved canned foods. *See also* **GASTROENTERITIS**.

**foot** *n.* the terminal organ of the lower limb. From a surgical point of view, the human foot comprises the seven bones of the **\*tarsus**, the five metatarsal bones, and the phalangeal bones plus the surrounding tissues; anatomically, the bones and tissues of the ankle are excluded.

**footling** *n.* a **\*breech presentation** in which the baby's feet are presented below its buttocks so that it will be delivered feet first.

**foramen** *n.* (*pl.* **foramina**) an opening or hole, particularly in a bone. The **apical foramen** is the small opening at the apex of a tooth. The **foramen magnum** is a large hole in the occipital bone through which the spinal cord passes. The **foramen ovale** is the opening between the two atria of the fetal

heart, which allows blood to flow from the right to the left side of the heart by displacing a membranous valve.

**forced expiratory volume (FEV)** the volume of air exhaled in a given period (usually limited to 1 second in tests of vital capacity). FEV is reduced in patients with obstructive airways disease and diminished lung volume.

**forced preferential looking test (FPL test)** a test used to evaluate the \*visual acuity of infants and young children by observing whether the child looks at a blank screen or one with stripes, the spatial frequency of which can be changed.

**forceps** *n.* a pincer-like instrument designed to grasp an object so that it can be held firm or pulled. Specially designed forceps – of which there are many varieties – are used by surgeons and dentists in operations (see illustration). The forceps used in childbirth are so designed as to fit firmly round the baby's head without damaging it. Dental **extraction forceps** are specially designed to fit the various shapes of teeth. By having long handles and short beaks they provide considerable leverage.

dissecting forceps

bone holding forceps

sinus forceps

dressing forceps

obstetric forceps

dental extraction forceps

### Types of forceps.

**Fordyce spots** visible sebaceous glands present in most individuals. They are 1–3-mm painless papules that may be noticed on the scrotum, shaft of the penis, labia, and inner surface and border of the lips. They become more visible from puberty onwards and are easier to see when the skin is stretched. Completely harmless, they are not sexually transmitted or infectious and do not require any treatment. [J. A. Fordyce (1858–1925), US dermatologist]

**forebrain** *n.* the furthest forward division of the **\*brain**, consisting of the **\*diencephalon** and the two cerebral hemispheres.

**foregut** *n.* the front part of the embryonic gut, which gives rise to the oesophagus (gullet), stomach, and part of the small intestine (from which the liver and pancreas develop).

**forensic medicine** the branch of medicine concerned with the scientific investigation of the causes of injury and death in unexplained circumstances, particularly when criminal activity is suspected. Such investigations are carried out chiefly by pathologists at the request of a **\*coroner**, in conjunction with other experts and police investigators.

**forequarter amputation** an operation involving removal of an entire arm, including the scapula and clavicle. It is usually performed for soft tissue or bone sarcomas arising from the upper arm or shoulder. *Compare* **HINDQUARTER AMPUTATION**.

**foreskin** *n.* *see* **PREPUCE**.

**forewaters** *n.* the **\*amniotic fluid** that escapes from the uterus through the vagina when that part of the amnion lying in front of the presenting part of the fetus ruptures, either spontaneously or by **\*amniotomy**. Spontaneous rupture is usual in labour but rupture may occur before labour starts (premature rupture of membranes).

**formaldehyde** *n.* the aldehyde derivative of formic acid, formerly used as a vapour to sterilize and disinfect rooms and such items as mattresses and blankets. The toxic vapour is produced by boiling **\*formalin** in an open container or using it in a sealed autoclave.

**formalin** *n.* a solution containing 40% formaldehyde in water, used as a sterilizing agent and, in pathology, as a fixative. It is lethal to bacteria, viruses, fungi, and spores and is used to treat wools and hides to kill anthrax spores. Heating the solution produces the irritating vapour of **\*formaldehyde**, which is also used for disinfection.

**formal thought disorder** thought disturbance characterized by disconnected thinking, manifested by disturbed speech in which the patient's train of thought cannot be followed. Formal thought disorder was first described by

the German psychiatrist Kurt Schneider and later elaborated on by various authors. Looking for evidence of formal thought disorder is part of every *\*mental state examination*. It includes *\*loosening of associations*, omissions, and *\*knight's-move thinking*.

**forme fruste** an atypical form of a disease in which the usual symptoms fail to appear and its progress is stopped at an earlier stage than would ordinarily be expected.

**formication** *n.* a prickling sensation said to resemble the feeling of ants crawling over the skin. It is sometimes a symptom of drug intoxication and has also been reported by patients with Parkinson's disease and multiple sclerosis.

**formoterol (eformoterol)** *n.* a *\*sympathomimetic* drug (a  $\beta_2$  agonist) used, with inhaled corticosteroids (*see also* **BUDESONIDE**), as a long-acting *\*bronchodilator* to control chronic asthma and chronic obstructive pulmonary disease. Side-effects include tremor, palpitations, and headache.

**formulary** *n.* a compendium of formulae used in the preparation of medicinal drugs.

**fornix** *n.* (*pl.* **fornices**) an arched or vaultlike structure, especially the fornix cerebri, a triangular structure of white matter in the brain, situated between the hippocampus and hypothalamus. The **fornix of the vagina** is any of three vaulted spaces at the top of the vagina, around the cervix of the uterus. The superior (upper) and inferior (lower) **fornices of the conjunctiva** are the loose folds of conjunctiva reflected between the posterior aspect of the eyelid and the eyeball.

**forward parachute reflex** a reflex action of the body that develops by five to six months and never disappears. If the body is held by the waist face down and lowered, the arms and legs extend automatically.

**foscarnet** *n.* an antiviral drug used in the treatment of herpes simplex and *\*cytomegalovirus* retinitis that are resistant to *\*aciclovir*, especially in patients with AIDS. Possible side-effects include thirst and increased urine output, nausea and vomiting, fatigue, headache, and kidney damage.

**fossa** *n.* (*pl.* **fossae**) a depression or hollow. The **cubital fossa** is the triangular hollow at the front of the elbow joint; the **iliac fossa** is the depression in the inner surface of the ilium; the **pituitary fossa** is the hollow in the sphenoid bone in which the pituitary gland is situated; a **tooth fossa** is a pit in the enamel on the surface of a tooth.

**foundation hospitals** *see* **FOUNDATION TRUSTS**.

**Foundation Programme** a two-year programme of postgraduate medical training, introduced as part of the **Modernizing Medical Careers** initiative in 2005. Foundation year 1 replaced the old preregistration house officer year, and foundation year 2 replaced the first year of senior house officer training. *See also* **DOCTOR**.

**foundation training (dental foundation training, DFT)** a period of supervised training for dentists in general practice before they are allowed to work independently in the NHS. Foundation training is undertaken after graduation from dental school and lasts 1–2 years. In Scotland it is known as **vocational training**.

**foundation trusts (foundation hospitals)** self-governing NHS organizations established under the Health and Social Care Act 2003. Foundation trusts were intended to be accountable to their local communities and **\*NHS Improvement** rather than to central government, while remaining subject to inspection by the **\*Care Quality Commission** in the same way as other health-care providers. In recent years, however, many foundation trusts have required additional government funding due to financial deficits, with the result that central government has regained a large degree of financial and planning control. In practice, few differences now remain between foundation trusts and other NHS acute trusts.

**Fourier domain OCT** *see* **SPECTRAL DOMAIN OPTICAL COHERENCE TOMOGRAPHY**.

**four-layer system** a continuous compression bandage consisting of four layers that are applied and left in situ for up to seven days to treat venous leg ulcers, increasing the chance of healing by up to 30%. Thorough assessment of the patient's status must be undertaken before the application.

**Fournier's gangrene** a rare but potentially life-threatening infection of the scrotum that can rapidly spread to involve the perineum, penis, and anterior abdominal wall. [J. A. Fournier (19th century), French venereologist]

**four principles** an approach to medical ethics, proposed by Tom Beauchamp and James F. Childress, that identifies four basic tenets of ethical practice, namely: respect for *\*autonomy*, *\*beneficence*, *\*nonmaleficence*, and *\*justice*. Although the four principles are often used as a framework for decision-making in Western medical ethics, there may be problems when principles conflict or their application is contested in practice.

**fovea** *n.* (in anatomy) a small depression, especially the shallow pit in the retina at the back of the eye. It contains a large number of *\*cones* and is therefore the area of greatest acuity of vision: when the eye is directed at an object, the part of the image that is focused on the fovea is the part that is most accurately registered by the brain. *See also* **MACULA**.

**foveola** *n.* (in anatomy) a small depression.

**FPL test** *see* **FORCED PREFERENTIAL LOOKING TEST**.

**fractional flow reserve (FFR)** a technique used to quantify the severity of a coronary artery narrowing. During *\*cardiac* catheterization, a specialized wire is passed down the coronary artery to measure pressure. The ratio of the pressure measured downstream of the narrowing to the pressure measured upstream is derived (this ratio also applies to coronary flow). When the ratio is below a certain threshold, flow restriction by the narrowing is deemed to be significant and *\*percutaneous* coronary intervention is likely to be beneficial.

**fracture** *n.* breakage of a bone, either complete or incomplete. A **simple fracture** involves a **clean** break with little damage to surrounding tissues and no break in the overlying skin. If the overlying skin is perforated and there is a wound extending to the fracture site, the fracture is **open**, and there is a risk of infection (*see* **OSTEOMYELITIS**). Treatment of a simple fracture includes realignment of the bone ends where there is displacement, immobilization by external splints or internal fixation, followed by *\*rehabilitation*. *See also* **COLLES' FRACTURE**; **COMMINUTED FRACTURE**; **GREENSTICK**

FRACTURE; PATHOLOGICAL FRACTURE; SCAPHOID FRACTURE; SMITH'S FRACTURE; STRESS FRACTURE.

**fraenectomy (frenectomy, frenulectomy, frenotomy)** *n.* an operation to remove the fraenum, including the underlying fibrous tissue.

**fraenum (frenum, frenulum)** *n.* **1.** any of the folds of mucous membrane under the tongue or between the gums and the upper or lower lips. **2.** any of several other structures of similar appearance.

**fragile-X syndrome** a major genetic disorder caused by a constriction near the end of the long arm of an **\*X chromosome**: it is inherited as an X-linked **\*dominant** characteristic. The fragile-X syndrome is second only to **\*Down's syndrome** as a cause of learning disability. Affected males have unusually high foreheads, unbalanced faces, large jaws, long protruding ears, and large testicles. They have an IQ below 50 and are prone to violent outbursts. Folic acid helps to control their behaviour. About one-third of the females with this mutation on one of their two X chromosomes also show developmental delay. Screening for the characteristic chromosome can be done by **\*amniocentesis** or **\*chorionic villus sampling**.

**fragilitas** *n.* abnormal brittleness or fragility, for example of the hair (**fragilitas crinium**) or the bones (**fragilitas ossium**; *see* **OSTEOGENESIS IMPERFECTA**).

**framboesia** *n.* *see* **YAWS**.

**Framingham risk score** an assessment tool that predicts a ten-year risk of developing cardiovascular disease based on gender, age, total and HDL cholesterol, blood pressure, and smoking, thereby enabling preventative treatment. It does not incorporate the presence of diabetes or familial history of cardiovascular disease into the scoring.

**framycetin** *n.* an antibiotic used mainly in the form of eye or ear drops (in combination with dexamethasone) to treat eye and ear infections.

**Fraser guidelines** *see* **GILICK COMPETENCE**.

**fraternal twins** *see* **TWINS**.

**freckle** *n.* a small brown spot on the skin commonly found on exposed areas of red-haired or blond people. Freckles, which are harmless, appear where there is excessive production of the pigment melanin without any increase in numbers of melanocytes after exposure to sunlight. *Compare* LENTIGO.

**free association** (in \*psychoanalysis) a technique in which the patient is encouraged to pursue a particular train of ideas as they enter consciousness. *See also* ASSOCIATION OF IDEAS.

**free field audiogram** *see* AUDIOGRAM.

**free-floating anxiety** an all-pervasive unfocused fear that is not produced by any appropriate cause or attached to any particular idea. Such anxiety is a feature of the \*generalized anxiety disorder.

**free gas** the radiographic finding of gas where it would not normally be expected, particularly in the peritoneal cavity. It is typically associated with perforation of a hollow organ containing gas, usually the bowel.

**freeze drying** a method for the \*fixation of histological specimens, involving a minimum of chemical and physical change. Specimens are immersed in isopentane cooled to  $-190^{\circ}\text{C}$  in liquid air. This fixes the tissue instantly, without the formation of large ice crystals (which would cause structural changes). The tissue is then dehydrated in a vacuum for about 72 hours at  $-32.5^{\circ}\text{C}$ .

**freeze etching** a technique for preparing specimens for electron microscopy. The unfixed tissue is frozen and then split with a knife and a layer of ice is sublimed from the exposed surface. The resultant image is thus not distorted by chemical fixatives.

**Frei test** a rarely used diagnostic test for the sexually transmitted disease \*lymphogranuloma venereum. A small quantity of the virus, inactivated by heat, is injected into the patient's skin. If the disease is present a small red swelling appears at the site of injection within 48 hours. [W. S. Frei (1885–1943), German dermatologist]

**fremitus** *n.* vibrations or tremors in a part of the body, detected by feeling with the fingers or hand (\*palpation) or by listening (\*auscultation). The term is most commonly applied to vibrations perceived through the chest when a

patient breathes, speaks (**vocal fremitus**), or coughs. The nature of the fremitus gives an indication as to whether the chest is affected by disease. For example, loss of vocal fremitus suggests the presence of fluid in the pleural cavity; its increase suggests consolidation of the underlying lung.

**frenuloplasty** *n.* a surgical procedure performed to loosen the fold of skin on the underside of the penis (frenulum), which connects the glans to the prepuce, when this is abnormally tight.

**frenulum** *n.* *see* **FRAENUM**.

**frenum** *n.* *see* **FRAENUM**.

**frequency** *n.* (of urine) the passage of urine more than six or seven times a day: a **\*lower urinary tract symptom** that usually indicates genitourinary disorders and diseases but also accompanies **\*polyuria**.

**frequency distribution** (in statistics) a presentation in the form of a table or graph of the number of times that the categories of a categorical variable (e.g. sex) occur in a sample of observations. *See* **DISTRIBUTION**.

**Fresnel prism** a flexible plastic prism that can be stuck to spectacle lenses to add a prism effect to spectacles. It may be used to correct double vision. [A. J. Fresnel (1788–1827), French physicist]

**Freudian** *adj.* relating to or describing the work and ideas of Austrian psychiatrist Sigmund Freud (1856–1939), inventor of psychoanalytic theory: applied particularly to the school of psychiatry based on his teachings (*see* **PSYCHOANALYSIS**).

**friction murmur (friction rub)** a scratching sound, heard over the heart with the aid of the stethoscope, in patients who have **\*pericarditis**. It results from the two inflamed layers of the pericardium rubbing together during activity of the heart.

**Friedreich's ataxia** *see* **ATAXIA**. [N. Friedreich (1825–82), German neurologist]

**fringe medicine** *see* **COMPLEMENTARY MEDICINE**.

**Fröhlich's syndrome** a disorder of the *\*hypothalamus* (part of the brain) affecting males: the boy is overweight with sexual development absent and disturbances of sleep and appetite. Medical name: **dystrophia adiposogenitalis**. [A. Fröhlich (1871–1953), Austrian neurologist]

**Froin's syndrome** a condition in which the cerebrospinal fluid (CSF) displays a combination of yellow colour and high protein content. It is characteristic of a block to the spinal circulation of CSF often caused by a tumour. [G. Froin (1874–1932), French physician]

**frontal** *adj.* **1.** of or relating to the forehead (*see* **FRONTAL BONE**). **2.** denoting the *\*anterior* part of a body or organ.

**frontal bone** the bone forming the forehead and the upper parts of the orbits; it contains several air spaces (**frontal sinuses**: *see* **PARANASAL SINUSES**). At birth it consists of right and left halves, joined by a suture that usually closes during infancy. *See* **SKULL**.

**frontal lobe** the anterior part of each cerebral hemisphere (*see* **CEREBRUM**), extending as far back as the deep central sulcus (cleft) of its upper and outer surface. Immediately anterior to the central sulcus lies the motor cortex, responsible for the control of voluntary movement; the area further forward – the *\*prefrontal lobe* – is concerned with behaviour, learning, judgment, and personality.

**frontal sinus** *see* **PARANASAL SINUSES**.

**frontotemporal dementia (FTD)** a relatively rare neurodegenerative disease characterized by progressive loss of neurons predominantly involving the frontal and/or temporal lobes. First described by Arnold Pick in 1892, it was originally called **Pick's disease**. Common symptoms include significant changes in social and personal behaviour, *\*abulia*, blunting of emotions, and language deficits. Compared with *\*Alzheimer's disease*, a younger population is affected (age 55–65) and more cases have a genetic cause.

**frostbite** *n.* damage to the tissues caused by freezing. The affected parts, usually the nose, fingers, or toes, become pale and numb. Ice crystals form in the tissues, which may thus be destroyed, and amputation may become

necessary. Frostbitten parts should not be rubbed, since there is no blood circulation in the tissues, but they may be gently warmed in tepid water. Precautions must be taken against bacterial infection, to which frostbitten skin is highly susceptible.

**frozen shoulder (adhesive capsulitis)** a well-defined disorder characterized by progressive pain and then stiffness of the shoulder that has no clear single cause and usually resolves spontaneously over about 18 months. It may occur after trauma and is more common with diabetes mellitus. Initial treatment during the painful inflammatory phase is with analgesics and anti-inflammatory drugs. During the stiff phase, when the pain and inflammation has settled, gentle physiotherapy and possible manipulation under anaesthesia is performed to help regain range of motion.

**frozen watchfulness** the state of a child who is unresponsive to its surroundings but is clearly aware of them. The child is usually expressionless and difficult to engage but of normal intelligence. Frozen watchfulness is usually a marker of *\*child abuse*.

**fructose** *n.* a simple sugar found in honey and in such fruit as figs. Fructose is one of the two sugars in *\*sucrose*. Fructose from the diet can be used to produce energy by the process known as *\*glycolysis*, which takes place in the liver. Fructose is important in the diet of diabetics since, unlike glucose, fructose metabolism is not dependent on insulin.

**fructosuria (levulosuria)** *n.* the presence of fructose (levulose) in the urine.

**frusemide** *n.* *see* **FUROSEMIDE**.

**FSGS** *see* **FOCAL SEGMENTAL GLOMERULOSCLEROSIS**.

**FSH** *see* **FOLLICLE-STIMULATING HORMONE**.

**FTD** *see* **FRONTOTEMPORAL DEMENTIA**.

**FTR** *see* **FALLOPIAN TUBE RECANALIZATION**.

**FTT** *see* **FAILURE TO THRIVE**.

**5FU** *n.* *see* **FLUOROURACIL**.

**Fuchs' endothelial dystrophy** a hereditary condition in which the corneal endothelium loses its functional ability, usually with age. It may result in thickening and swelling of the cornea (**\*bullous keratopathy**) and thus affect vision. **Cornea guttata**, small whitish deposits of hyalin, are seen on the inner surface of the cornea and signify a reduced number of endothelial cells. A corneal transplantation (*see* **KERATOPLASTY**) may become necessary in certain cases. [E. Fuchs (1851–1913), German ophthalmologist]

**Fuchs' heterochromic cyclitis** a condition characterized by chronic low-grade inflammation of the ciliary body and iris (anterior **\*uveitis**) with depigmentation of the affected iris (**\*heterochromia**). Glaucoma and cataract can develop in the affected eye.

**fuchsin (magenta)** *n.* any one of a group of reddish to purplish dyes used in staining bacteria for microscopic observation and capable of killing various disease-causing microorganisms. **Acid fuchsin (acid magenta)** is a mixture of sulphonated fuchsins; **basic fuchsin (basic magenta)** and **new (trimethyl) fuchsin** are basic histological dyes (basic fuchsin is also an antifungal agent).

**Fuchs' spots** pigmented lesions in the macular area of the retina that are seen in severely myopic (short-sighted) individuals. They are breaks in **\*Bruch's membrane** allowing choroidal **\*neovascularization** and can result in reduced vision. [E. Fuchs]

**-fuge** *combining form denoting* an agent that drives away, repels, or eliminates. Example: **febrifuge** (a drug that reduces fever).

**fugue** *n.* a period of memory loss during which the patient leaves his or her usual surroundings and wanders aimlessly. It is often preceded by psychological conflict and associated with depression (*see* **DISSOCIATIVE DISORDER**), organic mental disease, or alcoholism.

**fulguration (electrodesiccation)** *n.* the destruction with a **\*diathermy** instrument of warts, growths, or unwanted areas of tissue, particularly inside the bladder. This latter operation is performed via the urethra and viewed through a cystoscope.

**fulminating (fulminant, fulgurant)** *adj.* describing a condition or symptom that is of very sudden onset, severe, and of short duration.

**fumigation** *n.* the use of gases or vapours to bring about \*[disinfestation](#) of clothing, buildings, etc. Sulphur dioxide, formaldehyde, and chlorine are common fumigating agents.

**functional disorder** a condition in which a patient complains of symptoms for which no physical cause can be found. Such a condition is frequently an indication of a psychiatric disorder. *Compare* [ORGANIC DISORDER](#).

**functional endoscopic sinus surgery (FESS)** *see* [ENDOSCOPIC SINUS SURGERY](#).

**functional foods** natural or processed foods that contain a known biologically active component that gives clinically proven health benefits in addition to the traditional nutrient value. For example, stanols and sterols added to margarine-type spreads lower cholesterol. *See also* [PREBIOTICS](#); [PROBIOTICS](#).

**Functional Independence Measure (FIM)** a table recommended by the WHO for assessing the degree of whole-person disability, being particularly useful for judging the extent of recovery from serious injury. It has five grades, ranging from 0 (fully independent) to 4 (completely dependent).

**functional magnetic resonance imaging (fMRI)** a type of \*[magnetic resonance imaging](#) that measures the increased hemodynamic response seen with neural activity in the brain or spinal cord. fMRI has allowed major advances in **brain mapping** (i.e. matching sections of the brain with particular behaviours, thoughts, or emotions).

**Functional Recovery Index** an international index, published by the World Health Organization, that grades the degree of recovery after serious injury.

**functional seizure** *see* [NON-EPILEPTIC SEIZURE](#).

**fundal height** (**symphysis–fundal height**) the distance, measured in centimetres, from the top of the symphysis pubis to the highest point in the midline at the top of the uterus (fundus). It is measured at each antenatal visit to assess fetal growth and development during pregnancy. *See* [FETAL GROWTH CHART](#).

**fundoplication** *n.* a surgical operation for \*gastro-oesophageal reflux disease in which the upper part of the stomach is wrapped around the lower oesophagus. **Nissen fundoplication** (named after Swiss surgeon Rudolf Nissen, 1896–1981) consists of a complete (360-degree) wrap; **toupe fundoplication** is a partial (270-degree) wrap. Fundoplication is now more often performed laparoscopically than via open surgery.

**fundoscopy (ophthalmoscopy)** *n.* examination of the interior of the eye by means of an \*ophthalmoscope.

**fundus** *n.* **1.** the base of a hollow organ: the part farthest from the opening; e.g. the fundus of the stomach, bladder, or uterus. **2.** the interior concavity forming the back of the eyeball, opposite the pupil. **Fundus flavimaculatus** is a hereditary disease of the retina in which white material is deposited in the fundus at the level of the retinal pigment epithelium (*see* RETINA). It usually causes loss of central vision, but good vision may persist into adulthood. **Fundus albipunctatus** is a hereditary disease in which the fundus shows widespread distribution of uniform-sized white dots, resulting in poor \*dark adaptation.

**fungating** *adj.* describing or relating to a mass of malignant tissue that has infiltrated the epithelium and broken through the skin surface. Often in the shape of a fungus, it may be infected, smell strongly, and cause pain and is most likely to occur in the advanced stages of cancer, particularly of the breast, head, or neck.

**fungicide** *n.* an agent that kills fungi. *See also* ANTIFUNGAL.

**fungoid** **1.** *adj.* resembling a fungus. **2.** *n.* a fungus-like growth.

**fungus** *n.* (*pl.* **fungi**) a simple organism (formerly regarded as a plant) that lacks the green pigment chlorophyll. Fungi include the \*yeasts, rusts, moulds, and mushrooms. They live either as \*saprophytes or as \*parasites of plants and animals; some species infect and cause disease in humans. Some yeasts are a good source of vitamin B and many antibiotics are obtained from the moulds (*see* PENICILLIN). —**fungal** *adj.*

**funiculitis** *n.* inflammation of the spermatic cord. This usually arises in association with \*epididymitis and causes pain and swelling of the involved

cord. Treatment is by administration of antibiotics and analgesics.

**funiculus** *n.* **1.** any of the three main columns of white matter found in each lateral half of the spinal cord. **2.** a bundle of nerve fibres enclosed in a sheath; a fasciculus. **3.** (formerly) the spermatic cord or umbilical cord.

**funis** *n.* (in anatomy) any cordlike structure, especially the umbilical cord.

**funnel chest** depression of the breastbone and inward curving of the costal cartilages articulating with it, resulting in deformity of the chest. It may displace the heart to the left and can cause slight breathlessness. Medical name: **pectus excavatum**.

**furcation** *n.* the location on a multi-rooted tooth where branching occurs.

**furosemide (frusemide)** *n.* a loop **\*diuretic** used to treat fluid retention (oedema) associated with heart failure or kidney disease and also sometimes to treat high blood pressure. Common side-effects are nausea and vomiting.

**furuncle** *n.* *see* **BOIL**.

**furunculosis** *n.* the occurrence of several **\*boils** (furuncles) at the same time, usually caused by *Staphylococcus aureus* infection. Treatment includes thorough daily disinfection of the skin and incision (lancing), which may be more effective than antibiotic therapy. Diabetes mellitus should be excluded.

**fusidic acid** a steroid antibiotic used to treat skin and eye infections caused by staphylococci. It may cause hypersensitivity reactions. *See also* **SODIUM FUSIDATE**.

**fusiform** *adj.* spindle-shaped; tapering at both ends.

**fusion** *n.* the joining together of two structures. For example, the surgical fusion of two or more vertebrae is performed to stabilize an unstable spine. Fusion of the **\*epiphyses** during growth is the cause of arrested growth of stature.

**fusion imaging** *see* **CO-REGISTRATION**.

**Fusobacterium** *n.* a genus of Gram-negative rodlike bacteria with tapering ends. Most species are normal inhabitants of the mouth of animals and

humans and produce no harmful effects, but anaerobic *Fusobacterium* species are associated with \*ulcerative gingivitis.

**futile** *adj.* describing an intervention with little or no prospect of achieving its aim or intended purpose, often used to justify withholding or withdrawing medical treatment at the end of life. Claims that treatment is futile may be controversial because of the inherent uncertainty of prognoses, value judgments about quality of life, and contested therapeutic aims. Intensive care, for example, cannot be said to be futile simply on the grounds that the patient is unlikely to regain full health, since restoration of full health was never the intended purpose. —**futility** *n.*

**GABA** *see* **GAMMA-AMINOBUTYRIC ACID**.

**gabapentin** *n.* an **\*anticonvulsant** drug used to treat partial **\*epilepsy** and neuropathic pain, including **\*peripheral neuropathy** and postherpetic **\*neuralgia**. Side-effects include gastrointestinal disturbances, dizziness, drowsiness, and shaky movements. **Pregabalin** (Lyrica) has similar uses and effects; it is also licensed to treat generalized anxiety disorder.

**GAD** *see* **GLUTAMIC ACID DECARBOXYLASE**.

**GAD-7 (Generalized Anxiety Disorder Questionnaire)** a self-administered screening tool designed to identify people who may suffer from anxiety disorders. Its seven questions are based on DSM diagnostic criteria for anxiety disorders. Each item is scored from 0 (not at all) to 3 (nearly every day). Scores of 5, 10, and 15 are taken as the cut-off points for mild, moderate, and severe anxiety, respectively. A score of 10 indicates a reasonably high likelihood of **\*generalized anxiety disorder**.

**GAD antibodies** *see* **ISLET CELL ANTIBODIES**.

**Gaffkya** *n.* a genus of bacteria now classified as **\*Micrococcus**.

**gag** *n.* (in medicine) an instrument that is placed between a patient's teeth to keep his or her mouth open.

**gag reflex (pharyngeal reflex)** a normal reflex action caused by contraction of pharynx muscles when the soft palate or posterior pharynx is touched. The reflex is used to test the integrity of the **\*glossopharyngeal** and **\*vagus nerves**.

**galact- (galacto-)** *combining form denoting* **1.** milk. Example: **galactosis** (formation of). **2.** galactose.

**galactagogue** *n.* an agent that stimulates the secretion of milk or increases milk flow.

**galactoceles** *n.* **1.** a breast cyst containing milk, caused by closure of a milk duct. **2.** an accumulation of milky liquid in the sac surrounding the testis (see **HYDROCELE**).

**galactorrhoea** *n.* pathological secretion of breast milk by women or men, usually as a result of a benign pituitary tumour (see **PROLACTINOMA**).

**galactosaemia** *n.* an inborn inability to utilize the sugar galactose, which in consequence accumulates in the blood. It is inherited as an autosomal **\*recessive** characteristic. Untreated, affected infants fail to thrive and show developmental delay, but if galactose is eliminated from the diet growth and development may be normal.

**galactose** *n.* a simple sugar and a constituent of the milk sugar **\*lactose**. Galactose is converted to glucose in the liver. The enzyme necessary for this is missing in infants with the rare metabolic disease **\*galactosaemia**.

**galanin** *n.* a peptide hormone that has widespread effects on the central and peripheral nervous system and the gut. It is associated with the regulation of sleep, blood pressure, mood, and feeding, as well as response to pain, physiological growth, and cognition.

**galantamine** *n.* see **ACETYLCHOLINESTERASE INHIBITOR**.

**galea** *n.* **1.** a helmet-shaped part, especially the **galea aponeurotica**, a flat sheet of fibrous tissue (see **APONEUROSIS**) that caps the skull and links the two parts of the **\*epicranium** muscle. **2.** a type of head bandage.

**galenical** *n.* a pharmaceutical preparation of a drug of animal or plant origin.

**gall bladder** a pear-shaped sac (7–10 cm long), lying underneath the right lobe of the liver, in which **\*bile** is stored (see illustration overleaf). Bile passes (via the common hepatic duct) to the gall bladder from the liver, where it is formed, and is released into the duodenum (through the common bile duct) under the influence of the hormone **\*cholecystikinin**, which is secreted when food is present in the duodenum. The gall bladder is a common site of stone formation (see **GALLSTONE**).

**The gall bladder.** Showing details of associated ducts.

**gallium** *n.* a silvery metallic element. A radioisotope of gallium can be used with **\*nuclear medicine** techniques for the detection of lymphomas and areas of infection (such as an abscess) following intravenous injection. This technique is being replaced by other methods of imaging with lower radiation doses and better anatomical resolution.

**gallop rhythm (triple rhythm)** a third heart sound, which in association with a fast heart rate resembles the sound of a galloping horse. It is a sign of left ventricular failure (*see* **HEART FAILURE**).

**gallstone** *n.* a hard mass composed of bile pigments, cholesterol, and calcium salts, in varying proportions, that can form in the gall bladder. The formation of gallstones (**cholelithiasis**) occurs when the physical characteristics of bile alter so that cholesterol is less soluble or there is an excess of bile pigments. Diminished contractility of the gall bladder may also be a contributory factor, leading to biliary stasis. Gallstones may exist for many years without causing symptoms. However, they may cause severe pain (*see* **BILIARY COLIC**) or they may pass into the common bile duct and cause obstructive **\*jaundice** or **\*cholangitis**. Gallstones are usually diagnosed by ultrasonography, but those containing calcium may be seen on a plain X-ray (opaque stones). Symptomatic cholelithiasis is usually treated by surgical removal of the gall bladder (*see* **CHOLECYSTECTOMY**). Nonsurgical

treatments, such as gallstone-dissolving drugs or lithotripsy, have proved less successful and are not in widespread use.

**galvanism** *n.* (formerly) any form of medical treatment using electricity. **Interrupted galvanism** is a form of *\*electrotherapy* in which direct current, in impulses lasting for 30 to 100 milliseconds, is used to stimulate the activity of nerves or the muscles they supply. *See also* **FARADISM**.

**gamekeeper's thumb** *see* **SKIER'S THUMB**.

**gamete** *n.* a mature sex cell: the *\*ovum* of the female or the *\*spermatozoon* of the male. Gametes are haploid, containing half the normal number of chromosomes.

**gamete intrafallopian transfer (GIFT)** a procedure for assisting conception, suitable only for women with healthy Fallopian tubes. In over 50% of women in whom infertility is diagnosed, the tubes are normal but some other factor, such as endometriosis, prevents conception. Using needle *\*aspiration*, under laparoscopic or ultrasonic guidance, ova are removed from the ovary. After being mixed with the partner's spermatozoa, they are introduced into a Fallopian tube, where fertilization takes place. The fertilized ovum can subsequently become implanted in the uterus.

**gametocide** *n.* a drug that kills *\*gametocytes*. Drugs such as *\*primaquine* destroy gametocytes of the malaria parasite (*see* **PLASMODIUM**), so interrupting the life cycle and preventing infection of the mosquito.

**gametocyte** *n.* any of the cells that are in the process of developing into gametes by undergoing *\*gametogenesis*. *See also* **OOCYTE**; **SPERMATOCYTE**.

**gametogenesis** *n.* the process by which spermatozoa and ova are formed. In both sexes the precursor cells undergo *\*meiosis*, which halves the number of chromosomes. However, the timing of events and the size and number of gametes produced are very different in the male and female. *See* **OOGENESIS**; **SPERMATOGENESIS**.

**gaming disorder** a pattern of behaviour characterized by impaired control over digital gaming, increased priority given to gaming over other interests and activities, and continuation or escalation of gaming despite negative consequences. For gaming disorder to be diagnosed, the behaviour pattern

must be of sufficient severity to result in significant impairment of personal, family, social, educational, occupational, or other important areas of functioning and would normally have been evident for at least 12 months. Gaming disorder was first introduced as a diagnostic entity in ICD-11 in 2018. It is estimated that around 2% of people who regularly play digital games are affected. Treatment follows the principles of other [\\*addiction](#) treatments.

**gamma-aminobutyric acid (GABA)** an amino acid found in the central nervous system, predominantly in the brain, where it acts as an inhibitory [\\*neurotransmitter](#).

**gamma camera** an apparatus that detects gamma rays emitted by radioactive isotopes that have been introduced into the body as [\\*tracers](#). It contains an activated sodium iodide crystal (see [SCINTILLATOR](#)) and a large array of photomultiplier tubes. Using lead [\\*collimators](#), the position of the source of the radioactivity can be plotted and displayed on a TV monitor or photographic film (see [SCINTIGRAM](#)).

**gammaglobulin** any of a class of proteins, present in the blood [\\*plasma](#), identified by their characteristic rate of movement in an electric field (see [ELECTROPHORESIS](#)). Almost all gammaglobulins are [\\*immunoglobulins](#). Injection of gammaglobulin provides temporary protection against [\\*hepatitis A](#) and reduces the incidence of coronary artery involvement in [\\*Kawasaki disease](#). Infusions of gammaglobulin are used to treat immunodeficiencies or immune-mediated disorders, such as autoimmune haemolytic [\\*anaemia](#) or [\\*idiopathic thrombocytopenic purpura](#). See also [GLOBULIN](#).

**gamma knife** a device that allows high doses of radiation in the form of gamma rays to be accurately focused on pathological tissue, with less risk of damaging adjacent normal tissue compared with conventional radiotherapy. Multiple cobalt-60 sources deliver the gamma irradiation. The device is used in the treatment of vestibular schwannomas, certain brain tumours, vascular lesions of the brain, trigeminal neuralgia, and some forms of epilepsy.

**gamma rays** ionizing electromagnetic radiation of short wavelength given off by certain radioactive substances with equivalent properties to artificially produced X-rays. Gamma rays used in [\\*nuclear medicine](#) tend to have higher

energy than diagnostic X-rays, with greater penetration; they are harmful to living tissues and can be used to sterilize certain materials and to kill bacteria as a means of food preservation. Higher energies are used in *\*radiotherapy* with sufficient energy to kill tumour cells by causing breaks in DNA strands.

**gamo-** *combining form denoting marriage.*

**ganciclovir** *n.* an antiviral drug used to treat severe *\*cytomegalovirus* (CMV) infections, including CMV retinitis, in immunocompromised patients and also *\*dendritic ulcers*. Possible side-effects include nausea, vomiting, diarrhoea, infertility, confusion, seizures, and disturbance of bone marrow blood-cell production.

**gangli-** (**ganglio-**) *combining form denoting a ganglion.*

**ganglion** *n.* (*pl.* **ganglia**) **1.** (in neurology) any structure containing a collection of nerve cell bodies and often also numbers of synapses. In the *\*sympathetic nervous system* chains of ganglia are found on each side of the spinal cord, while in the *\*parasympathetic system* ganglia are situated in or nearer to the organs innervated. Swellings in the posterior sensory *\*roots* of the spinal nerves are termed ganglia; these contain cell bodies but no synapses. Within the central nervous system certain well-defined masses of nerve cells are called ganglia (or **nuclei**); for example, the *\*basal ganglia*. **2.** an abnormal but harmless swelling (cyst) that sometimes forms in tendon sheaths, especially at the wrist.

**ganglioside** *n.* one of a group of *\*glycolipids* found in the brain, liver, spleen, and red blood cells (they are particularly abundant in nerve cell membranes). Gangliosides are chemically similar to *\*cerebrosides* but contain additional carbohydrate groups.

**gangosa** *n.* a lesion that occasionally appears in the final stage of *\*yaws*, involving considerable destruction of the tissues of both the hard palate and the nose.

**gangrene** *n.* death and decay of part of the body due to deficiency or cessation of blood supply. The causes include disease, injury, or *\*atheroma* in major blood vessels, frostbite or severe burns, and diseases such as *\*diabetes mellitus* and *\*Raynaud's disease*. **Dry gangrene** is death and

withering of tissues caused simply by a cessation of local blood circulation. **Moist gangrene** (also known as **wet gangrene**) is death and putrefactive decay of tissue caused by bacterial infection. *See also* [GAS GANGRENE](#).

**Ganser syndrome** a syndrome characterized by approximate answers, i.e. the patient gives grossly and absurdly false replies to questions, but the reply shows that the question has been understood. For example, the question “What colour is snow?” may elicit the reply “Green”. This can be accompanied by odd behaviour or episodes of *\*stupor*. The condition may be due to *\*conversion disorder* or to conscious malingering, especially (historically) in prisoners. [S. J. M. Ganser (1853–1931), German psychiatrist]

**Gardner–Diamond syndrome (painful bruising syndrome, psychogenic purpura)** a rare disorder, characterized by unexplained, recurrent, and painful bruising, typically arising after physical and/or psycho-emotional stress. Classically, ecchymoses spontaneously appear and are associated with a prodrome of warmth and pain at the sites. The condition, which is seen primarily in young to middle-aged women, is induced by trauma and associated with *\*personality disorders*. Research into the syndrome is sparse but recent publications suggest that only a minority of patients experience a serious reduction in their quality of life, that the condition seems to be dermal rather than systematic in most patients, and that it seems to be associated with ongoing stress. [L. K. Diamond (1902–1999), US paediatrician; F. H. Gardner (1919–2013), US haematologist]

**Gardnerella** *n.* a genus of anaerobic bacteria. *G. vaginalis* is a cause of *\*bacterial vaginosis* and vaginitis and, in pregnant women, of late miscarriage and premature labour.

**Gardner’s syndrome** a variant form of familial adenomatous *\*polyposis* in which polyps in the colon are associated with fibromas, *\*sebaceous cysts*, and *\*osteomas* (benign tumours), especially of the skull and jaw. [E. J. Gardner (1909–89), US physician]

**gargoylism** *n.* *see* [HUNTER’S SYNDROME](#); [HURLER’S SYNDROME](#).

**Gartner’s duct cysts** vaginal cysts, usually small, that arise from **Gartner’s duct** – remnants of the Wolffian duct (*see* [MESONEPHROS](#)) in females. No

treatment is necessary if the cysts are small and not symptomatic, but surgical **\*marsupialization** or excision may be required if they are large and cause obstruction. [H. T. Gartner (1785–1827), Danish surgeon and anatomist]

**gas gangrene** death and decay of wound tissue infected by the soil bacterium **\*Clostridium perfringens**. Toxins produced by the bacterium cause putrefactive decay of connective tissue with the generation of gas. Treatment is usually by surgery.

**Gasterophilus** *n.* a genus of widely distributed non-bloodsucking beelike flies. The parasitic maggots normally live in the alimentary canal of horses but, rarely, can also infect humans and cause an inflamed itching eruption of the skin (see **CREeping ERUPTION**).

**gastr-** (**gastro-**) *combining form denoting* the stomach. Examples: **gastrocolic** (relating to the stomach and colon); **gastrointestinal** (relating to the stomach and intestines).

**gastrectasia** *n.* pathological dilatation of the stomach. This may be caused by gastric outlet obstruction or it may occur as a complication of previous abdominal surgery, trauma, or overeating.

**gastrectomy** *n.* a surgical operation in which the whole or a part of the stomach is removed. **Total gastrectomy**, in which the oesophagus is joined to the jejunum, is usually performed for stomach cancer but occasionally for the **\*Zollinger-Ellison syndrome**. In **partial** (or **subtotal**) **gastrectomy** the upper part of the stomach is joined to the duodenum or small intestine (**gastroenterostomy**); this operation (with vagotomy) was the definitive treatment for refractory peptic ulcer before the advent of **\*antisecretory drugs**. It is still performed in the treatment of gastric antral disease. After gastrectomy capacity for food is reduced, sometimes leading to weight loss. Other complications of gastrectomy include **\*dumping syndrome**, ulceration at the anastomosis, anaemia, and **\*malabsorption**.

**gastric** *adj.* relating to or affecting the stomach.

**gastric banding** a form of **\*bariatric surgery** in which a band is placed around the stomach to effectively reduce its size and therefore restrict the amount of food it can accommodate. Weight loss should result. The procedure can be performed either in open operation or laparoscopically.

The bands can be of a fixed size or adjustable (to vary calorie intake) by means of a small reservoir situated under the skin into which fluid can be injected or removed by the patient.

**gastric bypass surgery** any of several procedures of **\*bariatric surgery** that allow food to bypass parts of the gut in order to reduce absorption of nutrients and calories. Such operations often lead to greater weight loss than restrictive procedures, such as **\*gastric banding** and **\*stomach stapling**, but there are significant long-term complications relating to chronic malabsorption and patients must remain under long-term specialist follow-up.

**gastric glands** tubular glands that lie in the mucous membrane of the stomach wall. There are three varieties: the **cardiac**, **parietal (oxyntic)**, and **pyloric glands**, and they secrete **\*gastric juice**.

**gastric juice** the liquid secreted by the **\*gastric glands** of the stomach. Its main digestive constituents are hydrochloric acid, mucin, **\*rennin**, and pepsinogen. The acid acts on pepsinogen to produce **\*pepsin**, which functions best in an acid medium. The acidity of the stomach contents also kills unwanted bacteria and other organisms that have been ingested with the food. Gastric juice also contains **\*intrinsic factor**, which is necessary for the absorption of vitamin B<sub>12</sub>.

**gastric stapling** *see* **STOMACH STAPLING**.

**gastric ulcer** an ulcer in the stomach, caused by the action of gastric acid and pepsin, on the stomach lining (mucosa). The output of stomach acid is not usually increased. Taking **\*NSAIDs** (nonsteroidal anti-inflammatory drugs) and the presence of **\**Helicobacter pylori*** are important predisposing factors. Symptoms include vomiting and pain in the upper abdomen soon after eating, and such complications as bleeding (*see also* **HAEMATEMESIS**), **\*perforation**, and obstruction due to scarring may occur. Symptoms are relieved by antacid medicines, but most ulcers heal if treated by an **\*antisecretory drug**. Surgery may be required if the ulcer fails to heal. Since stomach cancer may mimic a gastric ulcer, all gastric ulcers should be examined at endoscopy and biopsies should be taken for histopathological analysis.

**gastrin** *n.* a hormone produced in the mucous membrane of the pyloric region of the stomach (see **G-CELL**). Its secretion is stimulated by the presence of food. It is circulated in the blood to the rest of the stomach, where it stimulates the production of **\*gastric juice**.

**gastrinoma** *n.* a rare tumour that secretes the hormone gastrin, which stimulates excessive gastric acid production. Such tumours most frequently occur in the pancreas; about half of them are malignant. Patients present with intractable gastroduodenal ulceration, abdominal pain, and diarrhoea (the **\*Zollinger–Ellison syndrome**). Gastrinomas may be a feature of **\*MENS** type 1.

**gastritis** *n.* inflammation of the lining (mucosa) of the stomach. **Acute erosive (reactive) gastritis** is caused by ingesting excess alcohol, protracted NSAID use, or following major surgery, illness, or burns. **Chronic gastritis** is predominantly caused by **\*Helicobacter pylori** infection, but there are associations with smoking, chronic alcoholism, and biliary reflux. **Atrophic gastritis**, in which the stomach lining is atrophied, may complicate chronic gastritis or may occur secondary to **\*autoimmune disease**, often in association with pernicious anaemia, and is strongly associated with the development of gastric cancer.

**gastro-** *combining form.* See **GASTR-**.

**gastrocnemius** *n.* a muscle that forms the greater part of the calf of the leg (see illustration). It flexes the knee and foot (so that the toes point downwards).

**Gastrocnemius and soleus muscles.**

**gastrocolic reflex** a wave of peristalsis produced in the colon by introducing food into a fasting stomach.

**gastroduodenoscope** *n.* see GASTROSCOPE.

**gastroduodenoscopy** *n.* see OESOPHAGOGASTRODUODENOSCOPY.

**gastroduodenostomy** *n.* a surgical operation in which the \*duodenum (usually the third or fourth part) is joined to an opening made in the stomach in order to bypass an obstruction (such as \*pyloric stenosis) or to facilitate the exit of food from the stomach after vagotomy. Much more commonly a \*gastrojejunostomy or \*gastroenterostomy is performed. See also DUODENOSTOMY.

**gastroenteritis** *n.* inflammation of the stomach and intestine. It is usually due to acute viral or bacterial infection or to the ingestion of toxins in contaminated foods (see FOOD POISONING). Clinical symptoms are vomiting, diarrhoea, and fever. The illness usually lasts 3–5 days. Fluid loss is sometimes severe, especially at the extremes of age, and intravenous fluid replacement may be necessary. Viral or viral-type organisms (e.g. the \*norovirus) are common causes of highly infectious gastroenteritis and,

unlike bacterial pathogens, can be spread by aerosol or minimal contact and not necessarily by the faeco-oral route.

**gastroenterology** *n.* the study of gastrointestinal disease, which encompasses disease of any part of the digestive tract, the liver and biliary tract, and the pancreas.

**gastroenterostomy** *n.* a surgical operation in which the small intestine is joined to an opening made in the stomach. The usual technique is **\*gastrojejunostomy** to bypass obstruction (such as **\*pyloric stenosis**).

**Gastrografen** *n.* trade name for meglumine diatrizoate, a water-soluble **\*contrast medium** used in diagnostic radiology, usually in the gastrointestinal tract. It is used in some conditions as a laxative.

**gastroileac reflex** the relaxation of the **\*ileocaecal valve** caused by the presence of food in the stomach.

**gastrointestinal stromal tumour (GIST)** a rare type of sarcoma arising from the gastrointestinal tract (usually the stomach), characterized by the presence of the receptor c-kit/CD117 on the surface of the tumour cells, which stimulates division of these cells. It displays a wide range of malignant behaviour. Specific treatment is available with **\*tyrosine kinase inhibitors**.

**gastrojejunostomy** *n.* a surgical operation in which the **\*jejunum** is joined to an opening made in the stomach. This is usually done in preference to **\*gastroduodenostomy**. *See also* JEJUNOSTOMY.

**gastrolith** *n.* a stone in the stomach, which usually builds up around a **\*bezoar**.

**gastro-oesophageal reflux** the process in which the stomach contents transiently reflux into the oesophagus. Reflux is a normal process but pathological reflux (*see* **GASTRO-OESOPHAGEAL REFLUX DISEASE**) gives rise to symptoms and complications.

**gastro-oesophageal reflux disease (GORD)** a condition characterized by excessive **\*gastro-oesophageal reflux**, which occurs due to the impairment of neuromuscular mechanisms (such as the lower oesophageal sphincter) designed to minimize reflux. Symptoms range from **\*heartburn** and acid reflux

to difficulty or pain when swallowing, nocturnal cough, and chronic throat symptoms. Complications include erosive **\*oesophagitis**, oesophageal strictures, and the development of **\*Barrett's oesophagus**, a premalignant condition.

**gastro-oesophagostomy** *n.* a surgical operation in which the oesophagus (gullet) is joined to the stomach, bypassing the natural junction when this is obstructed by **\*achalasia**, **\*stricture** (narrowing), or cancer. This operation is rarely performed.

**gastroparesis** *n.* a condition in which the stomach fails to empty at an appropriate rate into the small intestine. Symptoms of bloating, nausea, early satiety, and vomiting are often intermittent in the early stages but can worsen to be a constant feature. It is most commonly seen in long-standing diabetes after the development of neuropathy affecting the parasympathetic nerves to the stomach.

**gastropexy** *n.* surgical attachment of the stomach to the abdominal wall.

**gastroplasty** *n.* surgical alteration of the shape of the stomach without removal of any part. The term was originally used for correction of an acquired deformity, e.g. narrowing due to a peptic ulcer, but has more recently been applied to techniques for reducing the size of the stomach in the treatment of morbid obesity, e.g. **vertical banded gastroplasty** (see **STOMACH STAPLING**) and **\*gastric banding**.

**gastroschisis** *n.* a congenital defect in the abdominal wall, which during fetal development fails to close to the right of a normal umbilical cord. Bowel herniates through the defect and has no covering; free loops of bowel can be seen floating in the amniotic cavity on ultrasound. Treatment is surgical. Compare **EXOMPHALOS**.

**gastroscope** *n.* an illuminated optical endoscope used to inspect the interior of the gullet (oesophagus), stomach, and duodenum. For many years these were rigid or semi-rigid instruments affording only limited views, but their modern counterparts are flexible instruments that house advanced digital systems to allow high-definition imaging of the oesophagus, stomach, and the proximal segments of the duodenum. Biopsies can be taken of visualized areas of mucosal abnormality, and therapeutic procedures (e.g. to stop a

bleeding ulcer, remove a polyp, insert a *\*gastrostomy*, dilate a stricture, or insert a self-expandable metal stent) may be performed. As the same instruments can usually be introduced into the duodenum they are also known as **gastroduodenoscopes** or **oesophagogastrroduodenoscopes**. — **gastroscopy** *n.*

**gastrostomy** *n.* a procedure in which an artificial opening is made through the anterior abdominal wall into the stomach to allow direct access for feeding or gastric decompression. A gastrostomy is performed when swallowing is considered unsafe or impossible, due either to neurological disease (such as stroke, multiple sclerosis, or motor neuron disease) or to obstruction by a tumour. It is often used temporarily after operations on the oesophagus or head and neck area until healing has occurred. Formerly a gastrostomy was always performed surgically, but it can now be done using an *\*endoscope* (**percutaneous endoscopic gastrostomy, PEG**) or by direct puncture under radiological guidance (**radiologically inserted gastrostomy, RIG**).

**gastrotomy** *n.* a procedure during abdominal surgery in which the stomach is opened, usually to allow inspection of the interior (e.g. to find a point of bleeding), to remove a foreign body, or to allow the oesophagus to be approached from below (e.g. to pull down a tube through a constricting growth).

**gastrula** *n.* an early stage in the development of many animal embryos. It consists of a double-layered ball of cells formed by invagination and movement of cells in the preceding single-layered stage (blastula) in the process of **gastrulation**. It contains a central cavity, the *\*archenteron*, which opens through the **blastopore** to the outside. True gastrulation only occurs in the embryos of amphibians and certain fish, but a similar process occurs in the embryonic disc in other vertebrates, including humans.

**gating** *n.* a method for acquiring images during specific parts of a fast-moving cycle. Cardiac gating and respiratory gating are used to avoid the movement artifact produced during the cardiac cycle and respiratory movement, respectively. Therefore the area imaged, for example during the R wave on an *\*electrocardiogram*, appears static. The imaging is usually correlated with a physiological measure, such as an ECG trace. Gating is used in CT, MRI, and nuclear medicine.

**Gaucher's disease** a genetically determined (autosomal *\*recessive*) disease resulting from the deposition of glucocerebrosides (*see CEREBROSIDE*) in the brain and other tissues (especially bone). It results in learning disability, abnormal limb posture and spasticity, and difficulty with swallowing. Carrier detection and *\*preimplantation genetic diagnosis* are possible; enzyme replacement therapy may be used in treatment. [P. C. E. Gaucher (1854–1918), French physician]

**gauss** *n.* a unit of magnetic flux density equal to 1 maxwell per square centimetre. 1 gauss =  $10^{-4}$  tesla.

**Gaussian distribution** *see* *FREQUENCY DISTRIBUTION*; *SIGNIFICANCE*. [K. F. Gauss (1777–1855), German mathematician]

**gauze** *n.* thin open-woven material used in several layers for the preparation of dressings and swabs.

**gavage** *n.* forced feeding: any means used to get an unwilling or incapacitated patient to take in food by mouth, especially via a stomach tube.

**GAVE (gastric antral vascular ectasia)** a condition characterized by the presence of dilated capillaries or veins in the lining of the distal stomach (the gastric *\*antrum*), which may extend to involve the whole of the stomach. It may be diffuse or it may adopt a more linear appearance like the stripes of a watermelon (**watermelon stomach**). Certain medical conditions (e.g. *\*cirrhosis*, *\*systemic sclerosis*, and chronic renal failure) are associated with this condition. It is often asymptomatic but can lead to transfusion-dependent anaemia. Treatment focuses on management of the underlying condition and endoscopic treatment of bleeding areas using *\*argon plasma coagulation* or laser thermocoagulation.

**G-cell** *n.* any of the gastrin-secreting cells of the stomach lining located predominantly in the gastric *\*antrum*. Gastrin stimulates the production of gastric acid by parietal cells in the stomach. Increased G-cell activity is associated with the formation of duodenal ulcers and the *\*Zollinger-Ellison syndrome*.

**GCS** *see* *GLASGOW COMA SCALE*.

**GDC** *see* *GENERAL DENTAL COUNCIL*.

**gefitinib** *n.* *see* EPIDERMAL GROWTH FACTOR RECEPTOR; TYROSINE KINASE INHIBITOR.

**gel** *n.* a colloidal suspension that has set to form a jelly. Some insoluble drugs are administered in the form of gels.

**gelatin** *n.* a jelly-like substance formed when tendons, ligaments, etc. containing **\*collagen** (a protein) are boiled in water. Gelatin has been used in medicine as a source of protein in the treatment of malnutrition, in pharmacy for the manufacture of capsules and suppositories, and in bacteriology for preparing culture media.

**gemcitabine** *n.* a **\*cytotoxic drug** that has an established role in the treatment of lung, pancreatic, bladder, and breast cancers. Side-effects are less severe than those of other **\*antimetabolites**.

**gemeprost** *n.* a **\*prostaglandin** drug, administered to terminate pregnancy. It causes powerful contractions of the uterus at any stage of pregnancy.

**gemfibrozil** *n.* a drug used to lower levels of **\*very low-density lipoproteins** in patients with **\*hypertriglyceridaemia** who have not responded to diet, weight reduction, or exercise (*see* FIBRATES). Side-effects include diarrhoea, abdominal pain, and nausea and vomiting.

**gemmule** *n.* one of the minute spines or surface extensions of a **\*dendrite**, through which contact is made with another neuron at a **\*synapse**.

**gender dysphoria** a condition in which an individual belongs to one gender on the basis of physical appearance and genetics but identifies psychologically with the other gender. The name was introduced in DSM-5; in DSM-IV-TR it was called **gender identity disorder**. The condition is diagnosed only where there is evidence of strong and persistent cross-gender identification and discomfort about one's sex, these cause significant distress and social impairment, and there is no concurrent endocrine disorder. Treatment may include counselling, hormone therapy, and gender reassignment surgery. *See also* TRANSGENDER.

**gene** *n.* the basic unit of genetic material, which is carried at a particular place on a **\*chromosome**. Originally it was regarded as the unit of inheritance and mutation but is now usually defined as a sequence of **\*DNA**

or **\*RNA** that acts as the unit controlling the formation of a single polypeptide chain (see **CISTRON**). In diploid organisms, including humans, genes occur as pairs of **\*alleles**. Various kinds of gene have been discovered: **structural genes** determine the biochemical makeup of the proteins; **regulator genes** control the rate of protein production (see **OPERON**). **Architectural genes** are responsible for the integration of the protein into the structure of the cell, and **temporal genes** control the time and place of action of the other genes and largely control the **\*differentiation** of the cells and tissues of the body.

**gene clone** see **CLONE**.

**General Dental Council (GDC)** (in Britain) a statutory body that regulates dental professionals and maintains standards for the benefit of patients.

**general dental services** a part of the NHS dental service. Dentists are included on the National Performer List and may be **\*independent contractors** or employed. Dental care is commissioned on the basis of units of dental activity (UDAs), a banding system that is scored according to the complexity of the treatment.

**general health questionnaire (GHQ)** a reliable screening tool published in 1978 for identifying minor psychiatric disorders, still frequently used for research in the general population. The 28-question version (**GHQ28**) is most commonly used, but the GHQ is available in lengths from 12 to 60 questions.

**general household survey** a rolling survey carried out annually (1971–2007) in Great Britain by the **\*Office for National Statistics**. It included questions about the household and questions to be completed by all individuals aged over 16 within the household. It covered a wide variety of topics, such as health, employment, pensions, education, and income. It was succeeded (2007–12) by the **general lifestyle survey**. See also **CENSUS**.

**generalized anxiety disorder** a condition characterized by inappropriate and sometimes severe anxiety, without adequate cause, that lasts for at least six months. It affects about 2% of the population, women twice as often as men, and often develops in early adult life. It can, however, start at any age. There is a hereditary tendency to develop the disorder and about 25% of

immediate relatives of sufferers are also affected. The disorder is thought to be caused by a disturbance of the functions of neurotransmitters, such as adrenaline or GABA, in the frontal lobes or the **\*limbic system** of the brain. Symptoms affect all parts of the body. Palpitations, sweating, tremor, and dry mouth are core symptoms; additional symptoms include giddiness, **\*bruxism**, restlessness, fatigability, breathlessness, lightheadedness, headaches, pins and needles, chest pain, fear of imminent death or losing control, diarrhoea, flushing, dysphagia, cramps, and muscle ache. Treatment includes **\*cognitive behavioural therapy** and medication (**\*SSRIs** or **\*SNRIs**).

**Generalized Anxiety Disorder Questionnaire** *see* **GAD-7**.

///

**General Medical Council (GMC)** the regulatory body of the medical profession in the UK, which was established in 1858 by the Medical Act and has statutory powers. It licenses doctors to practise medicine and has the power to revoke licences or place restrictions on practice. The governing body of the GMC, its Council, comprises 12 members, 6 of which are medically qualified and 6 of which are not. Its purpose is to protect, promote, and maintain the health and safety of the public by ensuring proper standards in the practice of medicine and medical education and training. Following various high-profile cases involving malpractice, there has been a shift in the role of the GMC from one of simple registration to that of **\*revalidation** of doctors.

<https://www.gmc-uk.org/>

- GMC website: includes the Council's guide to Good Medical Practice

**general paralysis of the insane (GPI, general paresis)** a stage of tertiary **\*syphilis** characterized by **\*dementia** and spastic weakness of the limbs (paresis). Deafness, epilepsy, and **\*dysarthria** may occur. The infecting organism can be detected in the brain cells and tests for syphilis in blood and cerebrospinal fluid are usually positive. When the symptoms are combined with those of **\*tabes dorsalis**, the resulting condition is called **tabo-paresis**. The condition is now rare due to widespread treatment of earlier stages with penicillin and other antibiotics.

**general practitioner (GP)** a doctor working in the community who provides family health services to a local area. General practitioners (also known as **family doctors** or **family practitioners**) may work on their own or in a **group practice** in which they share premises and other resources with one or more other doctors. GPs are usually the first port of call for most patients with concerns about their health. They look after patients with wide-ranging medical conditions and can refer patients with more complex problems to specialists, such as hospital consultants. Some GPs with additional training and experience in a specific clinical area take referrals for assessment and treatment that may otherwise have been referred directly to hospital consultants; these are known as **GPs with a special interest (GPwSI or GPSI)**. Most GPs work solely within the **\*National Health Service** but a few work completely privately. The current model of general practice allows for GPs to provide general medical services (GMS), the terms and conditions of which are governed by a national contract which is usually negotiated on an annual basis, or personal medical services (PMS), the terms and conditions of which are governed by locally negotiated contracts within a broad framework. The new primary care contract (nGMS contract) came into force in April 2004, allowing GPs to opt out of weekend and night (**\*out-of-hours**) service provision for patients registered with their practice. In this period, patient care is usually provided by an out-of-hours cooperative or deputizing service. At the same time the government also introduced the **\*Quality and Outcomes Framework (QOF)** as a means to improve the quality of care provided. Most GPs are **\*independent contractors** although more recently there has been an increase in the number of salaried GPs. GPs may employ a variety of staff, including **\*practice nurses**, **\*nurse practitioners**, and counsellors.

**general practitioner with special interest (GPwSI, GPSI)** *see* **GENERAL PRACTITIONER**.

**generic 1.** *adj.* denoting a nonproprietary drug name, which is not protected by a trademark (*see* **PROPRIETARY NAME**). **2.** *adj.* of or relating to a **\*genus**. **3.** *n.* a drug sold under its nonproprietary name.

**-genesis** *combining form denoting origin or development*. Example: **spermatogenesis** (development of spermatozoa).

**gene therapy** treatment directed to curing genetic disease by introducing normal genes into patients to overcome the effects of defective genes, using techniques of *\*genetic engineering*. The most radical approach would be to do this at a very early stage in the embryo, so that the new gene would be incorporated into the germ cells (ova and sperm) and would therefore be inheritable. However, this approach is not considered to be either safe or ethical, because the consequences would affect all descendants of the patient, and it is not being pursued. In **somatic cell gene therapy** the healthy gene is inserted into *\*somatic* cells (such as the *\*haemopoietic stem cells* of the bone marrow) that give rise to other cells. All the surviving descendants of these modified cells will then be normal and, if present in sufficient numbers, the condition will be cured (the defective gene will, however, still be present in the germ cells).

At present, gene therapy is most feasible for treating disorders caused by a defect in a single recessive gene, so that the deficiency can be overcome by the introduction of a normal allele (therapy for disorders caused by dominant genes (e.g. Huntington's disease) would require the modification or replacement of the defective allele as its effect is expressed in the presence of a normal allele). Examples of such recessive disorders include *\*adenosine* deaminase (ADA) deficiency and *\*cystic fibrosis*. Gene therapy trials for the former condition have already begun: lymphocyte stem cells are isolated from the patient, using *\*monoclonal antibodies*, and incubated with *\*retroviruses* that have been genetically engineered to contain the normal ADA gene (*see VECTOR*). This gene thus becomes integrated into the stem cells, which – when returned to the patient's bone marrow – can then produce normal lymphocytes. A similar technique has been used in treating patients with *\*severe combined immune deficiency* and is feasible for other blood disorders, such as sickle-cell anaemia and thalassaemia.

Clinical trials for the gene therapy of cystic fibrosis involve using *\*liposomes* to introduce the normal gene into the lungs of sufferers via an inhaler.

Gene therapy for certain types of cancer is also undergoing clinical trials. Here the approach is aimed at introducing into the cancer cells tumour-suppressing genes, such as *\*p53* (which prevents uncontrolled cell division), or genes that direct the production of substances (such as *\*interleukin 2*) that stimulate the immune system to destroy the tumour cells.

**genethics** *n.* the study of the social, moral, and political implications of knowledge and practice in genetics and genomics.

**genetic code** the code in which genetic information is carried by **\*DNA** and **\*messenger RNA**. This information determines the sequence of amino acids in every protein and thereby controls the nature of all proteins made by the cell. The genetic code is expressed by the sequence of **\*nucleotide** bases in the nucleic acid molecule, a unit of three consecutive bases (a **codon**) coding for each amino acid. The code is translated into protein at the ribosomes (*see* **TRANSCRIPTION**; **TRANSLATION**). Any changes in the genetic code result in the insertion of incorrect amino acids in a protein chain, giving a **\*mutation**.

**genetic counselling** the procedure by which patients and their families are given advice about the nature and consequences of inherited disorders, the possibility of becoming affected or having affected children, and the various options that are available to them for the prevention, diagnosis, and management of such conditions. Genetic counselling should be available at prenatal and postnatal clinics, and also through family planning clinics.

**genetic drift** the tendency for variations to occur in the genetic composition of small isolated inbreeding populations by chance. Such populations become genetically rather different from the original population from which they were derived.

**genetic engineering (recombinant DNA technology)** the techniques involved in altering the characteristics of an organism by inserting genes from another organism into its DNA. This altered DNA (known as **recombinant DNA**) is usually produced by isolating foreign genes, often by the use of **\*restriction enzymes**, and inserting them into bacterial DNA, often using viruses as **\*vectors**. Once inserted, the foreign gene may use the cell machinery of its host to synthesize the protein that it originally coded for in the organism it was derived from. For example, the human genes for **\*insulin**, **\*interferon**, and **\*growth hormone** production have been incorporated into bacterial DNA and such genetically engineered bacteria are used in the commercial production of these substances. Some other applications of genetic engineering include DNA analysis, the production of **\*monoclonal antibodies**, and – more recently – **\*gene therapy**.

**genetics** *n.* the science of inheritance. It attempts to explain the differences and similarities between related organisms and the ways in which characters are passed from parents to their offspring. **Human** and **medical genetics** are concerned with the study of inherited diseases. *See also* **CYTOGENETICS**; **MENDEL'S LAWS**.

**genetic screening** *\*screening tests* to discover individuals whose *\*genotypes* are associated with specific diseases. Such individuals may later develop the disease itself or pass it on to their children (*see* **CARRIER**). The recent use of genetic screening to diagnose the sex of the fetus so that the parents may 'choose' the sex of their children has caused considerable controversy. *See also* **MOUTHWASH TEST**; **PREIMPLANTATION GENETIC DIAGNOSIS**.

**geni- (genio-)** *combining form denoting the chin.*

**-genic** *combining form denoting* **1.** producing. **2.** produced by.

**genicular** *adj.* relating to the knee joint: applied to arteries that supply the knee.

**geniculum** *n.* a sharp bend in an anatomical structure, such as the bend in the facial nerve in the medial wall of the middle ear.

**genion** *n.* (in *\*craniometry*) the tip of the protuberance of the chin.

**genioplasty** *n.* an operation performed in plastic surgery to alter the size and shape of the chin. This can be built up with grafted bone, cartilage, or artificial material.

**genital** *adj.* relating to the reproductive organs or to reproduction.

**genital herpes** *see* **HERPES**.

**genitalia** *pl. n.* the reproductive organs of either the male or the female. However, the term is usually used in reference to the external parts of the reproductive system. *See also* **VULVA**.

**genito-** *combining form denoting the reproductive organs.* Examples: **genitoplasty** (plastic surgery of); **genitourinary** (relating to the reproductive and excretory systems).

**genitourinary medicine** the medical specialty concerned with the study and treatment of **\*sexually transmitted diseases**.

**genodermatosis** *n.* any genetically determined skin disorder, such as **\*ichthyosis**, **\*neurofibromatosis**, or **\*xeroderma pigmentosum**.

**genogram** *n.* in family **\*psychotherapy**, a family tree and a family history of a particular psychological disorder, which are constructed in view of the whole family to help them understand each other better.

**genome** *n.* the total genetic material of an organism, comprising the genes contained in its chromosomes; sometimes the term is used for the basic **\*haploid** set of chromosomes of an organism. The human genome comprises 23 pairs of chromosomes (*see* **HUMAN GENOME PROJECT**).

**genomics** *n.* the branch of genetics concerned with the study of genomes. It includes both the mapping of genomes – and ultimately producing a DNA sequence for any particular organism or individual – and understanding how gene expression is controlled and gene products change under different conditions, including disease states.

**genotype** *n.* **1.** the genetic constitution of an individual or group, as determined by the particular set of genes it possesses. **2.** the genetic information carried by a pair of alleles, which determines a particular characteristic. **3.** a gene or pattern of genes the precise details of which are defined. *Compare* **PHENOTYPE**.

**gentamicin** *n.* an **\*aminoglycoside** antibiotic used to treat serious infections caused by a wide range of bacteria. Kidney and ear damage may occur at high doses.

**gentian violet** **1.** a dye used for staining tissues and microorganisms for microscopical study. **2.** *see* **METHYL VIOLET**.

**genu** *n.* **1.** the knee. **2.** any bent anatomical structure resembling the knee. — **genual** *adj.*

**genuine stress incontinence** *see* **INCONTINENCE**.

**genus** *n.* (*pl.* **genera**) a category used in the classification of animals and plants. A genus consists of several closely related and similar species; for

example the genus *Canis* includes the dog, wolf, and jackal.

**genu valgum** abnormal in-curving of the legs at the knees, resulting in excessive separation of the feet when the knees are in contact. *See* **KNOCK-KNEE**.

**genu varum** abnormal outward curving of the legs at the knees, resulting in separation of the knees. *See* **BOW-LEGS**.

**geo-** *combining form denoting the earth or soil.*

**geographical tongue** a benign loss of papillae on the surface of the tongue taking the form of areas of **\*erythema** that change from day to day. Medical names: **benign migratory glossitis, erythema migrans**.

**ger- (gero-, geront(o-))** *combining form denoting old age.*

**geriatrics** *n.* the branch of medicine concerned with the diagnosis and treatment of disorders that occur in old age and with the care of the aged. *See also* **GERONTOLOGY**.

**germ** *n.* any microorganism, especially one that causes disease. *See also* **INFECTION**.

**German measles** a mild highly contagious virus infection, mainly of childhood, causing enlargement of lymph nodes in the neck and a widespread pink rash. The disease is spread by close contact with a patient. After an incubation period of 2–3 weeks a headache, sore throat, and slight fever develop, followed by swelling and soreness of the neck and the eruption of a rash of minute pink spots, spreading from the face and neck to the rest of the body. The spots disappear within 7 days but the patient remains infectious for a further 3–4 days. An infection usually confers immunity. As German measles can cause fetal malformations during early pregnancy, girls should be immunized against the disease before puberty. Most children now receive immunization via the **\*MMR vaccine** as part of the routine childhood vaccination schedule. Medical name: **rubella**. *Compare* **SCARLET FEVER**.

**germ cell (gonocyte)** any of the embryonic cells that have the potential to develop into spermatozoa or ova. The term is also applied to any of the cells undergoing gametogenesis and to the gametes themselves.

**germ cell tumour** a tumour arising in *\*germ cells*, commonly in the testis and ovary but also found at other sites. Examples are *\*teratomas*, *\*seminomas*, *\*dysgerminomas*, and *\*choriocarcinomas*. They may be benign or malignant and typically occur in children and young adults. Tumour markers, including *\*alpha-fetoprotein* and beta *\*human chorionic gonadotrophin*, can be used to monitor disease.

**germicide** *n.* an agent that destroys microorganisms, particularly those causing disease. *See also* [ANTIBIOTIC](#); [ANTIFUNGAL](#); [ANTISEPTIC](#); [DISINFECTANT](#).

**germinal** *adj.* **1.** relating to the early developmental stages of an embryo or tissue. **2.** relating to a germ.

**germinal epithelium** the epithelial covering of the ovary, which was formerly thought to be the site of formation of *\*oogonia*. It is now thought that the oogonia persist in a dormant state from the prenatal period until required in reproductive life.

**germinal vesicle** the nucleus of a mature *\*oocyte*, prior to fertilization. It is considerably larger than the nucleus of other cells.

**germ layer** any of the three distinct types of tissue found in the very early stages of embryonic development (*see* [ECTODERM](#); [ENDODERM](#); [MESODERM](#)). The germ layers can be traced throughout embryonic development as they differentiate to form the entire range of body tissues.

**germ plasm** the substance postulated by 19th-century biologists (notably Weismann) to be transmitted via the gametes from one generation to the next and to give rise to the body cells.

**gerontology** *n.* the study of the changes in the mind and body that accompany ageing and the problems associated with them.

**Gerstmann's syndrome** a group of symptoms that represent a partial disintegration of the patient's recognition of his or her *\*body image*. It consists of an inability to name the individual fingers, misidentification of the right and left sides of the body, and inability to write or make mathematical calculations (*see* [ACALCULIA](#); [AGRAPHIA](#)). It is caused by disease in the

association area of the dominant (usually left) parietal lobe of the brain. [J. G. Gerstmann (1887–1969), Austrian neurologist]

**Gerstmann–Straussler–Scheinker syndrome** an autosomal *\*dominant* condition that is caused by a mutation in the *\*prion* protein gene and resembles *\*Creutzfeldt-Jakob disease* (CJD). Patients present with cerebellar dysfunction (*\*ataxia* and *\*dysarthria*) and later develop dementia. They continue to deteriorate over several years, in contrast with patients with CJD, who deteriorate rapidly over periods of less than 12 months. [J. G. Gerstmann]

**gestaltism (gestalt psychology)** *n.* a school of psychology, originating in Germany, that regards mental processes as wholes (**gestalt**, from the German meaning ‘form’ or ‘body’) that cannot be broken down into constituent parts. From this was developed **gestalt therapy**, which aims at achieving a suitable gestalt within the patient that includes all facets of functioning.

**gestation** *n.* the period during which a fertilized egg cell develops into a baby that is ready to be delivered. Gestation averages 266 days in humans (or 280 days from the first day of the last menstrual period). *See also* **PREGNANCY**.

**gestational diabetes mellitus** diabetes or impaired glucose tolerance that is diagnosed during pregnancy (*see* **GLUCOSE TOLERANCE TEST**). Women at increased risk of gestational diabetes include those with a personal history of the condition, obesity, or a family history of diabetes, and those who have had a previously unexplained stillbirth. In most cases gestational diabetes resolves at the end of the pregnancy, but such women are at increased risk of developing type 2 diabetes thereafter. It is treated by dietary control with or without insulin or metformin to avoid the fetal complications of *\*macrosomia* and hypoglycaemia. *See also* **PREGESTATIONAL DIABETES**.

**gestational trophoblastic disease (GTD)** a group of disorders spanning the conditions of complete and partial molar pregnancies (*see* **HYDATIDIFORM MOLE**) through to the malignant conditions of invasive mole, *\*choriocarcinoma*, and the very rare placental site trophoblastic tumour (PSTT). If there is any evidence of persistence of GTD, most commonly

defined as a persistent elevation of *\*human chorionic gonadotrophin*, the condition is described as *\*gestational trophoblastic neoplasia*.

**gestational trophoblastic neoplasia (GTN)** a group of disorders characterized by persistence of *\*gestational trophoblastic disease*, with abnormal placental development and very high levels of *\*human chorionic gonadotrophin* (hCG). The chorionic villi are fluid-filled with vacuolation of the placenta and destruction of the normal stroma. GTN is rare in the UK, with a calculated incidence of 1/714 live births. It may develop after a molar pregnancy (*see* **HYDATIDIFORM MOLE**), a nonmolar pregnancy, or a live birth. The incidence after a live birth is estimated at 1/50,000. A malignant condition may develop (*see* **CHORIOCARCINOMA**) if the abnormal tissue is not completely removed and the risk of this is monitored by the fall in hCG levels. Choriocarcinoma complicates approximately 3% of complete moles, although in 50% of cases of choriocarcinoma there is no history of immediately preceding trophoblastic disease. It may also occur following a normal pregnancy. In the UK, there is an effective registration and treatment programme. The programme has achieved impressive results, with high cure (98–100%) and low chemotherapy (5–8%) rates.

**gestodene** *n.* a *\*progestogen* used in oral contraceptives in combination with *\*ethinylestradiol* (an oestrogen).

**GFR** *see* **GLOMERULAR FILTRATION RATE**.

**Ghon's focus** the lesion produced in the lung of a previously uninfected person by tubercle bacilli. It is a small focus of granulomatous inflammation, which may become visible on a chest X-ray if it grows large enough or if it calcifies. A Ghon focus usually heals without further trouble, but in some patients tuberculosis spreads from it via the lymphatics, the air spaces, or the bloodstream. [A. Ghon (1866–1936), Czech pathologist]

**ghost vessels** empty transparent blood vessels that persist in the cornea after regression of the inflammatory process that stimulated their development.

**GHQ** *see* **GENERAL HEALTH QUESTIONNAIRE**.

**ghrelin** *n.* a hormone produced by stomach cells that increases appetite and stimulates secretion of growth hormone (levels increase before meals and decrease thereafter). Its receptors and site of action are in the hypothalamus.

Ghrelin levels are lower in obese individuals (suggesting that the hormone does not stimulate eating) and higher in patients with anorexia nervosa.

**GI** *see* **GLYCAEMIC INDEX**.

**giant cell** any large cell, such as a **\*megakaryocyte**. Giant cells may have one or many nuclei.

**giant-cell arteritis** *see* **ARTERITIS**.

**Giardia** *n.* a genus of parasitic pear-shaped protozoa inhabiting the human small intestine. They have four pairs of **\*flagella**, two nuclei, and two sucking discs used for attachment to the intestinal wall. *Giardia* is usually harmless but may occasionally cause diarrhoea (*see* **GIARDIASIS**).

**giardiasis (lambliasis)** *n.* a disease caused by the parasitic protozoan *Giardia lamblia* in the small intestine. Individuals become infected by eating food contaminated with cysts containing the parasite. Symptoms include diarrhoea, nausea, bellyache, and flatulence, as well as the passage of pale fatty stools (steatorrhoea). Large numbers of the parasite may interfere with the absorption of food through the gut wall. The disease occurs throughout the world and is particularly common in children; it responds well to oral doses of **\*metronidazole**.

**gibbus (gibbosity)** *n.* a sharply angled curvature of the backbone, resulting from collapse of a vertebra. Infection with tuberculosis was a common cause.

**Giemsa's stain** a mixture of **\*methylene blue** and **\*eosin**, used for distinguishing different types of white blood cell and for detecting parasitic microorganisms in blood smears. It is one of the **\*Romanowsky stains**. [G. Giemsa (1867–1948), German chemist]

**gift** *n.* something that is given voluntarily to someone, either in exchange or from an unselfish (altruistic) desire to help another. Patients may wish to thank their clinicians by giving a gift. However, some may see this as 'buying' future attention, and some health-service employers and authorities have introduced guidelines for staff: clinicians should be clear what they may and may not accept. Altruistic giving remains the way in which transplants or

blood products are obtained in the NHS, and buying or selling organs is seen as a potential **\*harm** and so unethical and possibly illegal.

**GIFT** *see* **GAMETE INTRAFALLOPIAN TRANSFER**.

**gigantism** *n.* abnormal growth causing excessive height, most commonly due to oversecretion during childhood of **\*growth hormone** (somatotrophin) by the pituitary gland. In **eunuchoid gigantism** the tall stature is due to delayed puberty, which results in continued growth of the long bones before their growing ends (epiphyses) fuse. *See also* **SOTOS SYNDROME**.

**GIK regime** *see* **ALBERTI REGIME**.

**Gilbert's syndrome** familial unconjugated hyperbilirubinaemia: a condition due to a congenital deficiency of the enzyme UDP glucuronyl transferase in liver cells that is inherited as an autosomal **\*dominant** or autosomal **\*recessive** characteristic. Patients become mildly jaundiced, especially if they fast, overexert themselves, or have concomitant infection. Most patients are diagnosed following investigation of mildly abnormal liver function tests. The condition is lifelong but of little clinical consequence. [N. A. Gilbert (1858–1927), French physician]

**Gilles de la Tourette syndrome** *see* **TOURETTE'S SYNDROME**.

**Gillick competence** the means by which to assess legal **\*capacity** in children under the age of 16 years, established in the case *Gillick v West Norfolk and Wisbech Area Health Authority* (1985) 2 All ER 402. Such children are deemed to be capable of giving valid **\*consent** to advice or treatment without parental knowledge or agreement provided they have sufficient understanding to appreciate the nature, purpose, and hazards of the proposed treatment. In the Gillick case the criteria for deciding competence, set out by Lord Fraser, related specifically to contraceptive treatment. In addition to the elements of Gillick competence, the **Fraser guidelines** specified that a health professional must be convinced that the child was likely to begin, or to continue having, sexual intercourse with or without contraceptive treatment, that his or her physical and/or mental health would probably suffer in the absence of treatment, and it was in his or her best interests to provide treatment. The principle of Gillick competence applies to all treatment for

those under the age of 16, not just contraceptive services. —**Gillick-competent** *adj.*

**Gimbernat's ligament** a portion of the medial end of the **\*inguinal ligament** that is reflected along the upper part of the pubic bone. It is used to hold stitches during repairs of a femoral **\*hernia**. [A. de Gimbernat (1734–1816), Spanish surgeon and anatomist]

**gingiv-** (**gingivo-**) *combining form denoting the gums*. Example: **gingivoplasty** (plastic surgery of).

**gingiva** *n.* (*pl.* **gingivae**) the gum: the layer of dense connective tissue and overlying mucous membrane that covers the alveolar bone and necks of the teeth. —**gingival** *adj.*

**gingival biotype** the thickness or thinness of the **\*gingiva** in the faciopalatal dimension. A thin gingival biotype is thought to have a direct relation with gingival recession following surgical and restorative procedures.

**gingivectomy** *n.* the surgical removal of gum tissue. This is a specific procedure of periodontal surgery, performed to reduce the depth of a **\*periodontal pocket** or to bring the margin of a crown to above gum level.

**gingivitis** *n.* a reversible inflammation of the gums (*see* **GINGIVA**) caused by **\*plaque** on the surfaces of the teeth at their necks. The gums are swollen and bleed easily. **Chronic gingivitis** can be an early precursor to **\*periodontal disease** but is reversible with good oral hygiene. **\*Ulcerative gingivitis** is painful and destructive. Gingival overgrowth may be caused by drug therapy, e.g. phenytoin, or hormones during pregnancy.

**ginglymus (hinge joint)** *n.* a form of **\*diarthrosis** (freely movable joint) that allows angular movement in one plane only, increasing or decreasing the angle between the bones. Examples are the knee joint and the elbow joint.

**girdle** *n.* (in anatomy) an encircling or arching arrangement of bones. *see also* **PELVIC GIRDLE**; **SHOULDER GIRDLE**.

**GIST** *see* **GASTROINTESTINAL STROMAL TUMOUR**.

**glabella** *n.* the smooth rounded surface of the **\*frontal bone** in the middle of the forehead, between the two eyebrows.

**gladiolus** *n.* the middle and largest segment of the **\*sternum**.

**gland** *n.* an organ or group of cells that is specialized for synthesizing and secreting certain fluids, either for use in the body or for excretion. There are two main groups of glands: the **\*exocrine glands**, which discharge their secretions by means of ducts, and the **\*endocrine glands**, which secrete their products – hormones – directly into the bloodstream. *See also* **SECRETION**.

**glanders (equinia)** *n.* an infectious disease of horses, donkeys, and mules that is caused by the bacterium *Pseudomonas mallei* and can be transmitted to humans. Symptoms include fever and inflammation (with possible ulceration) of the lymph nodes (a form of the disease known as **farcy**), skin, and nasal mucous membranes. In the untreated acute form death may follow in 2–20 days. In the more common chronic form, many patients survive without treatment. Administration of antibiotics is usually effective.

**glandular fever** an infectious disease, caused by the Epstein-Barr virus, that affects the lymph nodes in the neck, armpits, and groin. In the western world it mainly affects adolescents and young adults; in developing countries young children are most affected. After an incubation period of 5–7 days, symptoms commence with swelling and tenderness of the lymph nodes, fever, headache, a sore throat, lethargy, and loss of appetite. In some cases the liver is affected, causing **\*hepatitis**, or the spleen is enlarged. Glandular fever is diagnosed by the presence of large numbers of **\*monocytes** in the blood. Complications are rare but symptoms may persist for weeks before recovery. Medical name: **infectious mononucleosis**.

**glans (glans penis)** *n.* the acorn-shaped end part of the **\*penis**, formed by the expanded end of the corpus spongiosum (erectile tissue). It is covered by the prepuce (foreskin), unless this has been removed by circumcision. The term glans is also applied to the end of the **\*clitoris**.

**glansectomy** *n.* a surgical procedure that involves excising the **\*glans**, which preserves the penis and is an option for men with penile cancer.

**glare** *n.* the undesirable effects of scattered stray light on the retina, causing reduced contrast and visual performance as well as annoyance and discomfort. Glare is most commonly caused by cataract or corneal opacity

**Glasgow Coma Scale (GCS, Glasgow scoring system)** a numerical system used to estimate a patient's level of consciousness after head injury. Each of the following are numerically graded: eye opening (1–4), motor response (1–6), and verbal response (1–5). The higher the score, the greater the level of consciousness: a score of 7 indicates a coma.

**glass ionomer** a dental filling material that is based on a \*cement of a silicate glass and an organic acid.

**glatiramer** *n.* a drug that modifies the body's immune response and is used to reduce the frequency of relapses in people with relapsing/remitting multiple sclerosis. Side-effects include flushing and palpitations.

**glaucoma** *n.* a condition of the \*optic nerve in which a loss of retinal nerve fibres leads to loss of vision. The most significant and manageable risk factor is the pressure in the eye. There are two types of **primary glaucoma** (in which no other ocular disease is present): acute and chronic simple. In **acute (or angle-closure) glaucoma**, there is an abrupt rise in pressure due to sudden closure of the angle of the anterior chamber between the cornea and iris where aqueous humour usually drains from the eye. This is accompanied by sudden and severe pain with marked blurring of vision associated with inflammation of the anterior segment. In the more common **chronic simple (or open-angle) glaucoma**, the pressure increases gradually, usually without any symptoms, and the visual loss is insidious. The same type of visual loss may also occur in eyes with a normal pressure: this is called **normal (or low-tension) glaucoma**. Primary glaucoma occurs increasingly with age and is an important cause of blindness. It is frequently hereditary. **Secondary glaucoma** may occur when other ocular disease impairs the normal circulation of the aqueous humour and causes the intraocular pressure to rise.

In all types of glaucoma the aim of the treatment is to reduce the intraocular pressure. Drugs used for this purpose include beta blockers (e.g. timolol, levobunolol, carteolol), carbonic anhydrase inhibitors (e.g. brinzolamide, dorzolamide), alpha-receptor stimulants (e.g. apraclonidine, brimonidine), and prostaglandin analogues (e.g. latanoprost, bimatoprost, travaprost, tafluprost). They can be used in the form of eye drops. If the medical treatment is ineffective, surgery may be performed to allow the aqueous humour to drain from the eye in sufficient quantities to enable the pressure to return to normal. Such operations may either make a new channel

through which the aqueous drains (known as **drainage** or **filtering operations**) or involve the insertion of a narrow tube (**tube surgery**).

**glaukomflecken** *pl. n.* small anterior subcapsular lens opacities seen in acute (angle-closure) glaucoma.

**Gleason grade** the grade (from one to five) given to an area of prostate cancer, reflecting the level of differentiation of the tumour. The tumour pattern is assessed by examining the gland at low magnification. Higher grades indicate poorer differentiation. [D. F. Gleason (1920–2008), US pathologist]

**Gleason score** a numerical score from two to ten, which is the sum of the two **\*Gleason grades** given to the most common and second most common pattern of prostate cancer seen in the tumour.

**gleet** *n.* a discharge of purulent mucus from the penis or vagina resulting from chronic **\*gonorrhoea**.

**glenohumeral** *adj.* relating to the glenoid cavity and the humerus: the region of the shoulder joint.

**glenoid cavity (glenoid fossa)** the socket of the shoulder joint: the pear-shaped cavity at the top of the **\*scapula** into which the head of the humerus fits.

**gli- (glio-)** *combining form denoting* **1.** glia. **2.** a glutinous substance.

**glia (neuroglia)** *n.* the special connective tissue of the central nervous system, composed of different cells, including the **\*oligodendrocytes**, **\*astrocytes**, ependymal cells (*see* **EPENDYMA**), and **\*microglia**, with various supportive and nutritive functions. Glial cells outnumber the neurons by between five and ten to one, and make up some 40% of the total volume of the brain and spinal cord. —**glial** *adj.*

### Types of glia.

**gliadin** *n.* a protein, soluble in alcohol, that is obtained from wheat. It is one of the constituents of **\*gluten**.

**glibenclamide** *n.* a long-acting **\*oral hypoglycaemic drug** that reduces the level of sugar in the blood and is used to treat type 2 diabetes (*see* **SULPHONYLUREA**). It is not recommended for the elderly. Side-effects include mild digestive upsets and skin reactions.

**gliclazide** *n.* the most commonly prescribed **\*sulphonylurea** oral hypoglycaemic drug used in the treatment of type 2 diabetes.

**gliding joint** *see* **ARTHRODIC JOINT**.

**glioblastoma (glioblastoma multiforme)** *n.* the most aggressive type of brain tumour derived from non-nervous (glial) tissue (*see* **ASTROCYTOMA**). Its rapid enlargement destroys normal brain cells, with a progressive loss of function, and raises intracranial pressure, causing headache, vomiting, and drowsiness. Treatment is never curative and the prognosis is poor.

**glioma** *n.* any tumour of non-nervous cells (**\*glia**) in the nervous system. The term is sometimes also used for all tumours that arise in the central nervous system, including **\*astrocytomas** and **\*glioblastomas**. Tumours of low-grade malignancy produce symptoms by pressure on surrounding structures; those of high-grade malignancy may be infiltrative.

**gliosome** *n.* a **\*lysosome** in an **\*astrocyte**.

**glipizide** *n.* a short-acting drug used to control high blood-glucose levels (hyperglycaemia) in patients with type 2 diabetes after diet control has failed (*see* **SULPHONYLUREA**). Side-effects are hypoglycaemia, nausea and vomiting, and skin rash.

**Glivec** *n.* *see* **IMATINIB**.

**global ethics** an approach to moral problems acknowledging that ethical analysis is frequently culture-specific and geographically limited. The international and worldwide experience of health care is the subject of study and there is commonly close attention to inequities in health and health-care provision, with frequent emphasis on **\*human rights**, **\*justice**, and **\*equality**.

**globin** *n.* a protein, found in the body, that can combine with iron-containing groups to form **\*haemoglobin** (which is found in red blood cells) and **\*myoglobin** (found in muscle).

**globulin** *n.* one of a group of simple proteins that are soluble in dilute salt solutions and can be coagulated by heat. A range of different globulins is present in the blood (the **serum globulins**, including alpha ( $\alpha$ ), beta ( $\beta$ ), and **\*gamma ( $\gamma$ ) globulins**). Some globulins have important functions as antibodies (*see* **IMMUNOGLOBULIN**); others are responsible for the transport of lipids, iron, or copper in the blood. *See also* **HORMONE-BINDING GLOBULINS**.

**globulinuria** *n.* the presence in the urine of globulins.

**globus** *n.* a spherical or globe-shaped structure; for example the **globus pallidus**, part of the lenticular nucleus in the brain (*see* **BASAL GANGLIA**).

**globus hystericus** *see* **GLOBUS PHARYNGEUS**.

**globus pharyngeus** a common condition characterized by a sensation of a lump in the throat, in the midline just above the sternum; swallowing is not affected. The condition, formerly called **globus hystericus**, is sometimes related to **\*gastro-oesophageal reflux** and tends to be worse during periods of stress.

**glomangioma** *n.* *See* **GLOMUS TUMOUR**. *See also* **GLOMUS**.

**glomerular filtration rate (GFR)** the rate at which substances are filtered from the blood of the glomeruli into the Bowman's capsules of the **\*nephrons**. It is calculated by measuring the **\*clearance** of specific substances (e.g. creatinine) and is an index of renal function. *See* **EGFR**.

**glomerulonephritis (glomerular nephritis, GN)** *n.* inflammation of the glomeruli, although in practice the term is used for a number of glomerular conditions lacking microscopical signs of inflammation. For instance, **\*membranous nephropathy** is often referred to as membranous glomerulonephritis. GN may be a primary disease, restricted in its clinical manifestations to the kidney, or part of a multisystem disorder, such as systemic **\*lupus erythematosus** or **\*vasculitis**. Its presentation may be acute, with a **\*nephritic** or **\*nephrotic syndrome**; subacute, with rapidly declining renal function over a period of days or weeks; or chronic, with signs of the disease picked up on routine medical examination. Abnormalities of urine analysis are to be expected, with blood, protein, and casts present in variable amounts. Arterial hypertension is a common associated finding. GN is classified according to the different patterns of histological injury seen on renal biopsy specimens; these are examined by light and electron microscopy and by immunofluorescent studies.

**glomerulus** *n.* (*pl.* **glomeruli**) **1.** the network of blood capillaries contained within the cuplike end (**Bowman's capsule**) of a **\*nephron**. It is the site of

primary filtration of waste products from the blood into the kidney tubule. **2.** any other small rounded mass.

**glomus** *n.* (*pl.* **glomera**) a small communication between a tiny artery and vein in the skin of the limbs. It is concerned with the regulation of temperature.

**glomus jugulare** a collection of **\*paraganglion** cells in close relation to the internal jugular vein at its origin at the base of the skull. It is a site of origin for **\*glomus tumours** (*see also* **PARAGANGLIOMA**).

**glomus tumour** **1.** a benign tumour arising from **\*paraganglion** cells associated with the vagus or glossopharyngeal nerves in the neck (*see* **PARAGANGLIOMA**). In the middle ear they are called **glomus tympanicum tumours**; around the jugular vein they are called **glomus jugulare tumours**. **2.** (**glomangioma**) a harmless but often painful tumour produced by malformation and overgrowth of a **\*glomus**, usually in the skin at the ends of the fingers or toes. It may be cauterized or removed surgically.

**gloss-** (**glosso-**) *combining form denoting* the tongue. Examples: **glossopharyngeal** (relating to the tongue and pharynx); **glossoplasty** (plastic surgery of).

**glossa** *n.* *see* **TONGUE**.

**glossectomy** *n.* surgical removal of the tongue, an operation usually carried out to remove a tumour.

**Glossina** *n.* *see* **TSETSE**.

**glossitis** *n.* inflammation of the tongue. Causes include anaemia, candidiasis, and vitamin deficiency. *See also* **GEOGRAPHICAL TONGUE**.

**glossolalia** *n.* nonsense speech that mimics normal speech in that it is appropriately formed into an imitation of syllables, words, and sentences. It can be uttered in **\*trance** states and during sleep.

**glossopharyngeal nerve** the ninth **\*cranial nerve** (IX), which supplies motor fibres to part of the pharynx and to the parotid salivary glands and sensory fibres to the posterior third of the tongue and the soft palate.

**glossoplegia** *n.* paralysis of the tongue.

**glottis** *n.* the space between the two **\*vocal folds**. The term is often applied to the vocal folds themselves or to that part of the larynx associated with the production of sound.

**GLP-1 receptor agonists** a group of drugs used in the treatment of type 2 diabetes. They mimic the actions of **\*glucagon-like peptide-1** in regulating the rise in blood glucose levels after eating and they also enhance satiety (*see* **INCRETIN**). As these drugs respond to a falling blood glucose level there is a reduced tendency to **\*hypoglycaemia** compared with **\*sulphonylurea** drugs and insulin therapy itself. They are given by subcutaneous injection and three of them are licensed for use in the UK: **exenatide** (Byetta; twice daily dosing), **liraglutide** (Victoza; once daily dosing), and **lixisenatide** (Lyxumia; once daily dosing).

**gluc-** (**gluco-**) *combining form denoting* glucose. Example: **glucosuria** (urinary excretion of).

**glucagon** *n.* a hormone, produced by the pancreas, that causes an increase in the blood sugar level and thus has an effect opposite to that of **\*insulin**. Glucagon is administered by injection to counteract diabetic **\*hypoglycaemia**.

**glucagon-like peptide-1 (GLP-1)** a hormone – an **\*incretin** – that is produced in the small intestine. GLP-1 has a half-life in the blood circulation of less than two minutes due to rapid breakdown by the enzyme dipeptidyl peptidase-IV (DPP-IV). It is a potent antihyperglycaemic hormone, stimulating the release of insulin from the pancreatic beta cells in response to a rising blood glucose level after eating. This glucose-sensitive action also allows the effect of GLP-1 on the beta cells to switch off when the blood glucose level comes down to the normal baseline between meals. Thus the **\*GLP-1 receptor agonist** group of drugs, used in type 2 diabetes, can restrict the rise in blood glucose level after meals but have a low risk of causing subsequent **\*hypoglycaemia**.

**glucagonoma** *n.* a usually malignant pancreatic tumour of the alpha cells of the **\*islets of Langerhans** that secretes excessive amounts of glucagon and

causes impaired glucose tolerance or diabetes, a specific dermatitis, and weight loss.

**glucagon stimulation test** a test for *\*phaeochromocytomas* not displaying typically high levels of plasma *\*catecholamines*. An intravenous bolus of *\*glucagon* is administered and the test is positive when there is a threefold increase in plasma catecholamine levels with a consequent rise in blood pressure. The test is now very rarely used due to safer and more sensitive screening tests, combined with modern tumour imaging techniques.

**glucocorticoid** *n. see* CORTICOSTEROID.

**glucokinase** *n.* an enzyme (a *\*hexokinase*), found in the liver, that catalyses the conversion of glucose to glucose-6-phosphate. This is the first stage of *\*glycolysis*.

**gluconeogenesis** *n.* the biochemical process in which glucose, an important source of energy, is synthesized from non-carbohydrate sources, such as amino acids. Gluconeogenesis occurs mainly in the liver and kidney and meets the needs of the body for glucose when carbohydrate is not available in sufficient amounts in the diet.

**glucosamine** *n.* the amino sugar of glucose, i.e. glucose in which the hydroxyl group is replaced by an amino group. Glucosamine is a component of *\*mucopolysaccharides* and *\*glycoproteins*: for example, *\*hyaluronic acid*, a mucopolysaccharide found in synovial fluid, and *\*heparin*. Glucosamine is taken as a supplement to help manage osteoarthritis.

**glucose (dextrose)** *n.* a simple sugar containing six carbon atoms (a hexose). Glucose is an important source of energy in the body and the sole source of energy for the brain. Free glucose is not found in many foods (grapes are an exception); however, glucose is one of the constituents of both sucrose and starch, both of which yield glucose after digestion. Glucose is stored in the body in the form of *\*glycogen*. The concentration of glucose in the blood is maintained at around 5 mmol/l by a variety of hormones, principally *\*insulin* and *\*glucagon*. If the blood-glucose concentration falls below this level neurological and other symptoms may result (*see* HYPOGLYCAEMIA). Conversely, if the blood-glucose level is raised above its normal level, to 10

mmol/l, the condition of **\*hyperglycaemia** develops. This is a symptom of **\*diabetes mellitus**.

**glucose-6-phosphate dehydrogenase deficiency** a hereditary disorder – an X-linked condition (*see* **SEX-LINKED**) – in which the absence of the enzyme glucose-6-phosphate dehydrogenase (G6PD), which functions in carbohydrate metabolism, results in the breakdown of the red blood cells (**\*haemolysis**), usually after exposure to **\*oxidants**, such as drugs, or infections. The breakdown causes acute attacks that are characterized by pallor, loin pain, and rigors. There are several varieties of G6PD deficiency, which is most common in people of African, Middle Eastern, and Mediterranean descent. Treatment involves identifying and avoiding agents that trigger the haemolysis and treating acute attacks symptomatically. *See also* **FAVISM**.

**glucose tolerance test (oral glucose tolerance test, OGTT)** the gold-standard diagnostic test for diabetes mellitus and for **impaired glucose tolerance (IGT)** and **impaired fasting glucose (IFG)** (known as **prediabetes** or **abnormal glucose regulation**). The blood glucose level is measured after an overnight fast (water only) lasting at least 12 hours, and a second blood glucose level is measured 2 hours after a drink containing 75 g of glucose. The current WHO criteria for normal glucose tolerance is a fasting blood glucose level below 6.1 mmol/l and a two-hour blood glucose level below 7.8 mmol/l. Diabetes is diagnosed if the fasting level is above 7.0 mmol/l and/or the two-hour level is above 11.1 mmol/l. IGT is diagnosed when the fasting level is less than 7.0 mmol/l and the two-hour level is 7.0–11.1 mmol/l, and IFG when the fasting level is 6.0–7.0 mmol/l but the two-hour level is less than 7.8 mmol/l. People with IGT and IFG have a high risk of progression to type 2 diabetes over time.

**glucoside** *n. see* **GLYCOSIDE**.

**glucuronic acid** a sugar acid derived from glucose. Glucuronic acid is an important constituent of **\*chondroitin sulphate** (found in cartilage) and **\*hyaluronic acid** (found in synovial fluid).

**glue ear** a common condition in which viscous fluid accumulates in the middle ear, causing **\*deafness**. It is most frequently seen in children and is due to malfunction of the **\*Eustachian tube**. Many cases resolve

spontaneously; treatment, if required, consists of surgical incision of the eardrum (**\*myringotomy**), drainage of the fluid, and the insertion of a **\*grommet**. Alternatively, hearing aids may be used until spontaneous resolution occurs. Medical names: **otitis media with effusion**, **secretory otitis media**.

**glutamate dehydrogenase (glutamic acid dehydrogenase)** an important enzyme involved in the **\*deamination** of amino acids.

**glutamic acid (glutamate)** *see* **AMINO ACID**; **NEUROTRANSMITTER**.

**glutamic acid decarboxylase (GAD)** a common enzyme that, because of similarities to certain bacterial proteins, can provoke an autoimmune reaction against the beta cells of the pancreas (*see* **ISLET CELL ANTIBODIES**) progressing to type 1 **\*diabetes mellitus**.

**glutamic oxaloacetic transaminase (GOT)** *see* **ASPARTATE AMINOTRANSFERASE**.

**glutamic pyruvic transaminase (GPT)** *see* **ALANINE AMINOTRANSFERASE**.

**glutaminase** *n.* an enzyme, found in the kidney, that catalyses the breakdown of the amino acid glutamine to ammonia and glutamic acid: a stage in the production of urea.

**glutamine** *n.* *see* **AMINO ACID**.

**glutathione** *n.* a peptide containing the amino acids glutamic acid, cysteine, and glycine. It functions as a **\*coenzyme** in several oxidation-reduction reactions. Glutathione serves as an **\*antioxidant**: it reacts with potentially harmful oxidizing agents and is itself oxidized (*see also* **SELENIUM**). This is important in ensuring the proper functioning of proteins, haemoglobin, membrane lipids, etc. High levels of glutathione in the blood are associated with longevity.

**glutelin** *n.* one of a group of simple proteins found in plants and soluble only in dilute acids and bases. An example is **glutenin**, found in wheat (*see* **GLUTEN**).

**gluten** *n.* a mixture of the two proteins **gliadin** and **glutenin**. Gluten is present in wheat and rye and is important for its baking properties: when mixed with water it becomes sticky and enables air to be trapped and dough to be formed. Sensitivity to gluten leads to **\*coeliac disease** in children.

**gluteus** *n.* one of three paired muscles of the buttocks (**gluteus maximus**, **gluteus medius**, and **gluteus minimus**). They are responsible for movements of the thigh. —**gluteal** *adj.*

**glyc-** (**glyco-**) *combining form denoting sugar.*

**glycaemic index (GI)** a ranking system measuring the effect carbohydrate (CHO) ingestion has on blood glucose levels. Glucose is used as the standard reference value (50 g glucose has a GI of 100). A portion of food containing 50 g CHO is ingested and the effect on blood glucose levels measured over a three-hour period and compared with the effect of 50 g of glucose. Foods with a low GI (<60), such as apples, yoghurt, and beans, are slowly absorbed, causing a lower and more prolonged increase in blood glucose levels, than foods with a high GI (>70), e.g. white bread, white rice, and potatoes. Low GI foods help with diabetes control and may be beneficial in the treatment of **\*polycystic ovary syndrome**. The **glycaemic load (GL)** also takes into account the amount of food that is eaten:  $GL = (g \text{ CHO in food portion eaten} \times GI)/100$ .

**glycated haemoglobin (glycosylated haemoglobin)** any derivative of haemoglobin in which a glucose molecule is attached to the haemoglobin molecule. The most abundant form of glycated haemoglobin is **haemoglobin A<sub>1c</sub> (HbA<sub>1c</sub>)**, levels of which are significantly increased in diabetes. The percentage of the HbA molecules that become glycated is dependent on the general level of glucose in the plasma over the lifetime of the molecule (generally three months); this percentage is therefore used as the standard measure of the degree of control of **\*hyperglycaemia** in a person with diabetes over this period. HbA<sub>1c</sub> values are now expressed in mmol per mol haemoglobin (mmol/mol) rather than as a percentage. The use of HbA<sub>1c</sub> as a screening tool for diabetes mellitus has become recognized.

**glycation** *n.* the chemical linkage of glucose to a protein, to form a glycoprotein. Glycation of body proteins has been postulated as a cause of

complications of diabetes mellitus. *see* [ADVANCED GLYCATION END-PRODUCTS](#); [GLYCATED HAEMOGLOBIN](#).

**glyceride** *n.* a [\\*lipid](#) consisting of glycerol (an alcohol) combined with one or more fatty acids. *See also* [TRIGLYCERIDE](#).

**glycerin (glycerol)** *n.* a clear viscous liquid obtained by hydrolysis of fats and mixed oils and produced as a by-product in the manufacture of soap. It is used as an [\\*emollient](#) in many skin preparations, as a laxative (particularly in the form of [\\*suppositories](#)), and as a sweetening agent in the pharmaceutical industry.

**glyceryl trinitrate (nitroglycerin)** a drug that dilates blood vessels and is used mainly to prevent and treat angina (*see* [VASODILATOR](#)). Side effects may include flushing, headache, and fainting. Glyceryl trinitrate is also applied topically in the treatment of anal fissures.

**glycine** *n.* *see* [AMINO ACID](#).

**glycobiology** *n.* the study of the chemistry, biochemistry, and other aspects of carbohydrates and carbohydrate complexes, especially [\\*glycoproteins](#). Elucidation of the structure and role of the sugar molecules of glycoproteins has important medical implications and has led to the development of new drugs, such as [\\*tissue-type plasminogen activators](#), drugs that affect the immune system, and antiviral drugs.

**glycocholic acid** *see* [BILE ACIDS](#).

**glycogen** *n.* a carbohydrate consisting of branched chains of glucose units. Glycogen is the principal form in which carbohydrate is stored in the body: it is the counterpart of starch in plants. Glycogen is stored in the liver and muscles and may be readily broken down to glucose.

**glycogenesis** *n.* the biochemical process, occurring chiefly in the liver and in muscle, by which glucose is converted into glycogen.

**glycogenolysis** *n.* a biochemical process, occurring chiefly in the liver and in muscle, by which glycogen is broken down into glucose.

**glycolipid** *n.* a **\*lipid** containing a sugar molecule (usually galactose or glucose). The **\*cerebrosides** are examples of glycolipids.

**glycolysis** *n.* the conversion of glucose, by a series of ten enzyme-catalysed reactions, to lactic acid. Glycolysis takes place in the cytoplasm of cells and the first nine reactions (converting glucose to pyruvate) form the first stage of cellular **\*respiration**. The process involves the production of a small amount of energy (in the form of ATP), which is used for biochemical work. The final reaction of glycolysis (converting pyruvate to lactic acid) provides energy for short periods of time when oxygen consumption exceeds demand; for example, during bursts of intense muscular activity. *See also* **LACTIC ACID**.

**glycopeptide antibiotics** *see* **VANCOMYCIN**.

**glycoprotein** *n.* one of a group of compounds consisting of a protein combined with a carbohydrate (such as galactose or mannose). Examples of glycoproteins are certain enzymes, hormones, and antigens.

**glycopyrrhonium bromide** an **\*antimuscarinic** drug used as a maintenance bronchodilator to relieve symptoms in adults with COPD. It is administered by inhalation; side-effects include dry mouth. Trade name: **Seebri Breezhaler**.

**glycoside** *n.* a compound formed by replacing the hydroxyl (–OH) group of a sugar by another group. (If the sugar is glucose the compound is known as a **glucoside**.) Glycosides found in plants include some pharmacologically important products, such as the **cardiac glycoside** **\*digoxin**, derived from the foxglove (*Digitalis*). Other plant glycosides are natural food toxins, present in cassava, almonds, and other plant products, and may yield hydrogen cyanide if the plant is not prepared properly before eating.

**glycosuria** *n.* the presence of glucose in the urine in abnormally large amounts. Only very minute quantities of this sugar may be found normally in the urine. Higher levels may be associated with diabetes mellitus, kidney disease, and some other conditions.

**glycosylated haemoglobin** *see* **GLYCATED HAEMOGLOBIN**.

**GMC** *see* **GENERAL MEDICAL COUNCIL**.

**gnath-** (**gnatho-**) *combining form denoting the jaw.* Example: **gnathoplasty** (plastic surgery of).

**gnathion** *n.* the lowest point of the midline of the lower jaw (mandible).

**Gnathostoma** *n.* a genus of parasitic nematodes. Adult worms are commonly found in the intestines of tigers, leopards, and dogs. The presence of the larval stage of *G. spinigerum* in humans, who are not the normal hosts, causes a skin condition called **\*creeping eruption**.

**gnotobiotic** *adj.* describing germ-free conditions or a germ-free animal that has been inoculated with known microorganisms.

**GnRH** *see* **GONADOTROPHIN-RELEASING HORMONE**.

**GnRH analogue** *see* **GONADORELIN ANALOGUE**.

**goblet cell** a column-shaped secretory cell found in the **\*epithelium** of the respiratory and intestinal tracts. Goblet cells secrete the principal constituents of mucus.

**goitre** *n.* a swelling of the neck due to enlargement of the thyroid gland. This may be due to lack of dietary iodine, which is necessary for the production of thyroid hormone: the gland enlarges in an attempt to increase the output of hormone. This was the cause of **endemic goitre**, formerly common in regions where the diet lacked iodine. **Sporadic goitre** may be due to simple overgrowth (hyperplasia) of the gland or to a tumour. In **exophthalmic goitre** (**Graves' disease**) the swelling is associated with overactivity of the gland and is accompanied by other symptoms (*see* **THYROTOXICOSIS**). Autoimmune thyroiditis can be associated with goitre (*see* **HASHIMOTO'S DISEASE**).

**gold** *n.* **1.** a bright yellow metal that is very malleable. In dentistry pure gold is now very rarely used as a filling. Gold alloys are used for **\*crowns**, **\*inlays**, and **\*bridges**, either alone or veneered with a tooth-coloured material, but increasingly nonprecious alloys are being used. Gold alloys are now only rarely used as the metal framework for partial dentures, **\*cobalt-chromium** alloys being used instead. **2.** (in pharmacology) a compound of the metal gold, **sodium aurothiomalate**, used in the treatment of rheumatoid

arthritis. Side-effects may include blood disorders, severe skin rash and allergy, inflammation of the colon, and kidney damage. Because of this, its use has largely been replaced by methotrexate and biological therapies.

**GOLD (Global Initiative for Chronic Obstructive Lung Disease)** a body that works with health-care professionals and public health officials around the world to raise awareness of **\*chronic obstructive pulmonary disease** (COPD) and to improve prevention and treatment of this disease. The publication of management guidelines has had a significant impact on a change in treatment for this condition worldwide.

**Goldmann applanation tonometer** *see* **TONOMETER**. [H. Goldmann (1899–1991), Swiss ophthalmologist]

**golfer's elbow** inflammation of the origin of the common flexor tendon on the medial epicondyle of the **\*humerus** (medial epicondylitis), caused by overuse of the forearm muscles. Treatment is by rest, a brace, anti-inflammatory medication, or steroid injection. Avoidance of repetitive injury is also important. *Compare* **TENNIS ELBOW**.

**Golgi apparatus** a collection of vesicles and folded membranes in a cell, usually connected to the **\*endoplasmic reticulum**. It stores and later transports the proteins manufactured in the endoplasmic reticulum. The Golgi apparatus is well developed in cells that produce secretions, e.g. pancreatic cells producing digestive enzymes. [C. Golgi (1844–1926), Italian histologist]

**Golgi cells** types of **\*neurons** (nerve cells) within the central nervous system. **Golgi type I neurons** have very long axons that connect different parts of the system; **Golgi type II neurons**, also known as **microneurons**, have only short axons or sometimes none.

**Golgi tendon organ** *see* **TENDON ORGAN**.

**Gomori's method** a method of staining for the demonstration of enzymes, especially phosphatases and lipases, in histological specimens. [G. Gomori (1904–57), Hungarian histochemist]

**gomphosis** *n.* a form of **\*synarthrosis** (immovable joint) in which a conical process fits into a socket. An example is the joint between the root of a tooth

and the socket in the jawbone.

**gonad** *n.* a male or female reproductive organ that produces the gametes. *See* OVARY; TESTIS.

**gonadal dysgenesis** *see* TURNER'S SYNDROME.

**gonadarche** *n.* the period during which the gonads begin to secrete sex hormones, so triggering puberty. The timing for this event is controlled by the pituitary gland; gonadarche occurs usually between the ages of 10 and 11 in girls and 11 and 12 in boys.

**gonadorelin analogue (GnRH analogue, LHRH analogue)** any one of a group of analogues of **\*gonadotrophin-releasing hormone** (gonadorelin), which stimulates release of the gonadotrophins luteinizing hormone (LH) and follicle-stimulating hormone (FSH) from the pituitary gland. They are more powerful than the naturally occurring hormone, initially increasing the secretion of gonadotrophins by the pituitary: this acts to block the hormone receptors and to inhibit the release of further gonadotrophins, which suppresses production of oestrogens and androgens. Gonadorelin analogues include **\*buserelin**, **\*goserelin**, **leuprorelin**, and **triptorelin**. They are used in the treatment of endometriosis, fibroids, and some types of infertility. GnRH analogues are also used in the treatment of advanced prostate cancer. After causing an initial rise in plasma testosterone for approximately ten days the level then falls to the same low level as that achieved by castration. Because the initial flare in testosterone may cause an acute enlargement of the cancer, **\*anti-androgens** are given usually for the first two weeks following the first injection of the gonadorelin analogue.

**gonadotrophin (gonadotrophic hormone)** *n.* any of several hormones synthesized and released by the pituitary gland that act on the testes or ovaries (gonads) to promote production of sex hormones and either sperm or ova. Their production is controlled by **\*gonadotrophin-releasing hormone**. The main gonadotrophins are **\*follicle-stimulating hormone** and **\*luteinizing hormone**. They may be given by injection to treat infertility. *See also* HUMAN CHORIONIC GONADOTROPHIN.

**gonadotrophin-releasing hormone (GnRH, gonadorelin)** a peptide hormone produced in the hypothalamus and transported via the bloodstream

to the pituitary gland, where it controls the synthesis and release of pituitary **\*gonadotrophins**. It may be used to test the ability of the pituitary to produce gonadotrophins. **\*Gonadorelin analogues** are used to treat endometriosis, fibroids, some types of infertility, and prostate cancer.

**gonagra** *n.* gout in the knee.

**goni-** (**gonio-**) *combining form denoting* an anatomical angle or corner.

**goniometer** *n.* an instrument for measuring angles, such as those made in joint movements.

**gonion** *n.* the point of the angle of the lower jawbone (mandible).

**gonioscope** *n.* a special kind of diagnostic contact lens used for viewing the structures at the angle of the anterior chamber of the eye (in front of the iris). These structures, at the periphery of the cornea, are not accessible to direct viewing.

**goniotomy (trabeculotomy)** *n.* a primary surgical procedure for treating congenital glaucoma (see **BUPHTHALMOS**). A fine knife is used to make an incision into the blocked **\*trabecular meshwork** from within the eye, thus creating an opening through which the aqueous fluid can drain.

**gonococcus** *n.* (*pl.* **gonococci**) the causative agent of gonorrhoea: the bacterium **\*Neisseria gonorrhoeae**. —**gonococcal** *adj.*

**gonocyte** *n.* see **GERM CELL**.

**gonorrhoea** *n.* a sexually transmitted disease, caused by the bacterium *Neisseria gonorrhoeae*, that affects the genital mucous membranes of either sex. Symptoms develop about a week after infection and include pain on passing urine and discharge of pus (known as **gleet**) from the penis (in men) or vagina (in women); some infected women, however, experience no symptoms. If a pregnant woman has gonorrhoea, her baby's eyes may become infected during passage through the birth canal (see **OPHTHALMIA NEONATORUM**). In untreated cases, the infection may spread throughout the reproductive system, causing sterility; severe inflammation of the urethra in men can prevent passage of urine (a condition known as **\*stricture**). Later complications include arthritis, inflammation of the heart valves

(\*[endocarditis](#)), and infection of the eyes, causing conjunctivitis. Treatment with ciprofloxacin, ofloxacin, or cefotaxime is usually effective.

**good** *adj.* positive, desirable, or morally admirable. The question of what is to be judged good is at the heart of medical ethics and ethics in general. Some theorists believe that one's intentions or will may or may not be good (see [DEONTOLOGY](#)), while others argue that only the consequences of actions may or may not be good (\*[consequentialism](#)). Physicians have an explicit duty to do good for their patients (see [BENEFICENCE](#)). *See also* [RIGHT](#).

**good enough** adequate or satisfactory, particularly when applied to the quality of parental care. The term was introduced by the paediatrician and psychoanalyst Donald Winnicott to discourage professionals from imposing an impossible level as the threshold of adequacy.

**Goodpasture's disease** a rare autoimmune illness with production of antibodies directed against the glomerular basement membrane (anti-GBM antibodies). Classically patients present with lung haemorrhage and a rapidly progressive glomerulonephritis. Most cases will respond to aggressive treatment with plasma exchange and immunosuppression. [E. W. Goodpasture (1886–1960), US pathologist]

**Goodpasture's syndrome** any of various rare illnesses characterized by primary lung haemorrhage and rapidly progressive glomerulonephritis. They include \*[Goodpasture's disease](#) and, more commonly, the systemic vasculitides (see [VASCULITIS](#)).

**gooseflesh** *n.* the reaction of the skin to cold or fear. The blood vessels contract and the small muscle attached to the base of each hair follicle also contracts, causing the hairs to stand up: this gives the skin an appearance of plucked goose skin.

**GORD** *see* [GASTRO-OESOPHAGEAL REFLUX DISEASE](#).

**Gordon's syndrome (pseudohypoaldosteronism type II, chloride shunt syndrome)** an autosomal \*[dominant](#) condition associated with increased chloride absorption in the distal tubule leading to a syndrome of mild volume expansion, hypertension, and metabolic acidosis with otherwise normal renal

function. Plasma **\*renin** and **\*aldosterone** are suppressed as a result of the volume expansion. Other features can include short stature, intellectual impairment, muscle weakness, and renal stones.

**gorget** *n.* an instrument formerly used in the operation for removal of stones from the bladder. It is a **\*director** or guide with a wide groove.

**Gorlin's syndrome** a genetic condition characterized by disorders of the skin, bones, and nervous system, with a markedly increased risk of developing multiple **\*basal cell carcinomas**. [R. J. Gorlin (1923– ), US pathologist]

**goserelin** *n.* a **\*gonadorelin analogue** that is used in the treatment of endometriosis, prostate cancer, breast cancer, and fibroids. It is also used in the treatment of infertility by in vitro fertilization.

**Gottron's papules** *see* DERMATOMYOSITIS.

**Gott shunt** a heparin-bonded shunt used to bypass sections of aorta that are being operated on. It is one of several shunts used in operations on the heart and arteries.

**gouge** *n.* a curved chisel used in orthopaedic operations to cut and remove bone.

**goundou (anákhre)** *n.* a condition following an infection with **\*yaws** in which the nasal processes of the upper jaw bone thicken (*see* **HYPEROSTOSIS**) to form two large bony swellings, about 7 cm in diameter, on either side of the nose. The swellings not only obstruct the nostrils but also interfere with the field of vision. Initial symptoms include persistent headache and a bloody purulent discharge from the nose. Early cases can be treated with injections of penicillin; otherwise surgical removal of the growths is necessary. Goundou occurs in central Africa and South America.

**gout** *n.* a disease in which a defect in purine metabolism causes an excess of uric acid and its salts (urates) to accumulate in the bloodstream and the joints respectively. It results in attacks of acute gouty arthritis and chronic destruction of the joints and deposits of urates (**tophi**) in the skin and cartilage, especially of the ears. The excess of urates also damages the kidneys, in which stones may form. Long-term treatment with drugs that

increase the excretion of urates (*\*uricosuric drugs*), or with urate-lowering therapy, such as, *\*allopurinol* or *\*febuxostat*, can control the joint disease. Urate-lowering therapy may also help with urate stones, but uricosurics are not used as they can precipitate uric acid stones by increasing uric acid excretion in the urine. Acute attacks of gout are treated with anti-inflammatory analgesics, colchicine, or corticosteroids. *See also* **PODAGRA**.

**governance** *n.* the use of political power or authority to set, monitor, and enforce standards within systems or organizations. Within the UK National Health Service, there are two principal governance frameworks within which health-care professionals must work: *\*clinical governance* and **research governance**.

**GPA** *see* **GRANULOMATOSIS WITH POLYANGIITIS**.

**Graafian follicle** a mature follicle in the ovary prior to ovulation, containing a large fluid-filled cavity that distends the surface of the ovary. The *\*oocyte* develops inside the follicle, attached to one side. [R. de Graaf (1641–73), Dutch physician and anatomist]

**grade** *n.* **1.** the severity of a malignant tumour according to its degree of *\*differentiation*. Low-grade tumours (grade 1) closely resemble normal tissues, are well differentiated, and have a good prognosis. High-grade tumours (grade 3) show a poor resemblance to normal tissues, are poorly differentiated, and have a poor prognosis. Benign tumours are not graded. **2.** the severity of a non-neoplastic disease.

**graded self-exposure** a technique used in the *\*behaviour therapy* of phobias. A hierarchy of fears (increasingly fearful stimuli) is set up and the patients expose themselves to each level of the hierarchy in turn. Exposure continues until *\*habituation* occurs; the patient then proceeds to the next highest level of the hierarchy. The patient is ultimately able to cope with the feared object or situation.

**graft** **1.** *n.* any organ, tissue, or object used for *\*transplantation* to replace a faulty part of the body. A *\*skin graft* is used to heal a damaged area of skin. A *\*bone graft* can be performed using natural bone or a synthetic material. A kidney removed from a live or dead person and transplanted to another individual is described as a **kidney (or renal) graft**. Corneal grafts are taken

from a recently dead individual to repair corneal opacity (*see* **KERATOPLASTY**). Diseased coronary arteries may be replaced by a *\*coronary artery bypass graft*. Artificial grafts are used to replace diseased peripheral arteries and heart valves. **2.** *vb.* to transplant an organ or tissue. *See also* **ALLOGRAFT**; **XENOGRAFT**.

**graft-versus-host disease (GVHD)** a condition that occurs following bone marrow transplantation and sometimes blood transfusion, in which lymphocytes from the graft attack specific tissues in the host. The skin, gut, and liver are the most severely affected. Drugs that suppress the immune reaction, such as steroids and *\*ciclosporin*, and antibodies directed against lymphocytes reduce the severity of the tissue damage.

**Graham Steell murmur** a soft high-pitched heart *\*murmur* best heard over the second left intercostal space in early *\*diastole*. It is a sign of *\*pulmonary regurgitation*. [Graham Steell (1851–1942), British physician]

**grain** *n.* a unit of mass equal to 1/7000 of a pound (avoirdupois). 1 grain = 0.0648 gram.

**gram** *n.* a unit of mass equal to one thousandth of a kilogram. Symbol: g.

**-gram** *combining form denoting* a record; tracing. Example: **electrocardiogram** (record of an electrocardiograph).

**Gram's stain** a method of staining bacterial cells, used as a primary means of identification. A film of bacteria spread onto a glass slide is dried and heat-fixed, stained with a violet dye, treated with decolourizer (e.g. alcohol), and then counterstained with red dye. **Gram-negative** bacteria lose the initial stain but take up the counterstain, so that they appear red microscopically. **Gram-positive** bacteria retain the initial stain, appearing violet microscopically. These staining differences are based on variations in the structure of the cell wall in the two groups. [H. C. J. Gram (1853–1938), Danish physician]

**grand mal (major epilepsy)** *see* **EPILEPSY**.

**grand multiparity** the condition of a woman who has had five or more previous pregnancies. Such women are more prone to fetal malpresentations, postpartum haemorrhage, and rupture of the uterus.

**granisetron** *n.* see **ONDANSETRON**.

**granular cast** a cellular **\*cast** derived from a kidney tubule. In certain kidney diseases, notably acute **\*glomerulonephritis**, abnormal collections of renal tubular cells are shed from the kidney, often as a cast of the tubule. The casts can be observed on microscopic examination of the centrifuged deposit of a specimen of urine. Their presence in the urine indicates continued activity of the disease.

**granulation** *n.* the formation of a multicellular mass of tissue (**granulation tissue**) in response to an injury: this is an essential part of the healing process. Granulation tissue contains many new blood vessels and, in its later stages, large numbers of fibroblasts. The response is most frequently seen in healing open wounds and in the bases of ulcers.

**granulocyte** *n.* any of a group of white blood cells that, when stained with **\*Romanowsky stains**, are seen to contain granules in their cytoplasm. They can be subclassified on the basis of the colour of the stained granules into **\*neutrophils**, **\*eosinophils**, and **\*basophils**.

**granulocytopenia** *n.* a reduction in the number of **\*granulocytes** (a type of white cell) in the blood. See **NEUTROPENIA**.

**granuloma** *n.* (*pl.* **granulomata** or **granulomas**) a localized collection of cells, usually produced in response to an infectious process, that is characterized by the presence of aggregates of epithelioid **\*histiocytes**; giant cells, monocytes, or lymphocytes may also be present. The types of cells comprising a granuloma (of which there may be many or few) and their arrangement can assist in diagnosing the cause of the response; this is important in the diagnosis of tuberculosis, sarcoidosis, Crohn's disease, and the presence of certain foreign bodies (e.g. starch, talc). Other conditions giving rise to granulomata include syphilis, leprosy, and coccidioidomycosis, and a granuloma may also occur around the apex of a tooth root as a result of inflammation or infection of its pulp. —**granulomatous** *adj.*

**granuloma annulare** a chronic skin condition of unknown cause, which may lie on a disease spectrum with **\*necrobiosis** lipoidica. In the common localized type there is a ring or rings of closely set papules, 1–5 cm in

diameter, found principally on the hands and arms. The association with diabetes mellitus is controversial.

**granuloma gravidarum** *see* **PREGNANCY EPULIS**.

**granuloma inguinale** an infectious disease caused by *Calymmatobacterium granulomatis*, which is transmitted during sexual intercourse. A pimply rash on and around the genital organs develops into a granulomatous ulcer. The disease responds to treatment with tetracyclines and streptomycin.

**granulomatosis** *n.* any condition marked by multiple widespread **\*granulomata**. *See also* **GRANULOMATOSIS WITH POLYANGIITIS**.

**granulomatosis with polyangiitis (GPA)** an autoimmune disease, formerly known as **Wegener's granulomatosis**, predominantly affecting the sinuses, lungs, and kidneys, and characterized by blood-vessel inflammation and the formation of necrotizing **\*granulomas**. It is associated with the presence of antineutrophil cytoplasmic antibodies (**\*ANCA**). Untreated the disease is usually fatal, but it can be controlled with corticosteroids, cyclophosphamide, or rituximab.

**granulopoiesis** *n.* the process of production of **\*granulocytes**, which normally occurs in the blood-forming tissue of the **\*bone marrow**. Granulocytes are ultimately derived from a **\*haemopoietic stem cell**, but the earliest precursor that can be identified microscopically is the **\*myeloblast**. This divides and passes through a series of stages of maturation termed respectively **\*promyelocyte**, **\*myelocyte**, and **\*metamyelocyte**, before becoming a mature granulocyte. *See also* **HAEMOPOIESIS**.

**granzyme** *n.* a **\*protease** enzyme that is released by **\*cytotoxic T cells** and **\*natural killer cells** to induce death of virus-infected target cells.

**graph- (grapho-)** *combining form denoting* handwriting.

**-graph** *combining form denoting* an instrument that records. Example: **electrocardiograph** (instrument recording heart activity).

**graphology** *n.* the study of the characteristics of handwriting to obtain indications about a person's psychological make-up or state of health. It is

possible to detect certain signs of physical disease, such as fine nervous tremors or irregularity of the pulse.

**grasp reflex** involuntary grasping in response to anything that touches the palm of the hand. This is a normal reflex in babies that is lost in early childhood. In adults it is a sign of damage to the **\*prefrontal lobes** of the brain.

**grattage** *n.* the process of brushing or scraping the surface of a slowly healing ulcer or wound to remove **\*granulation** tissue, which – though a stage in the healing process – sometimes overgrows or becomes infected and therefore delays healing. Grattage is used in the treatment of **\*trachoma**.

**gravel** *n.* small stones formed in the urinary tract. The stones usually consist of calcareous debris or aggregations of other crystalline material. The passage of gravel from the kidneys is usually associated with severe pain (**ureteric colic**) and may cause blood in the urine. *See also* **CALCULUS**.

**Graves' disease (exophthalmic goitre)** *see* **THYROTOXICOSIS**. [R. J. Graves (1797–1853), Irish physician]

**gravid** *adj.* currently pregnant. The term **gravidity** is used to indicate the total number of pregnancies a woman has had, including the current pregnancy, previous live births, stillbirths, miscarriages, and abortions. *Compare* **PARITY**.

**Grawitz tumour** *see* **RENAL CELL CARCINOMA**. [P. A. Grawitz (1850–1932), German pathologist]

**gray** *n.* the **\*SI unit** of absorbed dose of ionizing radiation, being the absorbed dose when the energy per unit mass imparted to matter by ionizing radiation is 1 joule per kilogram. It has replaced the rad. Symbol: Gy.

**green monkey disease** *see* **MARBURG DISEASE**.

**greenstick fracture** an incomplete break in a bone in which part of the outer shell (cortex) remains intact. It occurs in children, who have more flexible bones. *See also* **FRACTURE**.

**grey matter** the darker coloured tissues of the central nervous system, composed mainly of the cell bodies of neurons, branching dendrites, and

glial cells (*compare* [WHITE MATTER](#)). In the brain grey matter forms the [\\*cerebral cortex](#) and the outer layer of the cerebellum; in the spinal cord the grey matter lies centrally and is surrounded by white matter.

**grey scale** (in radiology) a scale representing the possible gradient of densities from black to white for each [\\*pixel](#) in an image. In an [\\*analogue image](#) this gradient is smooth. A [\\*digital image](#) has many discrete steps. The more steps allowed, the closer to representing the true analogue image it comes, although more steps require more computer memory. Images can be manipulated by [\\*windowing](#). This concept is particularly valuable in [\\*computerized tomography](#). *See* [HOUNSFIELD UNIT](#); [DIGITIZATION](#).

**Grey Turner sign** a bluish bruiselike appearance around the flanks, which is seen in acute [\\*pancreatitis](#). [G. Grey Turner (1877–1951), British surgeon]

**gridiron incision** an oblique incision made in the right lower quadrant of the abdomen, classically used for [\\*appendectomy](#).

**gripe** *n.* spasmodic abdominal pain or discomfort (*see* [COLIC](#)).

**griseofulvin** *n.* an antifungal drug administered by mouth or topically to treat fungal infections of the hair, skin, and nails, such as ringworm. Mild and temporary side-effects such as headache, skin rashes, and digestive upsets may occur.

**groin** *n.* the external depression on the front of the body that marks the junction of the abdomen with either of the thighs. *See also* [INGUINAL](#).

**grommet** *n.* a flanged metal or plastic tube that is inserted in the eardrum in cases of [\\*glue ear](#). It allows air to enter the middle ear, bypassing the patient's own nonfunctioning [\\*Eustachian tube](#).

**ground substance** the matrix of [\\*connective tissue](#), in which various cells and fibres are embedded.

**group B streptococcus (GBS)** a Gram-positive bacterium that causes life-threatening infections in newborn infants following vaginal delivery (*see* [STREPTOCOCCUS](#); [LANCEFIELD CLASSIFICATION](#)). 20% of pregnant women are carriers and have no symptoms; however, [\\*vertical transmission](#) of the bacterium from mother to fetus at the time of delivery may lead to

neonatal sepsis, characterized by pneumonia, meningitis, and death in some cases. Antibiotic prophylaxis with penicillin during labour is recommended for women with risk factors or who are known to be carriers.

**group practice** *see* [GENERAL PRACTITIONER](#).

**group therapy 1. (group psychotherapy)** *\*psychotherapy* involving at least two patients and a therapist. The patients are encouraged to understand and to analyse their own and one another's problems. *See also* [PSYCHODRAMA](#). **2.** therapy in which people with the same problem, such as *\*alcoholism* or *\*phobias*, meet and discuss together their difficulties and possible ways of overcoming them.

**growth factor** any of various chemicals, particularly polypeptides, that have a variety of important roles in the stimulation of new cell growth and cell maintenance. They bind to the cell surface on receptors and are potential targets for anticancer therapy (*see* [EPIDERMAL GROWTH FACTOR RECEPTOR](#)). Specific growth factors can cause new cell proliferation (e.g. *\*transforming growth factor*, **epidermal growth factor**, **haemopoietic growth factor**) and the migration of cells (**fibroblast growth factor**) and play a role in wound healing (**platelet-derived growth factor**; PDGF). Some growth factors act in the embryonic stage of development; for example, *\*nerve growth factor*. Some growth factors that induce cell proliferation are involved in the abnormal regulation of growth seen in cancer when produced in excessive amounts (e.g. **insulin-like growth factor, IGF-I**). Growth factors produced locally around a carcinoma (e.g. *\*vascular endothelial growth factor*) are important in the encouragement of invasion by the tumour; other factors (e.g. autocrine motility factor, migration-stimulating factor) are also significant. *See also* [BONE GROWTH FACTORS](#).

**growth hormone (GH, somatotrophin)** a hormone, synthesized and stored in the anterior pituitary gland, that promotes growth of the long bones in the limbs and increases protein synthesis (via *\*somatomedin*). Its release is controlled by the opposing actions of **growth-hormone releasing hormone** and *\*somatostatin*. Excessive production of growth hormone results in *\*gigantism* before puberty and *\*acromegaly* in adults. Lack of growth hormone in children causes *\*dwarfism*. Synthetic human growth hormone (**somatotropin**) is used to treat a variety of conditions of growth-hormone

deficiency. **Pegvisomant** is an analogue of human growth hormone that blocks GH receptors; it may be used to treat acromegaly.

**growth plate** *see* **PHYSIS**.

**grumous** *adj.* coarse; lumpy; clotted; often used to describe the appearance of the centre of wounds or diseased cells or the surface of a bacterial culture.

**guanethidine** *n.* a drug that is occasionally used for the rapid reduction of high blood pressure resistant to other treatments (*see* **SYMPATHOLYTIC**). Common side-effects are diarrhoea, faintness, and headache.

**guanine** *n.* one of the nitrogen-containing bases (*see* **PURINE**) that occurs in the nucleic acids DNA and RNA.

**guanosine** *n.* a compound containing guanine and the sugar ribose. *See also* **NUCLEOTIDE**.

**gubernaculum** *n.* (*pl.* **gubernacula**) either of a pair of fibrous strands of tissue that connect the gonads to the inguinal region in the fetus. In the male they guide and possibly move the testes into the scrotum before birth. In the female the ovaries descend only slightly within the abdominal cavity and the gubernacula persist as the round ligaments connecting the ovaries and uterus to the abdominal wall.

**guidewire** *n.* wire used as a guide to insert a catheter during interventional procedures, particularly in the **\*Seldinger technique**. Guidewires often have multiple cores and a variety of coverings, depending on their functions, and they vary in stiffness and thickness. Their ends may be curved, to get past tight strictures, or J-shaped, to avoid accidentally puncturing a vessel wall or other structure while being pushed forward.

**Guillain–Barré syndrome (postinfective polyneuropathy)** a disease of the peripheral nerves in which there is numbness and weakness in the limbs. It usually develops 1–28 days after a respiratory or gastrointestinal infection (commonly with *Campylobacter*): antibodies directed against the pathogen's cell-surface antigens attack similar antigens on the myelin sheaths of the host's peripheral nerves. Involvement of the respiratory muscles may require mechanical ventilation. Recovery is variable and often prolonged (there is a 10% mortality rate). Treatment with immunoglobulins (intravenous) or with

plasma exchange may speed recovery and reduce long-term disability. *See* [POLYRADICULITIS](#). [G. Guillain (1876–1961) and A. Barré (1880–1967), French neurologists]

**guillotine** *n.* (in surgery) **1.** an instrument used for removing the tonsils. It is loop-shaped and contains a sliding knife blade. **2.** an encircling suture to control the escape of fluid or blood from an orifice or to close a gap.

**guinea worm** a nematode worm, *Dracunculus medinensis*, that is a parasite of humans. The white threadlike adult female, 60–120 cm long, lives in the connective tissues beneath the skin. It releases its larvae into a large blister on the legs or arms; when the limbs are immersed in water the larvae escape and are subsequently eaten by tiny water fleas (*Cyclops*), inside which their development continues. The disease [\\*dracontiasis](#) results from drinking water contaminated with *Cyclops*.

**Gulf War syndrome** a variety of symptoms, mainly neurological (including chronic fatigue, dizziness, amnesia, digestive upsets, and muscle wasting), that have been attributed to exposure of armed forces personnel to chemicals (e.g. insecticides) used during the Gulf War (1991) or possibly to the effects of vaccines and tablets given to protect personnel against the anticipated threat of chemical and biological warfare during the conflict. Medical research into the syndrome is continuing.

**gullet** *n.* *see* [OESOPHAGUS](#).

**gum** *n.* (in anatomy) *see* [GINGIVA](#).

**gumboil** *n.* the opening on the surface of the gum of a [\\*sinus](#) tract from a chronic abscess arising from bacterial infection. It may be accompanied by varying degrees of swelling, pain, and discharge.

**gumma** *n.* a small soft tumour, characteristic of the tertiary stage of [\\*syphilis](#), that occurs in connective tissue, the liver, brain, testes, heart, or bone.

**gumshield** *n.* a soft flexible appliance that fits over and covers the teeth for protection in contact sports. The best are custom-made to fit the individual.

**gunshot wound** a common cause of both military and civil injuries. Gunshot wounds are usually produced by high-velocity missiles: deep-seated tissue destruction of thermal origin is a major complication.

**gustation** *n.* the sense of taste or the act of tasting.

**gustatory** *adj.* relating to the sense of taste or to the organs of taste.

**gut** *n.* **1.** *see* **INTESTINE**. **2.** *see* **CATGUT**.

**Guthrie test (heel-prick blood test)** a blood test performed on all newborn babies at the end of the first week of life. The blood is obtained by pricking the heel of the baby. The test can detect several **\*inborn errors of metabolism** (including **\*phenylketonuria**) and **\*hypothyroidism**; it can also be used for detecting **\*cystic fibrosis**, although this is not routinely offered. [R. Guthrie (1916–95), US paediatrician]

**gut microbiota** *n.* the microbe population living in the intestine (sometimes formerly called **gut flora**).

**gutta** *n.* (*pl.* **guttae**) (in pharmacy) a drop. Drops are the form in which medicines are applied to the eyes and ears.

**gutta-percha** *n.* a tough plastic substance derived from the latex of several Malaysian trees of the *sapodilla* family. It is hard at room temperature but becomes soft and plastic when heated. On cooling, gutta-percha will retain any shape imparted to it when hot. It is used in dentistry in the form of gutta-percha points as the principal core of **\*root fillings**.

**guttate** *adj.* describing lesions in the skin that are shaped like drops.

**GVHD** *see* **GRAFT-VERSUS-HOST DISEASE**.

**gyn-** (**gyno-**, **gynaec(o)-**) *combining form denoting* women or the female reproductive organs.

**gynaecology** *n.* the study of diseases of women and girls, particularly those affecting the female reproductive system. *Compare* **OBSTETRICS**. —

**gynaecological** *adj.* — **gynaecologist** *n.*

**gynaecomastia** *n.* enlargement of the breasts in the male, due either to hormone imbalance or to drug (e.g. hormone) therapy.

**gypsum** *n.* *see* **PLASTER OF PARIS**.

**gyr-** (**gyro-**) *combining form denoting* **1.** a gyrus. **2.** a ring or circle.

**gyrate atrophy** a rare hereditary condition causing night blindness and constricted visual fields, usually developing in the first decade of life. Clinically it is characterized by a progressive atrophy of the choroid and retina.

**gyrus** *n.* (*pl.* **gyri**) a raised convolution of the **\*cerebral cortex**, between two sulci (clefts).

**H1N1** *see* SWINE INFLUENZA.

**H<sub>2</sub>-receptor antagonist** *see* ANTIHISTAMINE.

**H5N1** *see* AVIAN INFLUENZA.

**Haab's striae** splits or tears in **\*Descemet's membrane** occurring during infancy, commonly as a result of congenital glaucoma. [O. Haab (1850–1931), German ophthalmologist]

**habit** *n.* a sequence of learned behaviour occurring in a particular context or as a response to particular events. Habits are often the result of **\*conditioning**, are performed automatically and unconsciously, and reduce decision-making. Habits, once established, often persist after the original causal factors no longer operate. Behavioural psychology is based on the premise that one form of conditioning can be replaced by another.

**habituation** *n.* **1.** (in psychology) a simple type of learning consisting of a gradual waning response by the subject to a continuous or repeated stimulus that is not associated with **\*reinforcement**. **2.** (in pharmacology) the condition of being psychologically dependent on a drug, following repeated consumption, marked by reduced sensitivity to its effects and a craving for the drug if it is withdrawn. *See also* **DEPENDENCE**.

**habitus** *n.* an individual's general physical appearance, especially when this is associated with a constitutional tendency to a particular disease.

**haem** *n.* an iron-containing compound (a **\*porphyrin**) that combines with the protein globin to form **\*haemoglobin**, found in the red blood cells.

**haem-** (**haema-**, **haemo-**, **haemat(o)-**) *combining form denoting blood.* Examples: **haematogenesis** (formation of); **haemophobia** (fear of).

**haemagglutination** *n.* the clumping of red blood cells (*see* **AGGLUTINATION**). It is caused by an antibody–antigen reaction or some viruses and other substances.

**haemagglutinin (HA, H)** a glycoprotein projecting from the surface layer of the lipid bilayer envelope of **\*influenza** virions. This protein is involved in virus binding and may influence virulence. It is a key target for antibody attack and therefore is important in vaccination.

**haemangioblastoma (Lindau's tumour)** *n.* a tumour of the brain or spinal cord arising in the blood vessels of the meninges or brain. It is often associated with **\*phaeochromocytoma** and **\*syringomyelia**. *See also* **VON HIPPEL-LINDAU DISEASE**.

**haemangioma** *n.* a benign tumour of blood vessels. It often appears on the skin as a type of birthmark; the strawberry **\*naevus** is an example. *See also* **ANGIOMA**.

**Haemaphysalis** *n.* a genus of hard **\*ticks**. Certain species transmit tick **\*typhus** in the Old World; *H. spinigera* transmits the virus causing **\*Kyasanur Forest disease** in India.

**haemarthrosis** *n.* bleeding within a joint, which may follow injury or may occur spontaneously in bleeding disorders, such as **\*haemophilia**. It is usually associated with swelling, warmth, and pain in the affected joint. Treatment includes immobilization, pressure bandaging, and correction of the blood disorder (if present). Aspiration of blood from a joint that is tensely swollen may relieve the pain.

**haematemesis** *n.* the act of vomiting fresh blood. The blood may have been swallowed (e.g. following a nosebleed or tonsillectomy) but more often arises from bleeding in the oesophagus, stomach, or duodenum. Common causes of upper gastrointestinal bleeding are **\*oesophageal varices** or peptic ulcers. Vomited blood needs to be replaced by transfused blood. Gastroscopy may identify the source of bleeding and enables endoscopic treatments to arrest it. These include adrenaline injection, thermocoagulation with a

**\*heater-probe** or by **\*argon plasma coagulation**, band ligation of oesophageal varices, glue injection for gastric varices, and the placement of metallic clips (endoclips) on bleeding vessels.

**haemathidrosis (haematidrosis)** *n.* see **HAEMATOHIDROSIS**.

**haematin** *n.* a chemical derivative of **\*haemoglobin** formed by removal of the protein part of the molecule and oxidation of the iron atom from the ferrous to the ferric form.

**haematinic** *n.* a drug that increases the amount of **\*haemoglobin** in the blood, e.g. **\*ferrous sulphate** and other iron-containing compounds. Haematinics are used, often in combination with vitamins and folic acid, to prevent and treat anaemia due to iron deficiency. They are used particularly to prevent anaemia during pregnancy. Digestive disturbances sometimes occur with haematinics.

**haematochesia** *n.* the passage of fresh red blood through the rectum. Haematochesia occurs in patients with haemorrhoids, colorectal carcinoma, colitis, diverticulitis, angiodysplasia, and volvulus. Haematochesia also occurs as a result of severe haemorrhage in the upper gastrointestinal tract.

**haematocoele** *n.* a swelling caused by leakage of blood into a cavity, especially that of the tunica vaginalis, the membrane overlying the front and sides of the **\*testis**. A **pelvic haematocoele** is a swelling near the uterus formed by the escape of blood, usually from a Fallopian tube in ectopic pregnancy.

**haematocolpos** *n.* distention of the vagina with blood due to an **\*imperforate** hymen. See **CRYPTOMENORRHOEA**.

**haematocrit** *n.* see **PACKED CELL VOLUME**.

**haematocyst** *n.* a cyst that contains blood.

**haematogenous (haematogenic)** *adj.* **1.** relating to the production of blood or its constituents; haematopoietic. **2.** produced by, originating in, or carried by the blood.

**haematohidrosis (haemathidrosis, haematidrosis)** *n.* the secretion of sweat containing blood.

**haematology** *n.* the study of blood and blood-forming tissues and the disorders associated with them. —**haematological** *adj.* —**haematologist** *n.*

**haematoma** *n.* an accumulation of blood within the tissues that clots to form a solid swelling. Injury, disease of the blood vessels, or a clotting disorder of the blood are the usual causative factors. An **intracranial haematoma** causes symptoms by compressing the brain and by raising the pressure within the skull. A blunt injury to the head, especially the temple, may tear the middle meningeal artery, giving rise to a rapidly accumulating **extradural haematoma** requiring urgent surgical treatment. In elderly people a relatively slight head injury may tear the veins where they cross the space beneath the dura, giving rise to a **subdural haematoma**. Excellent results are obtained by surgical treatment. An **intracerebral haematoma** may be a consequence of severe head injury but is more often due to atheromatous disease of the cerebral arteries and high blood pressure resulting in bleeding into the brain. *See also* [PERIANAL HAEMATOMA](#).

**haematometra** *n.* **1.** accumulation of menstrual blood in the uterus. **2.** any abnormally copious bleeding in the uterus.

**haematomyelia** *n.* bleeding into the tissue of the spinal cord. This may result in acutely developing symptoms that mimic [\\*syringomyelia](#).

**haematopoiesis** *n.* *see* [HAEMOPOIESIS](#).

**haematoporphyrin** *n.* a type of [\\*porphyrin](#) produced during the metabolism of haemoglobin.

**haematosalpinx** (**haemosalpinx**) *n.* the accumulation of menstrual blood in the [\\*Fallopian tubes](#).

**haematospermia** *n.* the occurrence of blood in the semen, which may be due to one of several benign or malignant urological conditions.

**haematoxylin** *n.* a colourless crystalline compound extracted from logwood (*Haematoxylon campechianum*) and used in various histological stains. When oxidized haematoxylin is converted to **haematein**, which imparts a blue colour to certain parts of cells, especially cell nuclei. **Heidenhain's iron haematoxylin** is used to stain sections that are to be photographed, since it gives great clarity at high magnification.

**haematuria** *n.* the passage of blood in the urine. This may be seen by the naked eye (**frank, macroscopic, or visible haematuria**) or detected by urine microscopy or urine dipstick (**microscopic or nonvisible haematuria**) The latter is subclassified into symptomatic nonvisible or asymptomatic nonvisible haematuria. Haematuria is a very important symptom because it is associated with **\*transitional cell carcinoma**, most commonly in the bladder, and kidney cancer. It may also be due to urinary-tract infections, stone disease, or some forms of **\*glomerulonephritis**.

**haemin** *n.* a chemical derivative of haemoglobin formed by removal of the protein part of the molecule, oxidation of the iron atom, and combination with an acid to form a salt (*compare* **HAEMATIN**). **Chlorohaemin** forms characteristic crystals, the identification of which provides the basis of a chemical test for blood stains.

**haemo-** *combining form. see* **HAEM-**.

**Haemobartonella** *n. see* **BARTONELLA**.

**haemobilia** *n.* haemorrhage into the bile ducts, usually presenting as an acute upper gastrointestinal bleed (with bloody vomit or **\*melaena**) or with a dropping blood count. The most common causes are liver injury, liver biopsy, hepatobiliary surgery, or use of instruments (such as **\*ERCP**). Other causes include gallstones, inflammatory conditions, vascular abnormalities, tumours, and conditions that predispose to bleeding (such as using anticoagulant medication).

**haemochromatosis (hereditary haemochromatosis, bronze diabetes, iron-storage disease)** *n.* a hereditary disorder in which there is excessive absorption and storage of iron. This leads to damage and functional impairment of many organs, including the liver, pancreas, and endocrine glands. The main features are a bronze colour of the skin, diabetes, and liver failure. It is inherited as an autosomal **\*recessive** trait in people of northern European descent and is due to mutations in the haemochromatosis gene (*HFE*) in the majority of cases. Iron may be removed from the body by blood letting or an iron **\*chelating agent** may be administered. *Compare* **HAEMOSIDEROSIS**.

**haemoconcentration** *n.* an increase in the proportion of red blood cells relative to the plasma, brought about by a decrease in the volume of plasma or an increase in the concentration of red blood cells in the circulating blood (see **POLYCYTHAEMIA**). Haemoconcentration may occur in any condition in which there is a severe loss of water from the body. *Compare* **HAEMODILUTION**.

**haemocytometer** *n.* a special glass chamber of known volume into which diluted blood is introduced. The numbers of the various blood cells present are then counted visually, through a microscope. Haemocytometers have been largely replaced by electronic cell counters.

**haemodiafiltration** *n.* a form of renal replacement therapy that removes toxins by a combination of diffusion (as in conventional **\*haemodialysis**) and convection (as in **\*haemofiltration**), and is more efficient than either in the process.

**haemodialysis** *n.* a technique of removing waste materials or poisons from the blood using the principle of **\*dialysis**. Haemodialysis is performed on patients whose kidneys have ceased to function; the process takes place in a **\*dialyser**. The stream of blood taken from an artery is circulated through the dialyser on one side of a semipermeable membrane, while a solution of similar electrolytic composition to the patient's blood circulates on the other side. Water and waste products from the patient's blood filter through the membrane, whose pores are too small to allow passage of blood cells and proteins. The purified blood is then returned to the patient's body through a vein.

**haemodilution** *n.* a decrease in the proportion of red blood cells relative to the plasma, brought about by an increase in the total volume of plasma. This may occur in a variety of conditions, including pregnancy and enlargement of the spleen (see **HYPERSPLENISM**). *Compare* **HAEMOCONCENTRATION**.

**haemofiltration** *n.* the use of a transmembrane hydrostatic pressure to induce filtration of plasma water across the membrane of a **haemofilter**. Solutes dissolved in the plasma water accompany their solvent to a greater or lesser extent dependent on molecular weight and the characteristics of the filter membrane (pore size).

**haemoglobin** *n.* a substance contained within the red blood cells (**\*erythrocytes**) and responsible for their colour, composed of the pigment **haem** (an iron-containing **\*porphyrin**) linked to the protein **globin**. Haemoglobin has the unique property of combining reversibly with oxygen and is the medium by which oxygen is transported within the body. It takes up oxygen as blood passes through the lungs and releases it as blood passes through the tissues. Blood normally contains 115 to 180 g/l of haemoglobin. *See also* **MYOGLOBIN**; **OXYHAEMOGLOBIN**.

**haemoglobin A<sub>1c</sub>** *see* **GLYCATED HAEMOGLOBIN**.

**haemoglobinometer** *n.* an instrument for determining the concentration of **\*haemoglobin** in a sample of blood, which is a measure of its ability to carry oxygen.

**haemoglobinopathy** *n.* any of a group of inherited diseases, such as **\*thalassaemia** and **\*sickle-cell disease**, in which there is an abnormality in the production of haemoglobin.

**haemoglobinuria** *n.* the presence in the urine of free haemoglobin. The condition occurs if haemoglobin, released from disintegrating red blood cells, cannot be taken up rapidly enough by blood proteins. The condition sometimes follows strenuous exercise. It is also associated with certain infectious diseases (such as blackwater fever), ingestion of certain chemicals (such as arsenic), and injury.

**haemogram** *n.* the results of a routine blood test, including an estimate of the blood haemoglobin level, the **\*packed cell volume**, and the numbers of red and white blood cells (*see* **BLOOD COUNT**). Any abnormalities seen in microscopic examination of the blood are also noted.

**haemolysin** *n.* a substance capable of bringing about destruction of red blood cells (**\*haemolysis**). It may be an antibody or a bacterial toxin.

**haemolysis** *n.* the destruction of red blood cells (**\*erythrocytes**). Within the body, haemolysis may result from defects within the red cells or from poisoning, infection, or the action of antibodies; it may occur in mismatched blood transfusions. It usually leads to anaemia. Haemolysis of blood

specimens may result from unsatisfactory collection or storage or be brought about intentionally as part of an analytical procedure (*see* [LAKING](#)).

**haemolytic** *adj.* causing, associated with, or resulting from destruction of red blood cells (*\*erythrocytes*). For example, a **haemolytic antibody** is one that causes destruction of red cells; a **haemolytic anaemia** is due to red-cell destruction (*see* [ANAEMIA](#)).

**haemolytic disease of the newborn** the condition resulting from destruction (haemolysis) of the red blood cells of the fetus by antibodies in the mother's blood passing through the placenta. When an exchange occurs between fetal and maternal blood (as at delivery, placental abruption, threatened miscarriage, or invasive procedures), the passage of red cells into the maternal circulation provokes an antibody response to the fetal red blood cell antigen in the mother. This most commonly happens when the red blood cells of the fetus are Rh positive (i.e. they have the *\*rhesus factor*) but the mother's red cells are Rh negative. For the rhesus antigen, the primary IgM antibodies (*see* [IMMUNOGLOBULIN](#)) do not cross the placenta, but if the mother is exposed in another pregnancy, IgG antibodies do cross the placenta. This may result in very severe anaemia of the fetus, leading to heart failure with oedema (*\*hydrops fetalis*) or stillbirth. When the anaemia is less severe the fetus may reach term in good condition, but the accumulation of the bile pigment bilirubin from the destroyed cells causes severe jaundice after birth, which may require *\*exchange transfusion*. If untreated, it may cause serious brain damage (*see* [KERNICTERUS](#)). Other red cell antibodies that are clearly associated with fetal anaemia are D, Kell, and c.

A blood test early in pregnancy enables the detection of antibodies in the mother's blood and the adoption of various precautions for the infant's safety, including Doppler measurement of the fetal cerebral vessels (MCA Doppler; *see* [DOPPLER ULTRASOUND](#)) to detect fetal anaemia, which may require intrauterine transfusion. The incidence of the disease has been greatly reduced by preventing the formation of antibodies in a Rh-negative mother (*see* [ANTI-D IMMUNOGLOBULIN](#)).

**haemolytic uraemic syndrome** a condition in which sudden rapid destruction of red blood cells (*see* [HAEMOLYSIS](#)) causes acute renal failure due partly to obstruction of small arteries in the kidneys. The haemolysis also

causes a reduction in the number of platelets, which can lead to severe haemorrhage. The syndrome may occur as a result of septicaemia following a respiratory or gastrointestinal infection (especially by pathogenic *\*Escherichia coli*), eclamptic fits in pregnancy (see [ECLAMPSIA](#)), or as a reaction to certain drugs. There may also be small sporadic outbreaks of the condition without any obvious cause.

**haemoperfusion** *n.* the passage of blood through a sorbent column with the aim of removing toxic substances. The commonest sorbent in use is charcoal, microencapsulated with cellulose nitrate. Haemoperfusion might be considered for the treatment of poisoning with carbamazepine, theophylline, barbiturates, and *Amanita* mushrooms.

**haemopericardium** *n.* the presence of blood within the membranous sac (pericardium) surrounding the heart, which may result from injury, tumours, rupture of the heart (e.g. following myocardial infarction), or a leaking aneurysm. The heart is compressed (see [CARDIAC TAMPONADE](#)) and the circulation impaired; a large fall in blood pressure and cardiac arrest may result. Surgical drainage of the blood may be life saving.

**haemoperitoneum** *n.* the presence of blood in the peritoneal cavity, between the lining of the abdomen or pelvis and the membrane covering the organs within.

**haemophilia** *n.* either of two hereditary disorders in which the blood clots very slowly, due to a deficiency of either of two *\*coagulation factors*: **haemophilia A**, due to deficiency of Factor VIII (antihæmophilic factor); or **haemophilia B**, due to deficiency of Factor IX (Christmas factor). The patient may experience prolonged bleeding following any injury or wound, and in severe cases there is spontaneous bleeding into muscles and joints. Bleeding in haemophilia may be treated by recombinant-DNA-derived Factor VIII or plasma Factor VIII concentrate. Alternatively concentrated preparations of Factor VIII or Factor IX, obtained by freezing fresh plasma, may be administered (see [CRYOPRECIPITATE](#)). Haemophilia is controlled by a *\*sex-linked* gene, which means that it is almost exclusively restricted to males: women can carry the gene – and pass it on to their sons – without being affected themselves. The genes encoding factors VIII and IX have been used in gene therapy trials for haemophilia. —**haemophiliac** *n.*

<https://haemophilia.org.uk/>

- Website of the Haemophilia Society

**Haemophilus** *n.* a genus of Gram-negative aerobic nonmotile parasitic rodlike bacteria frequently found in the respiratory tract. They can grow only in the presence of certain factors in the blood and/or certain coenzymes: they are cultured on fresh blood **\*agar**. Most species are pathogenic: *H. aegyptius* causes conjunctivitis, and *H. ducreyi* soft sore (chancroid). *H. influenzae* is associated with acute and chronic respiratory infections (*see also* **EPIGLOTTITIS**) and is a common secondary cause of **\*influenza** infections; *H. influenzae* type b is an important cause of bacterial **\*meningitis** in young children (*see* **HIB VACCINE**).

**haemophthalmia** *n.* bleeding into the **\*vitreous humour** of the eye: vitreous haemorrhage.

**haemopneumothorax** *n.* the presence of both blood and air in the pleural cavity, usually as a result of injury. Both must be drained out to allow the lung to expand normally. *See also* **HAEMOTHORAX**.

**haemopoiesis (haematopoiesis)** *n.* the process of production of blood cells and platelets which continues throughout life, replacing aged cells (which are removed from the circulation). In healthy adults, haemopoiesis is confined to the **\*bone marrow**, but in embryonic life and in early infancy, as well as in certain diseases, it may occur in other sites (**extramedullary haemopoiesis**).

*See also* **ERYTHROPOIESIS**; **LEUCOPOIESIS**; **THROMBOPOIESIS**. —

**haemopoietic** *adj.*

**haemopoietic stem cell** the cell from which all classes of blood cells are derived. It cannot be identified microscopically, but can be defined by the presence of a combination of cell-surface proteins. It can be demonstrated by **\*tissue culture** of the blood-forming tissue of the bone marrow, as well as by growth of human haemopoietic cells in immunodeficient mice strains, such as non-obese diabetic/severe combined immunodeficient (NOD/SCID). *See also* **HAEMOPOIESIS**.

**haemoptysis** *n.* the coughing up of blood. This symptom should always be taken seriously, however small the amount. In some patients the cause is not serious; in others it is never found. But it should always be reported to a doctor.

**haemorrhage (bleeding)** *n.* the escape of blood from a ruptured blood vessel, externally or internally. Arterial blood is bright red and emerges in spurts, venous blood is dark red and flows steadily, while damage to minor vessels may produce only an oozing. Rupture of a major blood vessel such as the femoral artery can lead to the loss of several litres of blood in a few minutes, resulting in **\*shock**, collapse, and death, if untreated. *See also* HAEMATEMESIS; HAEMATURIA; HAEMOPTYSIS.

**haemorrhagic** *adj.* associated with or resulting from blood loss (*see* HAEMORRHAGE). For example, **haemorrhagic anaemia** is due to blood loss (*see* ANAEMIA).

**haemorrhagic disease of the newborn** a temporary disturbance in blood clotting caused by **\*vitamin K** deficiency and affecting infants on the second to fourth day of life. It varies in severity from mild gastrointestinal bleeding to profuse bleeding into many organs, including the brain. It is more common in breast-fed and preterm infants. The condition can be prevented by giving all babies vitamin K, either by injection or orally, shortly after birth. Medical name: **melaena neonatorum**.

**haemorrhoidectomy** *n.* the surgical operation for removing **\*haemorrhoids**, which are tied and then excised. Possible complications are bleeding or, later, anal stricture (narrowing). The operation is usually performed only for second- or third-degree haemorrhoids that have not responded to simple measures.

**haemorrhoids (piles)** *pl. n.* enlargement of the normal spongy blood-filled cushions in the wall of the anus (**internal haemorrhoids**), usually a consequence of prolonged constipation or, less often, diarrhoea. They most commonly occur at three main points equidistant around the circumference of the anus. Uncomplicated haemorrhoids are seldom painful; any pain is usually caused by an anal **\*fissure**. The main symptom is bleeding, and in **first-degree haemorrhoids**, which never appear at the anus, bleeding at the end of defaecation is the only symptom. **Second-degree haemorrhoids**

protrude beyond the anus as an uncomfortable swelling but return spontaneously; **third-degree haemorrhoids** remain outside the anus and need to be returned by manipulation.

First- and second-degree haemorrhoids may respond to bowel regulation using a high-fibre diet and faecal softening agents. If bleeding persists, elastic bands may be applied or a sclerosing agent may be injected around the swollen cushions to eradicate them. Third-degree haemorrhoids often require surgery (*see* **HAEMORRHOIDECTOMY**), especially if they become **\*strangulated** (producing severe pain and further enlargement).

**External haemorrhoids** are either prolapsed internal haemorrhoids or – more often – **\*perianal haematomas** or the residual skin tags remaining after a perianal haematoma has healed.

**haemosalpinx** *n.* *see* **HAEMATOSALPINX**.

**haemosiderin** *n.* an iron-storage compound found mainly in the cells of the **\*macrophage**– **\*monocyte** system in the marrow, in the **\*Kupffer cells** of the liver, and in the spleen. It contains around 30% iron by weight.

**haemosiderosis** *n.* the accumulation of **\*haemosiderin** in various tissues.

**haemostasis** *n.* the arrest of bleeding, involving the physiological processes of **\*blood coagulation** and the contraction of damaged blood vessels. The term is also applied to various surgical procedures (for example the application of **\*ligatures** or **\*diathermy** to cut vessels) used to stop bleeding.

**haemostatic (styptic)** *n.* an agent that stops or prevents haemorrhage; for example, **\*tranexamic acid** and **\*phytonadione**. Haemostatics are used to control bleeding due to various causes.

**haemothorax** *n.* blood in the pleural cavity, usually due to injury. If the blood is not drained dense fibrous **\*adhesions** occur between the pleural surfaces, which can impair the normal movement of the lung. The blood may also become infected (*see* **EMPYEMA**).

**haemozoin** *n.* an iron-containing pigment present in the organisms that cause malaria (**\*Plasmodium** species).

**hair** *n.* a threadlike keratinized outgrowth of the epidermis of the **\*skin**. It develops inside a tubular **hair follicle**. The part above the skin consists of

three layers: an outer **cuticle**; a **cortex**, forming the bulk of the hair and containing the pigment that gives the hair its colour; and a central core (**medulla**), which may be hollow. The **root** of the hair, beneath the surface of the skin, is expanded at its base to form the **bulb**, which contains a matrix of dividing cells. As new cells are formed the older ones are pushed upwards and become keratinized to form the root and shaft. A hair may be raised by a small erector muscle in the dermis, attached to the hair follicle.

**hairball** *n.* *see* **TRICHOBEZOAR**.

**hair follicle** a sheath of epidermal cells and connective tissue that surrounds the root of a *\*hair*.

**hair papilla** a projection of the dermis that is surrounded by the base of the hair bulb. It contains the capillaries that supply blood to the growing *\*hair*.

**hairy cell** an abnormal white blood cell that has the appearance of an immature lymphocyte with fine hairlike cytoplasmic projections around the perimeter of the cell. It is found in a rare form of leukaemia (**hairy-cell leukaemia**) most commonly occurring in young men.

**halfway house** a residential home for a group of people where some professional supervision is available. It is used as a stage in the rehabilitation of recovering drug addicts and people who are mentally ill, usually when they have just been discharged from hospital or a rehabilitation facility and are able to work but are not yet ready for independent life.

**halitosis** *n.* bad breath. Causes of temporary halitosis include recently eaten strongly flavoured food, such as garlic or onions, and drugs such as paraldehyde. Other causes include mouth breathing, *\*periodontal disease*, and infective conditions of the nose, throat, and lungs (especially *\*bronchiectasis*). Constipation, indigestion, acute appendicitis, uraemia, and some liver diseases may also cause the condition. *See also* **FETOR**.

**Hallpike test** *see* **DIX–HALLPIKE TEST**.

**hallucination** *n.* a false sensory perception of something that is not really there; the perception is subjectively convincing but lacks an external stimulus. Hallucinations may be visual, auditory, tactile, gustatory (of taste), or olfactory (of smell). They may be provoked by mental illness (such as

**\*schizophrenia** or severe anxiety disorders), **\*personality disorders**, or physical disorders affecting the brain (such as temporal lobe **\*epilepsy**, sepsis, acute organic syndrome, or stroke) or they may be caused by drugs, alcohol, or sensory deprivation. Hallucinations should be distinguished from dreams and from **\*illusions** (which are misinterpretations of real stimuli). A substantial minority of the population experiences hallucinations not caused by mental illness. Some hallucinations are not always pathological: **hypnagogic hallucinations** occur in the state between wakefulness and sleep, and the images are often very distinct; these hallucinations occur in 30–60% of patients with **\*narcolepsy**. **Hypnopompic hallucinations** occur in the state between sleep and full wakefulness; like hypnagogic hallucinations, the experiences may be very vivid.

**hallucinogen** *n.* a drug that produces hallucinations, e.g. **\*cannabis** and **\*lysergic acid diethylamide**. Hallucinogens were formerly used to treat certain types of mental illness. — **hallucinogenic** *adj.*

**hallux** *n.* (*pl.* **halluces**) the big toe.

**hallux rigidus** painful stiffness and enlargement of the metatarsophalangeal joint, at the base of the big toe, resulting from osteoarthritis. Unlike **\*hallux valgus**, men are more commonly affected than women. Conservative treatment is often successful, but in some cases surgery (e.g. **\*cheilectomy**, **\*arthrodesis**, or **\*arthroplasty**) is required.

**hallux valgus** the most common foot deformity, usually affecting women, in which the big toe is displaced towards the others (i.e. away from the midline); it is associated with a **\*bunion**. The second toe may become crowded by the big toe and a **\*hammer toe** deformity often results. Treatment includes modified footwear and surgery.

**hallux varus** displacement of the big toe away from the others (i.e. towards the middle).

**haloes** *pl. n.* coloured rings seen around lights by people with acute (angle-closure) glaucoma and sometimes by people with cataract.

**haloperidol** *n.* a **\*butyrophenone** antipsychotic drug used to relieve anxiety and tension in the treatment of schizophrenia and other psychiatric disorders

and also to treat tics and related movement disorders. Muscular incoordination and restlessness are common side-effects.

**halophilic** *adj.* requiring solutions of high salt concentration for healthy growth. Certain bacteria are halophilic. —**halophile** *n.*

**hamartoma** *n.* an overgrowth of mature tissue in which the elements show disordered arrangement and proportion in comparison to normal. The overgrowth is benign but malignancy may occur in any of the constituent tissue elements.

**hamate bone (unciform bone)** a hook-shaped bone of the wrist (*see* **CARPUS**). It articulates with the capitate and triquetral bones at the sides, with the lunate bone behind, and with the fourth and fifth metacarpal bones in front.

**Hamman's sign** a crunching sound synchronous with the heartbeat heard with a stethoscope in 45–50% of patients with **\*pneumomediastinum**. [L. V. Hamman (1877–1946), US physician]

**hammer** *n.* (in anatomy) *see* **MALLEUS**.

**hammer toe** a deformity of a toe, most often the second, caused by fixed flexion of the proximal interphalangeal joint, which produces extension of distal interphalangeal and metatarsophalangeal joints. A corn often forms over the deformity, which may be painful. If severe pain does not respond to strapping or corrective footwear, it may be necessary to perform **\*arthrodesis** at the affected joint.

**hamstring** *n.* any of the tendons at the back of the knee. They attach the **hamstring muscles** (the biceps femoris, semitendinosus, and semimembranosus) to their insertions in the tibia and fibula.

**hamulus** *n.* (*pl.* **hamuli**) any hooklike process, such as occurs on the hamate, lacrimal, and sphenoid bones and on the cochlea.

**HAN** heroin-associated nephropathy: a syndrome of massive proteinuria, hypoalbuminuria, and hyperlipidaemia, with or without oedema, seen after prolonged intravenous addiction to heroin. Renal biopsies show the changes of **\*focal segmental glomerulosclerosis** but the condition does not respond to immunosuppressant treatment and progresses to end-stage renal failure.

**hand** *n.* the terminal organ of the upper limb. From a surgical point of view, the human hand comprises the eight bones of the **\*carpus** (wrist), the five metacarpal bones, and the phalangeal bones plus the surrounding tissues; anatomically, the bones and tissues of the wrist are excluded. The hand is a common site of infections and injuries, many of which are of industrial origin for which compensation may be claimed.

**handedness** *n.* the preferential use of one hand, rather than the other, in voluntary actions. Ambidexterity – the ability to use either hand with equal skill – is very rare. Over 95% of right-handed people and 50–70% of left-handed people have left-hemisphere dominance for language.

**hand, foot, and mouth disease** a self-limiting disease, mainly affecting young children, caused by **\*Coxsackie virus** A16. A feeling of mild illness is accompanied by mouth ulcers and blisters on the hands and feet.

**hand–foot syndrome** *see* **PALMOPLANTAR ERYTHRODYSAESTHESIA**.

**handicap** *n.* the extent to which an individual is disadvantaged by some partial or total **\*disability** when compared with those in a peer group who have no such disability. The term has now fallen into disfavour as it is felt to have negative connotations

**Hand–Schüller–Christian disease** *see* **LANGERHANS CELL HISTIOCYTOSIS**. [A. Hand (1868–1949), US paediatrician; A. Schüller (1874–1958), Austrian neurologist; H. A. Christian (1876–1951), US physician]

**Hansen's bacillus** *see* **MYCOBACTERIUM**. [G. H. A. Hansen (1841–1912), Norwegian physician]

**Hansen's disease** *see* **LEPROSY**.

**hantavirus** *n.* one of a genus of viruses that infect rats, mice, and voles and cause disease in humans when the secretions or excreta of these rodents are inhaled or ingested. The disease was first reported from the area of the Hantaan river, which separates North from South Korea, but hantavirus infections also occur in Japan, China, Russia, Europe, and the USA: in Britain it can affect farm, nature conservancy, and sewage workers and those engaged in water sports. The symptoms vary according to the strain of the

infecting virus. Many patients have a mild influenza-like illness, but severe cases are characterized by high fever, headache, shock, nausea and vomiting, and *\*petechiae* in the skin; there may be kidney pain and rapidly progressive kidney damage leading to kidney failure. A particularly virulent strain in the USA attacks the lungs, leading to rapid respiratory failure. The mortality rate in these severe cases is high.

**haploid (monoploid)** *adj.* describing cells, nuclei, or organisms that have a single set of unpaired chromosomes. In humans the gametes are haploid following *\*meiosis*. Compare **DIPLOID**; **TRIPLOID**. —**haploid** *n.*

**haplotype** *n.* a complete set of *\*HLA* antigens inherited from either parent.

**happy puppet syndrome** *see* **ANGELMAN SYNDROME**.

**hapt- (hapto-)** *combining form denoting touch.*

**haptén** *n. see* **ANTIGEN**.

**haptoglobin** *n.* a protein present in blood plasma that binds with free haemoglobin to form a complex that is rapidly removed from the circulation by the liver. Depletion of plasma haptoglobin is a feature of anaemias in which red blood cells are destroyed inside the circulation with the release of haemoglobin into the plasma and its loss in the urine.

**harara** *n.* a severe and itchy inflammation of the skin occurring in people continuously subjected to the bites of the *\*sandfly* *Phlebotomus papatasi*. The incidence of this allergic skin reaction, prevalent in the Middle East, may be checked by controlling the numbers of sandflies.

**harelip** *n. see* **CLEFT LIP**.

**harlequin colour change** an unusual phenomenon in newborn babies characterized by transient red colour changes to half of the body, well demarcated at the midline. It is seen usually 2–5 days after birth and can last from 30 seconds to 20 minutes before fading away. It may recur when the infant is placed on his or her side as the intensity of the erythema appears to be gravity-dependent.

**harm** *n.* physical, mental, or moral damage or the threat of this. Avoiding it is one of the ethical *\*four principles* known as *\*nonmaleficence*. Although

health service staff have a clear duty to benefit patients and avoid harming them, in practice almost all medical actions run the risk of harming the patient and in some no good effect can be achieved without a clearly harmful process (such as mastectomy or chemotherapy for breast cancer). Therefore all medical professionals should learn how to make a *\*risk–benefit analysis* at each point of care. The risk of harm should be explained to patients and their agreement obtained at each appropriate point. Professional blame or litigation may result if this is not done and harm results. *See also* **PRIMUM NON NOCERE**; **PROFESSIONALISM**.

**Harrison's sulcus** a depression on both sides of the chest wall of a child between the pectoral muscles and the lower margin of the ribcage. It is caused by exaggerated suction of the diaphragm when breathing in and develops in conditions in which the airways are partially obstructed (e.g. poorly treated asthma) or when the lungs are abnormally congested due to some congenital abnormality of the heart. [E. Harrison (1789–1838), British physician]

**Hartmann's operation** a method of reconstruction after surgical removal of the distal colon and proximal rectum, in which the rectal stump is closed off and the divided end of the colon is brought out as a *\*colostomy*. The technique allows for a second operation to join up the bowel ends and obviates the need for a stoma. It is often used temporarily where primary anastomosis is unsafe (e.g. in cases of perforated *\*diverticular disease*) or permanently as a palliative procedure (e.g. for unresectable colonic cancer). [H. Hartmann (1860–1952), French surgeon]

**Hartmann's pouch** a saclike dilatation of the gall-bladder wall near its outlet; it is a common site for finding *\*gallstones*. [R. Hartmann (1831–93), German anatomist]

**Hartmann's solution** a *\*physiological solution* used for infusion into the circulation. In addition to essential ions, it also contains glucose. [A. F. Hartmann (1898–1964), US paediatrician]

**Hartnup disease** a rare hereditary defect in the absorption of the amino acid tryptophan, leading to learning disability, thickening and roughening of the skin on exposure to light, and lack of muscular coordination. The condition is

similar to *\*pellagra*. Treatment with nicotinamide is usually effective. [Hartnup, the family in whom it was first reported]

**harvest mite** *see* *TROMBICULA*.

**Hashimoto's disease (Hashimoto's thyroiditis)** chronic inflammation of the thyroid gland (**thyroiditis**) due to the formation of *\*thyroid antibodies*. Its features include a firm swelling of the thyroid and partial or total failure of secretion of thyroid hormones; often there are autoantibodies to other organs, such as the stomach. Women are more often affected than men and the condition often occurs in families. [H. Hashimoto (1881–1934), Japanese surgeon]

**hashish** *n. see* *CANNABIS*.

**Hasson technique** a technique used in laparoscopic surgery in which the skin, muscle, fascia, and peritoneum are incised under direct vision to allow the insertion of a blunt *\*trocar*, through which the laparoscope is introduced. [H. M. Hasson (21st century), US gynaecologist]

**haustrum** *n.* one of the pouches on the external surface of the *\*colon*.

**Haversian canal** one of the small canals (diameter about 50 µm) that ramify throughout compact *\*bone*. *See also* *HAVERSIAN SYSTEM*. [C. Havers (1650–1702), English anatomist]

**Haversian system** one of the cylindrical units of which compact *\*bone* is made. A **Haversian canal** forms a central tube, around which are alternate layers of bone matrix (**lamellae**) and **lacunae** containing bone cells. The lacunae are linked by minute channels (**canaliculi**).

**hay fever** a form of *\*allergy* due to the pollen of grasses, trees, and other plants, characterized by inflammation of the membrane lining the nose and sometimes of the conjunctiva (*see* *CONJUNCTIVITIS*). The symptoms of sneezing, running or blocked nose, and watering eyes are due to histamine release and often respond to treatment with *\*antihistamines*. If the allergen is identified, it may be possible to undertake *\*desensitization*. Medical name: **allergic rhinitis**.

**hazardous substance** (in occupational health) *see* *COSHH*.

**HbA<sub>1c</sub>** *see* GLYCATED HAEMOGLOBIN.

**hCG** *see* HUMAN CHORIONIC GONADOTROPHIN.

**HDL** *see* HIGH-DENSITY LIPOPROTEIN.

**HDU** *see* HIGH-DEPENDENCY UNIT.

**head** *n.* **1.** the part of the body that contains the brain and the organs of sight, hearing, smell, and taste. **2.** the rounded portion of a bone, which fits into a groove of another to form a joint;

for example, the head of the humerus or femur.

**headache** *n.* pain felt deep within the skull. Most headaches are caused by stress or fatigue but some are symptoms of serious intracranial disease. *See also* CLUSTER HEADACHE; MIGRAINE.

**head injury** an injury usually resulting from a blow to the head and often associated with *\*traumatic brain injury*. It may result in *\*contusion* or – if the blood vessels in the head are torn – a *\*haematoma*. The level of consciousness of a patient following a head injury can be monitored using the *\*Glasgow Coma Scale*. Head injuries are an important cause of death due to accidents: legislation to impose protective headgear at industrial sites and on construction workers and motorcyclists has reduced their incidence.

**head tilt, chin lift** a manoeuvre for opening the airway of an unconscious patient. With the patient lying on his or her back, the neck is extended and the chin simultaneously pulled gently upwards to pull the tongue away from the back of the pharynx. This method is often used when mouth-to-mouth ventilation is to be given and is an alternative to the *\*jaw thrust* manoeuvre.

**Heaf test** a skin test to determine whether or not an individual is immune to tuberculosis, carried out prior to vaccination. A spring-loaded gun mounted with very short needles produces a circle of six punctures in the forearm through which *\*tuberculin* is introduced. If the test is positive a reaction causes the skin to become red and raised, indicating that the individual is immune. If the test is negative a vaccine (*\*BCG*) should be given. [F. R. G. Heaf (20th century), British physician]

**healing** *n.* making whole, both by restoring injured or diseased tissue and, more generally, by returning to full and independent function. The latter may take a lot longer than the former: this is one of the reasons for follow-up after a medical event and for convalescence and rehabilitation services. *See also* **EMPOWERMENT**.

**health** *n.* according to the official definition of the World Health Organization, a state of complete physical, mental, and social wellbeing, not merely the absence of disease or infirmity. Others question whether defining it as an ideal state truly expresses either its practical dynamics or its philosophical complexity.

**health-adjusted life expectancy** a measure developed by the World Health Organization to capture life expectancy in terms of both morbidity and mortality. The number of years lived with ill-health, weighted according to severity, are subtracted from the overall life expectancy. Previously known as **disability-adjusted life expectancy**, it is sometimes referred to as **healthy life expectancy**. *See also* **DISABILITY-ADJUSTED LIFE YEAR**.

**Health and Safety Executive (HSE)** (in Britain) a statutory body responsible for health and safety in the workplace (including factories, offices, and farms). *See also* **COSHH**.

<http://www.hse.gov.uk/>

- HSE website: provides guidance on a wide range of health and safety topics

**Health and Social Care Information Centre (HSCIC)** formerly, an executive nondepartmental public body set up in April 2013 to collect, analyse, and publish UK national health data and supply IT systems and services to health-care providers nationwide. It was rebranded as **\*NHS Digital** in August 2016.

**health and wellbeing board (HWB)** a statutory local authority committee that aims to improve integration between local health care, social care, and other public service providers. HWBs (of which there are over 130) also have a responsibility to reduce health inequalities and produce a local joint

strategic needs assessment to inform commissioning of local services. Each upper-tier local authority is obliged under the Health and Social Care Act 2012 to have an HWB, whose membership must include: an elected local representative; the local [\\*Directors of Public Health](#), adult social services, and children's social services; and representatives from the local [\\*Healthwatch](#), each local [\\*clinical commissioning group](#), and [\\*NHS England](#).

**health authority** *see* [NATIONAL HEALTH SERVICE](#).

**health board** a health authority in Wales (since 2003), Scotland, and Northern Ireland. *See* [NATIONAL HEALTH SERVICE](#).

**health care** *see* [PRIMARY CARE](#); [SECONDARY CARE](#); [TERTIARY CARE](#).

**health-care commissioning** identifying services required to meet population health-care needs and obtaining such services from an appropriate service provider via allocation of resources and contracting arrangements. Commissioners monitor the quality of commissioned services, including adherence to any appropriate national standards. Most NHS commissioning is undertaken by [\\*clinical commissioning groups](#) or [\\*NHS England](#).

**health centre** (in Britain) a building, usually owned or leased by a health authority, that houses personnel and/or services from one or more sections of the [\\*National Health Service](#) (e.g. [\\*general practitioners](#), [\\*district nurses](#), dentists, and [\\*child health clinics](#)). Services provided by local authorities, such as social services, may also operate from such a centre. A **GP-led health centre (polyclinic)** is one where a greater range of health services are available compared to conventional GP practices. They offer extended opening hours and other health services, such as ophthalmology and dentistry, as well as diagnostics, outpatient appointments, urgent care, and community services, such as community mental health care, community nursing, and management of long-term conditions. The main aim is to move more services into the community, thus making them easier to access for patients. Various models have been proposed for polyclinics, ranging from large premises housing many separate GP practices to more extensive facilities with additional services available. *See also* [CHILDREN'S CENTRE](#).

**health education** methods used to inform people (either individually or collectively) and persuade and enable them to adopt lifestyles that the educators believe will improve health and to reject habits regarded as harmful to health. The term is also used in a broader sense to include instruction about bodily function, etc., so that the public is better informed about health issues. All children receive health education at school, often as part of a **personal, social, and health education (PSHE)** programme. *See also* **HEALTH PROMOTION**.

**Health Education England (HEE)** a *\*special health authority* of the NHS responsible for leading education and training for the whole health-care and public health workforce. It was established following the Health and Social Care Act 2012. *See also* **LOCAL EDUCATION AND TRAINING BOARDS**.

<http://www.hee.nhs.uk/>

- HEE website

**health impact assessment (HIA)** a systematic process that generally uses existing scientific literature and local geographic and demographic knowledge to judge the potential impact of a project or policy on the health of a population. HIAs are used to assess the likely health impact of many different types of projects or policies, from large construction projects to taxation policies.

**health inequalities** differences in health-related *\*variables* (e.g. life expectancy, all-age all-cause mortality, breast cancer incidence) between population groups (often defined by socio-economic group, sex, age, ethnic group, place of birth, place of residence, and income). Health inequalities between groups arise as a result of differences in constitutional factors (e.g. age, sex, ethnic group), educational attainment, health-related behaviour (e.g. smoking, diet) and access to services. Typically, socio-economic deprivation is associated with poorer health outcomes. Recent government policy has sought to reduce gaps in health outcomes between population groups, particularly those related to socio-economic group and income.

**health maintenance organization (HMO)** in the USA, a type of prepaid group medical practice with a defined and restricted patient population. Each

enrolled patient pays a fixed fee regardless of the amount of physician services used. The HMO physicians assume responsibility for the health care of the enrolled members and provide a wide range of inpatient and outpatient services.

**health needs assessment (HNA)** a systematic process that assesses the health needs of a given population, often with relation to a particular issue (e.g. smoking or alcohol consumption). It aims to lead to policy that allows health resources to be used in the most efficient way.

**health promotion** action to maintain the best possible health and quality of life of the members of the community and to stimulate their involvement in their personal health, both collectively and individually. Programmes may include interventions targeting individuals and their behaviour, such as **\*health education**, immunization, and **\*screening tests**, and interventions targeting populations, such as environmental monitoring, housing, and water and food supplies.

**health protection** the branch of **\*public health medicine** that is concerned with protecting the population from communicable diseases, chemicals and poisons, radiation, and other potential threats to health. *See* **PUBLIC HEALTH ENGLAND**.

**Health Protection Agency (HPA)** formerly, a nondepartmental public body set up as a special health authority in 2003 to protect the health of the UK population via advice and support to the NHS, local authorities, the Department of Health, emergency services, and others. The HPA was abolished in April 2013; its responsibilities were largely passed to **\*Public Health England**. *See* **CONSULTANT IN HEALTH PROTECTION**.

**Health Research Authority** a **\*special health authority** of the NHS established following the Health and Social Care Act 2012 to promote and protect the interests of patients in health research and to simplify the regulation of research. The Health Research Authority inherited the functions of the National Research Ethics Service, which closed in 2012.

<https://www.hra.nhs.uk/>

- Website of the Health Research Authority

**health service manager** an administrator with special training and skills in management who is concerned with the planning and provision of health services and with managing performance. Some managers enter the profession via the NHS Graduate Management Training Scheme; for others the basic training is in disciplines other than health; however, doctors, nurses, and others may fill such posts, sometimes combining them with professional appointments. *See also* [NATIONAL HEALTH SERVICE](#).

**health service planning** balancing the health and health-care needs of a community, assessed by such indices as mortality, morbidity, and disability, with the resources available to meet these needs in terms of human resources (including ensuring the numbers in training grades meet future requirements) and technical resources, such as hospitals (capital planning), equipment, and medicines. *See also* [CLINICAL AUDIT](#).

**health visitor** a trained nurse with specialist qualifications in [\\*health promotion](#) and public health. The role of the health visitor takes place within the primary health-care team and focuses on families with children under five years old, but can be extended to other targeted groups in the population (e.g. the elderly) to meet health needs in the wider community. Health visitors seek to educate, in particular by drawing attention to unmet needs in terms of health and social care.

**Healthwatch England** the national consumer champion for health and social care, formed following the Health and Social Care Act 2012. In addition, there are 148 **local Healthwatch** groups, which have statutory representation on local [\\*health and wellbeing boards](#).

<https://www.healthwatch.co.uk/>

- Healthwatch England website

**hearing aid** a device to improve the hearing. Simple passive devices, such as ear trumpets, are now rarely used. An **analogue hearing aid** consists of a miniature microphone, an amplifier, and a tiny loudspeaker. The aid is powered by a battery and the whole unit is small enough to fit behind or

within the ear inconspicuously. If necessary, aids can be built into the frames of spectacles. In a few cases of conductive hearing loss the loudspeaker is replaced by a vibrator that presses on the bone behind the ear and transmits the sound energy through the bones of the skull to the inner ear. **Digital hearing aids** are in some respects similar to analogue aids but in addition to the microphone, amplifier, and loudspeaker, they have digital-to-analogue converters and a tiny computer built into the casing of the aid. This enables the aid to be programmed to the patient's particular requirements and generally offers improved sound quality. *See also* [BONE-ANCHORED HEARING AID](#); [COCHLEAR IMPLANT](#); [ENVIRONMENTAL HEARING AID](#); [IMPLANTABLE HEARING AID](#).

**hearing loss** *see* [DEAFNESS](#).

**hearing therapy** the support and rehabilitation of people with hearing difficulties, tinnitus, or vertigo. It includes supplying help with acclimatizing to [\\*hearing aids](#), teaching lip-reading, advising on [\\*environmental hearing aids](#), and offering general information and advice regarding the auditory system. Other functions are to explain such conditions as [\\*Ménière's disease](#) and [\\*otosclerosis](#) and to provide [\\*tinnitus retraining therapy](#) (TRT) and other forms of tinnitus management.

**heart** *n.* a hollow muscular cone-shaped organ, lying between the lungs, with the pointed end (**apex**) directed downwards, forwards, and to the left. The heart is about the size of a closed fist. Its wall consists largely of [\\*cardiac muscle](#) (myocardium), lined and surrounded by membranes (*see* [ENDOCARDIUM](#); [PERICARDIUM](#)). It is divided by a **septum** into separate right and left halves, each of which is divided into an upper [\\*atrium](#) and a lower [\\*ventricle](#) (*see* illustration). Deoxygenated blood from the [\\*venae cavae](#) passes through the right atrium to the right ventricle. This contracts and pumps blood to the lungs via the [\\*pulmonary artery](#). The newly oxygenated blood returns to the left atrium via the pulmonary veins and passes through to the left ventricle. This forcefully contracts, pumping blood out to the body via the [\\*aorta](#). The direction of blood flow within the heart is controlled by [\\*valves](#).

**The heart (vertical section).**

<https://www.bhf.org.uk/>

- Website of British Heart Foundation: provides information on the operation of the heart, keeping the heart healthy, and the main types of heart condition

**heart age** a scoring system that uses biometric data to calculate the risk of a heart attack for an individual and expresses this risk in terms of notional heart age.

**heart attack** *see* MYOCARDIAL INFARCTION.

**heart block** a condition in which conduction of the electrical impulses generated by the natural pacemaker of the heart (the **\*sinoatrial node**) is impaired. In **partial** or **incomplete heart block** conduction between atria and ventricles is delayed (**first degree heart block**) or not all the impulses are conducted from the atria to the ventricles (**second degree heart block**). In **third degree** or **complete heart block** no impulses are conducted and the ventricles beat at their own slow intrinsic rate (20–40 per minute).

Heart block may be congenital or it may be due to heart disease, including myocardial infarction, myocarditis, cardiomyopathy, and disease of the valves. It is most frequently seen in the elderly as the result of chronic degenerative scarring around the conducting tissue. There may be no symptoms, but when very slow heart and pulse rates occur the patient may develop heart failure or syncope (*see* [STOKES-ADAMS SYNDROME](#)). Symptoms may be abolished by the use of an artificial [\\*pacemaker](#).

**heartburn (pyrosis)** *n.* discomfort or pain, usually burning in character, that is felt behind the breastbone and often appears to rise up from the abdomen towards or into the throat. It is usually caused by the reflux of stomach contents into the gullet and may be accompanied by the regurgitation of saliva or gastric fluid into the mouth (waterbrash).

**heart failure** a condition in which the pumping action of the heart is inadequate due to damaged heart valves, ventricular muscle, or both. This results in back pressure of blood, with congestion of organs. In **left ventricular** (or **left heart**) **failure**, congestion and fluid accumulation affect the lungs, resulting in pulmonary [\\*oedema](#). The patient suffers breathlessness, cough, and [\\*orthopnoea](#). There is reduced flow of arterial blood from the heart, which in extreme cases results in peripheral circulatory failure (**cardiogenic shock**). In **right ventricular** (or **right heart**) **failure**, the veins in the neck become engorged and fluid accumulates in the legs (peripheral oedema) or abdominal cavity ([\\*ascites](#)). If both left and right sides of the heart are affected then a combination of the above features is seen. This is usually referred to as **congestive cardiac failure (CCF)**.

Diuretics (e.g. furosemide) improve symptoms. [\\*ACE inhibitors](#), [\\*beta blockers](#), and [\\*spironolactone](#) improve symptoms and life expectancy in patients with left ventricular failure. Heart surgery may be required for the correction of valve problems.

**heart-lung machine** an apparatus for taking over temporarily the functions of both the heart and the lungs during heart surgery. It incorporates a pump, to maintain the circulation, and equipment to oxygenate the blood. Blood is taken from the body by tubes inserted into the superior and inferior venae cavae, and the oxygenated blood is returned under pressure into a large artery, such as the femoral artery. The surgeon is therefore able to undertake

the repair or replacement of heart valves or perform other surgical operations involving the heart and great blood vessels.

**heart rate** *see* **PULSE**.

**heater-probe** *n.* a device that can be passed through an endoscope to apply controlled heat in order to coagulate a bleeding peptic ulcer.

**heat exhaustion** fatigue and collapse due to the low blood pressure and blood volume that result from loss of body fluids and salts after prolonged or unaccustomed exposure to heat. It is most common in new arrivals in a hot climate and is treated by giving drinks or intravenous injections of salted water.

**heatstroke (sunstroke)** *n.* raised body temperature (pyrexia), absence of sweating, and eventual loss of consciousness due to failure or exhaustion of the temperature-regulating mechanism of the body. It is potentially fatal unless treated immediately: the body should be cooled by applying damp cloths and body fluids restored by giving drinks or intravenous injections of salted water.

**heavy-chain disease** a disorder associated with proliferation of B lymphocytes producing heavy chains – one of the two types of polypeptide chains (the other being light chains) that make up the structure of immunoglobulins. It results in the production of abnormal immunoglobulins with distorted heavy chains and no light chains.

**hebephrenia (disorganized schizophrenia)** *n.* an often chronic form of **\*schizophrenia** that typically starts in adolescence or young adulthood. The most prominent features are disordered thinking, inappropriate affect, flattening or shallowness of affect, naivety and vulnerability, thoughtless cheerfulness, apathy, and aimless or disjointed behaviour. Social and occupational rehabilitation are the most important therapies for most patients; **\*antipsychotic** drugs are also efficacious. — **hebephrenic** *adj.*

**Heberden's node** a bony thickening arising at the terminal joint of a finger in **\*osteoarthritis**. It is often inherited, with women most commonly affected. [W. Heberden (1710–1801), British physician]

**hectic** *adj.* occurring regularly. A **hectic fever** is a fever that typically develops in the afternoons, in cases of pulmonary tuberculosis.

**hecto-** *prefix denoting* a hundred.

**HEE** *see* **HEALTH EDUCATION ENGLAND**.

**heel** *n.* the part of the foot that extends behind the ankle joint, formed by the **heel bone** (*see* **CALCANEUS**).

**heel-prick blood test** *see* **GUTHRIE TEST**.

**Heerfordt's syndrome** a rare syndrome in which **\*sarcoidosis** is associated with swelling of the parotid and other salivary glands, uveitis, fever, and paralysis of the facial nerve. It can be treated with steroids but generally resolves spontaneously.

**HEFNEF** heart failure with normal ejection fraction: *see* **DIASTOLIC DYSFUNCTION**.

**Hegar's sign** an indication of pregnancy detectable between the 6th and 12th weeks: used before modern urine tests for pregnancy were available. If the fingers of one hand are inserted into the vagina and those of the other are placed over the pelvic cavity, the lower part of the uterus feels very soft compared with the body of the uterus above and the cervix below. [A. Hegar (1830–1914), German gynaecologist]

**Heimlich manoeuvre** *see* **ABDOMINAL THRUSTS**. [H. J. Heimlich (1920–2016), US physician]

**helc- (helco-)** *combining form denoting* an ulcer.

**Helicobacter** *n.* a genus of spiral flagellated Gram-negative bacteria. The species *H. pylori* (formerly classified as *Campylobacter pylori*) is found in the stomach within the mucous layer. It occurs in the majority of middle-aged people and may cause gastritis. It is almost invariably present in duodenal ulceration and usually in gastric ulceration. Testing to confirm infection includes the urea breath test. Eradication of the organism (using various combinations of antibiotics and **\*antisecretory drugs**) promotes ulcer healing. *H. pylori* has been implicated in some forms of stomach cancer and in

coronary heart disease. The role of other *Helicobacter* species in the causation of disease in humans is unclear.

**helicopter-based emergency medical services** *see* [HEMS](#).

**helicotrema** *n.* the narrow opening between the scala vestibuli and the scala tympani at the tip of the [\\*cochlea](#) in the ear.

**helio-** *combining form denoting* the sun.

**heliotherapy** *n.* the use of sunlight to promote healing; sunbathing.

**heliotrope rash** an eruption of violet-coloured macules with variable scale and oedema that predominantly affects the eyelids but may be more widespread. It is usually asymptomatic and is a cutaneous sign of [\\*dermatomyositis](#).

**helix** *n.* the outer curved fleshy ridge of the [\\*pinna](#) of the outer ear.

**Heller's operation** *see* [ACHALASIA](#). [E. Heller (1877–1964), Austrian pathologist]

**Heller's test** a test for the presence of protein (albumin) in the urine. A quantity of urine is carefully poured onto the same quantity of pure nitric acid in a test tube. A white ring forms at the junction of the liquids if albumin is present. However, a similar result may be obtained if the urine contains certain drugs or is very concentrated. A dark brown ring indicates the presence of an abnormally high level of potassium indoxyl sulphate in the urine (*see* [INDICANURIA](#)). [J. F. Heller (1813–71), Austrian pathologist]

**HELLP syndrome** a form of severe [\\*pre-eclampsia](#) affecting many body systems and characterized by *haemolysis*, *elevated liver enzymes*, and a *low platelet count* (hence the name). It constitutes an emergency requiring delivery as soon as the patient is stabilized.

**Helly's fluid** a mixture of potassium dichromate, sodium sulphate, mercuric chloride, formaldehyde, and distilled water, used in the preservation of bone marrow. [K. Helly (20th century), Swiss pathologist]

**helminth** *n.* any of the various parasitic worms, including the [\\*flukes](#), [\\*tapeworms](#), and [\\*nematodes](#).

**helminthiasis** *n.* the diseased condition resulting from an infestation with parasitic worms (helminths).

**helminthology** *n.* the study of parasitic worms.

**helper T cell** a type of T **\*lymphocyte** that plays a key role in cell-mediated immunity by recognizing foreign antigen on the surface of **\*antigen-presenting cells** when this is associated with the individual's **\*MHC** antigens, having been processed by antigen-presenting cells. Helper T cells stimulate the production of **\*cytotoxic T cells**, which destroy the target cells.

**hemeralopia** *n.* *see* **DAY BLINDNESS**.

**hemi-** *prefix denoting* (in medicine) the right or left half of the body. Example: **hemianaesthesia** (anaesthesia of one side of the body).

**hemiachromatopsia** *n.* loss of colour appreciation in one half of the visual field.

**hemianopia** *n.* absence of half of the normal field of vision. The commonest type is **homonymous hemianopia**, in which the same half (right or left) is lost in both eyes. Sometimes the inner halves of the visual field are lost in both eyes, producing a **binasal hemianopia**, while in others the outer halves are lost, producing a **bitemporal hemianopia**. Very rarely both upper halves or both lower halves are lost, producing an **altitudinal hemianopia**.

**hemiarthroplasty** *n.* *see* **ARTHROPLASTY**.

**hemiballismus** *n.* *see* **BALLISM**.

**hemicolectomy** *n.* surgical removal of sections of the large bowel (**\*colon**), either the ascending colon (**right hemicolectomy**) or the descending colon (**left hemicolectomy**). An **extended hemicolectomy** involves the additional excision of a section of the transverse colon. Such operations are performed in cases of inflammation (e.g. **\*Crohn's disease**) or cancer. The cut ends of the remaining bowel are joined together in a primary **\*anastomosis**.

**hemicrania** *n.* **1.** a headache affecting only one side of the head, usually **\*migraine**. **2.** absence of half of the skull in a developing fetus.

**hemifacial spasm** a type of *\*dystonia* that results in irregular spasms affecting the facial muscles on one side. It is usually due to irritation of the facial nerve by an overlying artery within the skull base. Treatment is with injections of *\*botulinum toxin*.

**hemihypertrophy** *n.* a condition in which one side of the body is larger than the other. It is often benign but can be associated with *\*nephroblastoma*.

**hemimelia** *n.* congenital absence or gross shortening (aplasia) of the distal portion of the arms or legs. Sometimes only one of the two bones of the distal arm (radius and ulna) or leg (tibia and fibula) may be affected. *See also* ECTROMELIA.

**hemiparesis** *n.* *see* HEMIPLEGIA.

**hemiplegia (hemiparesis)** *n.* paralysis of one side of the body. It is caused by disease affecting the opposite (contralateral) hemisphere of the brain.

**hemisacralization** *n.* fusion of the fifth lumbar vertebra to one side only of the sacrum. *See* SACRALIZATION.

**hemispatial neglect (neglect syndrome)** a deficit in attention to and awareness of one side of space. It is characterized by inability to process and perceive stimuli on one side of the body or environment that is not due to a lack of sensation. It is generally seen after damage to the right hemisphere, which leads to neglect of the contralateral (left) side of space.

**hemisphere** *n.* one of the two halves of the *\*cerebrum*, not in fact hemispherical but more nearly quarter-spherical.

**hemizygous** *adj.* describing genes that are carried on an unpaired chromosome, for example the genes on the X chromosome in males. — **hemizygote** *n.*

**hemlock** *n.* the plant *Conium maculatum*, found in Britain and central Europe. It is a source of the poisonous alkaloid *\*coniine*.

**hemp** *n.* *see* CANNABIS.

**HEMS** helicopter-based emergency medical services: a fast method for the provision of first aid and the rapid transport of the seriously injured (primary

use) or the critically ill (secondary use) to a hospital.

**Henle's loop** the part of a kidney tubule that forms a loop extending towards the centre of the kidney. It is surrounded by blood capillaries, which absorb water and selected soluble substances back into the bloodstream. [F. G. J. Henle (1809–85), German anatomist]

**Henoch–Schönlein purpura (Schönlein–Henoch purpura, anaphylactoid purpura)** a common, and frequently recurrent, form of **\*purpura** found especially (but not exclusively) in young children. It is characterized by red weals and a purple rash on the buttocks and lower legs due to bleeding into the skin from inflamed capillaries, together with arthritis, gastrointestinal symptoms, and (in some cases) nephritis. Glucocorticoids are often used for treatment. [E. H. Henoch (1820–1910), German paediatrician; J. L. Schönlein (1793–1864), German physician]

**henry** *n.* the **\*SI unit** of inductance, equal to the inductance of a closed circuit with a magnetic flux of 1 weber per ampere of current. Symbol: H.

**Henry equation** a formula used to predict the basal metabolic rate, and therefore the energy requirements, of a patient based on age, sex, and weight. *See* **BASAL METABOLISM**.

**Hensen's node (primitive knot)** the rounded front end of the embryonic **\*primitive streak**. [V. Hensen (1835–1924), German pathologist]

**heparin** *n.* an **\*anticoagulant** produced in liver cells, some white blood cells, and certain other sites, which acts by inhibiting the action of the enzyme **\*thrombin** in the final stage of **\*blood coagulation**. An extracted purified form of heparin is widely used for the prevention of blood coagulation both in patients with deep vein thrombosis and similar conditions and in blood collected for examination. The most important side-effect is bleeding. *See also* **LOW-MOLECULAR-WEIGHT HEPARIN**.

**hepat- (hepto-)** *combining form denoting* the liver. Examples: **hepatopexy** (surgical fixation of); **hepatorenal** (relating to the liver and kidney).

**hepatalgia** *n.* pain in or over the liver. It is usually caused by stretching of the outer covering (capsule) of the liver due to infection (especially liver

abscess), an enlarging liver tumour, or swelling (as in cardiac failure or *\*steatosis*).

**hepatectomy** *n.* the operation of removing the liver. **Partial hepatectomy** is the removal of one or more lobes of the liver; it may be carried out following trauma or to remove a localized tumour.

**hepatic** *adj.* relating to the liver.

**hepatic duct** *see* BILE DUCT.

**hepatic encephalopathy (portosystemic encephalopathy)** a condition in which brain function is impaired by the presence of toxic substances, absorbed from the colon, which are normally removed or detoxified by the liver. It occurs when the liver is severely damaged (as in cirrhosis) or bypassed. Symptoms include drowsiness, confusion, changes in personality, difficulty in performing tasks (e.g. writing), and coma. Treatment is mainly directed towards the underlying cause of liver disease and to any factors that may have precipitated the clinical deterioration (e.g. recent gastrointestinal haemorrhage, opiate medication, etc). Supportive measures consist of administering bowel cleansers (especially *\*lactulose*, orally or by enema) and reducing protein and/or salt intake.

**hepatic flexure** the bend in the *\*colon*, just underneath the liver, where the ascending colon joins the transverse colon.

**hepaticostomy** *n.* a surgical operation in which a temporary or permanent opening is made into the hepatic duct, the main duct carrying bile from the liver.

**hepatic vein** one of several short veins originating within the lobes of the liver as small branches, which unite to form the hepatic veins. These lead directly to the inferior vena cava, draining blood from the liver.

**hepatitis** *n.* inflammation of the liver caused by viruses, toxic substances (including alcohol), autoimmune disease, metabolic disease, or the excess deposition of fat (*see* NONALCOHOLIC FATTY LIVER DISEASE). **Infectious hepatitis** is caused by viruses, several types of which have been isolated. These include hepatitis A, hepatitis B, hepatitis C, hepatitis D, and hepatitis E. Other viral causes of hepatitis include *\*Epstein-Barr virus*,

*\*cytomegalovirus*, and rarely *\*herpes* simplex virus. **Hepatitis A** is transmitted by food or drink contaminated by a carrier or patient and commonly occurs where sanitation is poor. After an incubation period of 15–40 days, the patient develops fatigue, anorexia, nausea, vomiting, arthralgia, and fever. Yellow discoloration of the skin (*see* **JAUNDICE**) appears about a week later and persists for up to three weeks. The patient may be infectious throughout this period. Serious complications are unusual and an attack often confers immunity. Injection of *\*gammaglobulin* provides temporary protection, but active immunization is preferable.

**Hepatitis B** (formerly known as **serum hepatitis**) is transmitted by infected blood or blood products contaminating hypodermic needles, blood transfusions, or tattooing needles, by unprotected sexual contact, or (rarely) by contact with any other body fluid. It often occurs in drug users. Symptoms, which develop suddenly after an incubation period of 1–6 months, include headache, fever, chills, general weakness, and jaundice. Treatment includes *\*interferon* alfa and other oral antivirals (e.g. *\*lamivudine*, *\*adefovir dipivoxil*, entecavir). Most patients make a gradual recovery but the mortality rate is 5–20%. A vaccine is available.

**Hepatitis C** (formerly known as **non-A, non-B hepatitis**) has a mode of transmission similar to that of hepatitis B (predominantly intravenous drug abuse). Treatment is with interferon alfa, peginterferon alfa, ribavirin, telaprevir, and boceprevir.

**Hepatitis D** is a defective virus that can only proliferate when there is infection with hepatitis B. Patients with D virus usually have severe chronic hepatitis.

**Hepatitis E** is transmitted by infected food or drink and can cause acute hepatitis; it is especially severe in a pregnant patient.

**Chronic hepatitis** continues for months or years, eventually leading to *\*cirrhosis* and possibly to malignancy (*see* **HEPATOMA**). It is usually caused by chronic viral hepatitis, alcohol, or autoimmune disease.

**hepatization** *n.* the conversion of lung tissue, which normally holds air, into a solid liver-like mass during the course of acute lobar *\*pneumonia*. In the early stages of lobar pneumonia, the lungs show red hepatization due to the presence of red and white blood cells in the alveolar spaces. As the disease

progresses, the red cells are destroyed and phagocytosed, resulting in grey hepatization.

**hepto-** *combining form.* see **HEPAT-**.

**hepatoblastoma** *n.* a malignant tumour of the liver occurring in children, made up of embryonic liver cells. It is often confined to one lobe of the liver; such cases may be treated by a partial **\*hepatectomy**.

**hepatocellular** *adj.* relating to or affecting the cells of the liver.

**hepatocyte** *n.* the principal cell type in the **\*liver**. It has many functions, including protein synthesis and storage, carbohydrate and lipid metabolism, bile production, and detoxification.

**hepatoma (hepatocellular carcinoma)** *n.* the most common primary malignant tumour of the liver. In Western countries patients with chronic hepatitis B or C or cirrhosis are at significantly increased risk of developing hepatoma. The higher incidence of hepatomas in non-Western societies (particularly the Far East and Africa) is partly due to increased hepatitis B endemicity but other factors contribute, including exposure to fungi (see **AFLATOXIN**) and other ingested toxins. Hepatomas often synthesize **\*alpha-fetoprotein**, which is a useful serum tumour marker. The treatment options depend on the number and size of hepatomas and the staging of the disease. They include surgical resection, chemotherapy, **\*chemoembolization**, local ablative treatment, and liver transplantation.

**hepatomegaly** *n.* enlargement of the liver. This may be due to inflammation, infiltration (e.g. by fat), congestion (due to congestive heart failure), or tumour.

**hepatorenal syndrome** impairment of renal function, which can occur in acute or chronic liver disease. The condition is associated with intrarenal vasoconstriction and extrarenal vasodilation and hypotension, and the kidney disease is functional rather than structural in nature. There are two common clinical presentations. An acute form (type 1) is characterized by rapid spontaneous deterioration in renal function against a background of acute liver failure, acute alcoholic hepatitis, or acute decompensation of chronic cirrhotic liver disease. A chronic form (type 2) is characterized by insidious onset and slowly progressive deterioration in renal function. This is most

often observed in patients with decompensated cirrhosis and portal hypertension. The prognosis of hepatorenal syndrome is extremely poor, and the best hope of survival is usually with liver transplantation.

**hepatotoxic** *adj.* damaging or destroying liver cells. Certain drugs, such as **\*paracetamol**, can cause liver damage at high doses or with prolonged use.

**hepcidin** *n.* a peptide hormone, secreted by the liver, that regulates the entry of iron into the circulation. It inhibits iron transfer through ferroportin channels (which transport iron from inside to outside the cells), enabling cellular iron storage.

**hept- (hepta-)** *prefix denoting seven.*

**HER2** human epidermal growth factor receptor 2: a protein occurring in excessive amounts on the surface of tumour cells in highly malignant forms of breast cancer. It acts as an **\*epidermal growth factor receptor**, which influences the growth and proliferation of the tumour. *See also* **TRASTUZUMAB**.

**herbal medicine (herbalism)** the use of plants or plant extracts for medicinal purposes in order to improve the body's natural functions and restore balance. Herbal medicines are given in many forms (liquids, infusions, tablets, topical preparations, etc.) and form part of an increasing number of complementary medical therapies. *See* **PHYTOTHERAPY**.

**Herceptin** *n.* *see* **TRASTUZUMAB**.

**herd immunity** the immunity of a group, community, or population to an infectious disease as a result of mass vaccination. The higher the percentage of the population vaccinated, the greater will be the resistance to the spread of infection within the population.

**hereditary** *adj.* transmitted from parents to their offspring; inherited.

**hereditary multiple exostoses** *see* **EXOSTOSIS**.

**hereditary nonpolyposis colorectal cancer (HNPCC, Lynch syndrome)** an inherited disorder in which there is an increased incidence of colorectal **\*polyp** formation, although to a lesser extent than in familial adenomatous **\*polyposis** (FAP). HNPCC has also been associated with other types of

tumour, particularly ovarian and endometrial tumours. This increased risk is due to inherited mutations that impair DNA mismatch repair.

**hereditary periodic fever syndromes** a group of rare inherited disorders characterized by recurrent attacks of fever and inflammation in the absence of infection. They include familial Mediterranean fever (*see* **POLYSEROSITIS**), tumour necrosis factor receptor-associated periodic syndrome (TRAPS), and the cryopyrin-associated periodic syndrome (CAPS). Causative gene mutations have been identified.

**heredity** *n.* the process that causes the biological similarity between parents and their offspring. \***Genetics** is the study of heredity.

**heredo-** *combining form denoting* heredity.

**Hering–Breuer reflex** the normal physiological reflex to breathe out when the breath is held in inspiration and to breathe in when it is held in exhalation. [H. E. Hering (1866–1948), German physiologist; J. Breuer (1842–1925), German physician]

**hermaphrodite** *n.* a former term for an individual having both male and female sex organs or sex organs containing both ovarian and testicular cells. It is now considered offensive. *See* **INTERSEX**.

**hermeneutics** *n.* the practice of interpreting literary and historical texts in relation to one another and to their various contexts. By extension, in \***clinical ethics**, interpreting the ‘text’ of an ill patient in terms of history taking, physical examination, diagnostic tests, and listening to the patient’s account of their own experience.

**hernia** *n.* the protrusion of an organ or tissue out of the body cavity in which it normally lies. An **inguinal hernia** (or **rupture**) occurs in the lower abdomen; a sac of peritoneum, containing fat or part of the bowel, bulges through a weak part (inguinal canal) of the abdominal wall. It may result from physical straining or coughing. A **scrotal hernia** is an inguinal hernia so large that it passes into the scrotum; a **femoral hernia** is similar to an inguinal hernia but protrudes at the top of the thigh, through the point at which the femoral artery passes from the abdomen to the thigh. Other hernias of the abdominal wall include periumbilical, epigastric, and postsurgical hernias. A **diaphragmatic hernia** is the protrusion of an abdominal organ through the

diaphragm into the chest cavity; the most common type is the **hiatus hernia**, in which the stomach passes partly or completely into the chest cavity through the opening (hiatus) for the oesophagus. This may be associated with **\*gastro-oesophageal reflux**, although most patients have no symptoms.

Hernias may be complicated by becoming impossible to return to their normal site (**irreducible**); swollen and fixed within their sac (**incarcerated**); or cut off from their blood supply, becoming painful and eventually gangrenous (**strangulated**). The best treatment for hernias, especially if they are painful, is surgical repair (*see* **HERNIOPLASTY**).

**hernia-en-glissade** an inguinal **\*hernia** that has an element of descent ('slide') of related structures alongside the sac.

**hernio-** *combining form denoting a hernia.*

**hernioplasty** *n.* the surgical operation to repair a hernia, in which the sac is excised (**\*herniotomy**), the abnormal opening is sewn up, and the weakness strengthened, most commonly using a mesh of polypropylene.

**herniorrhaphy** *n.* surgical repair of a hernia. It can be performed through a **\*laparoscope**. *See also* **HERNIOPLASTY**; **HERNIOTOMY**.

**herniotomy** *n.* excision of a hernial sac: the first stage of the surgical repair of a hernia. In infants and young muscular subjects it is all that is needed to cure the hernia.

**heroic measures** a mainly US term for therapies instituted to save a patient's life when all other options have failed. These may have serious or even fatal side-effects, but the risk is considered worth taking since the patient will surely otherwise die. Many people specify 'no heroic measures' in their **\*advance directive** ('living will').

**heroin** *n.* a white crystalline powder derived from **\*morphine** that is a highly addictive drug of abuse. *See also* **DIAMORPHINE**.

**heroin-associated nephropathy** *see* **HAN**.

**herpangina** *n.* an acute viral infection, occurring predominantly in children, that causes a fever of sudden onset associated with malaise and acute ulceration of the soft palate and tonsillar area. It usually lasts 2–5 days.

**herpes** *n.* inflammation of the skin or mucous membranes that is caused by **\*herpesviruses** and characterized by collections of small blisters. There are two types of **herpes simplex virus** (HSV): type I causes the common **cold sore**, usually present on or around the lips; type II is mainly associated with **genital herpes** and is sexually transmitted. However, types I and II can both cause either genital herpes or cold sores, depending on the site of initial infection. HSV blisters are contagious through skin-to-skin contact and are recurrent in some people. HSV can also affect the conjunctiva (*see also* **DENDRITIC ULCER**).

**Herpes zoster (shingles)** is caused by the varicella-zoster virus, which also causes chickenpox. Following an attack of chickenpox, the virus lies dormant in the dorsal root ganglia of the spinal cord. Later, under one of a number of influences, the virus migrates down the sensory nerve to affect one or more **\*dermatomes** on the skin in a band, causing the characteristic shingles rash. One side of the face or an eye (**ophthalmic zoster**) may be involved. Shingles may be chronically painful (**post-herpetic neuralgia**), especially in the elderly. *See also* **RAMSAY HUNT SYNDROME**.

Treatment of all forms of herpes is with an appropriate preparation of **\*aciclovir** or related antiviral drugs; shingles may require potent analgesics and treatment of secondary bacterial infection.

**herpesvirus** *n.* one of a group of DNA-containing viruses causing latent infections in animals (including humans). The herpesviruses are the causative agents of **\*herpes** and chickenpox. The group also includes the **\*cytomegalovirus** and **\*Epstein–Barr virus**. *Herpesvirus simiae* (**virus B**) causes an infection in monkeys similar to herpes simplex, but when transmitted to humans it can produce fatal encephalitis.

**hertz** *n.* the **\*SI unit** of frequency, equal to one cycle per second. Symbol: Hz.

**Herxheimer reaction** *see* **JARISCH-HERXHEIMER REACTION**.

**hesitation** *n.* a **\*lower urinary tract symptom** in which there is a delay between being ready to pass urine and the actual flow of urine. It is often associated with bladder outflow obstruction.

**heter- (hetero-)** *combining form denoting* difference; dissimilarity.

**heterochromatin** *n.* chromosome material (see **CHROMATIN**) that stains most deeply when the cell is not dividing. It is thought not to represent major genes but may be involved in controlling these genes, and also in controlling mitosis and development. *Compare* **EUCHROMATIN**.

**heterochromia** *n.* colour difference in the iris of the eye, which is usually congenital but is occasionally secondary to inflammation of the iris (as in \*Fuchs' heterochromic cyclitis). In **heterochromia iridis** one iris differs in colour from the other; in **heterochromia iridum** one part of the iris differs in colour from the rest. —**heterochromic** *adj.*

**heterogametic** *adj.* describing the sex that produces two different kinds of gamete, which carry different \*sex chromosomes, and that therefore determines the sex of the offspring. In humans men are the heterogametic sex: the sperm cells carry either an X or a Y chromosome. *Compare* **HOMOGAMETIC**.

**heterogeneity** *n.* (in oncology) variability or differences in the properties of cells within a tumour.

**heterograft** *n.* see **XENOGRAFT**.

**heterophoria** *n.* a tendency to squint. Normally both the eyes work together and look at the same point simultaneously, but if one eye is covered it will move out of alignment with the object the other eye is still viewing. When the cover is removed the eye immediately returns to its normal position. Most people have a small degree of heterophoria in which the covered eye turns outwards, away from the nose (**exophoria**; compare **ESOPHORIA**). Heterophoria may produce eyestrain because of the unconscious effort required to keep the two eyes aligned. *See also* **STRABISMUS**.

**Heterophyes** *n.* a genus of small parasitic \*flukes occurring in Egypt and the Far East. Adult flukes of the species *H. heterophyes* live in the small intestine of humans and other fish-eating animals; in humans the flukes can produce serious symptoms (see **HETEROPHYIASIS**). The fluke has two intermediate hosts, a snail and a mullet fish.

**heterophyiasis** *n.* an infestation of the small intestine with the parasitic fluke \**Heterophyes heterophyes*. Humans become infected on eating raw or salted

fish that contains the larval stage of the fluke. The presence of adult flukes may provoke symptoms of abdominal pain and diarrhoea; if the eggs reach the brain, spinal cord, and heart (via the bloodstream) they produce serious lesions. Tetrachloroethylene may be used in treatment of the infection.

**heteropsia** *n.* different vision in each eye.

**heterosis** *n.* hybrid vigour: the increased sturdiness, resistance to disease, etc., of animals whose parents are genetically different compared both with their parents and with the offspring of genetically similar parents.

**heterotopia (heterotopy)** *n.* the displacement of an organ or part of the body from its normal position.

**heterotopic transplantation** *see* **ORTHOTOPIC TRANSPLANTATION**.

**heterotrophic (organotrophic)** *adj.* describing organisms (known as heterotrophs) that use complex organic compounds to synthesize their own organic materials. Most heterotrophs are **chemoheterotrophic**, i.e. they use the organic compounds as an energy source. This group includes the majority of bacteria and all animals and fungi. *Compare* **AUTOTROPHIC**.

**heterotropia** *n.* *see* **STRABISMUS**.

**heterozygous** *adj.* describing an individual in whom the members of a pair of genes determining a particular characteristic are dissimilar. *See* **ALLELE**. *Compare* **HOMOZYGOUS**. —**heterozygote** *n.*

**hex- (hexa-)** *combining form denoting* six.

**hexacanth** *n.* *see* **ONCOSPHERE**.

**hexachromia** *n.* the ability to distinguish only six of the seven colours of the spectrum, the exception being indigo. Most people cannot distinguish indigo from blue or violet.

**hexamine** *n.* *see* **METHENAMINE**.

**hexokinase** *n.* an enzyme that catalyses the conversion of glucose to glucose-6-phosphate. This is the first stage of **\*glycolysis**.

**hexosamine** *n.* the amino derivative of a **\*hexose** sugar. The two most important hexosamines are **\*glucosamine** and galactosamine.

**hexose** *n.* a simple sugar with six carbon atoms. Hexose sugars are the sugars most frequently found in food. The most important hexose is **\*glucose**.

**HHS** *see* **DEPARTMENT OF HEALTH AND HUMAN SERVICES**.

**HIA** *see* **HEALTH IMPACT ASSESSMENT**.

**5-HIAA** *see* **5-HYDROXYINDOLEACETIC ACID**.

**hiatus** *n.* an opening or aperture. For example, the diaphragm contains hiatuses for the oesophagus and aorta.

**hiatus hernia** *see* **HERNIA**.

**hibernating myocardium** an area of heart muscle subject to critical coronary ischaemia sufficient to cause reversible impairment of function but insufficient to result in death of the muscle. Also known as **viable myocardium**, it is detected by MRI scanning of the heart. The clinical importance is that restoration of normal coronary blood flow may improve heart muscle contraction.

**Hib/MenC** a combined vaccine that protects against *Haemophilus influenzae* type b infection (*see* **HIB VACCINE**) and meningococcal disease (*see* **MENINGITIS C VACCINE**). It is offered to all babies at the age of 1 year. *See also* **IMMUNIZATION**.

**Hib vaccine** a vaccine that gives protection against the bacterium *Haemophilus influenzae* type b (Hib). Before the introduction of the vaccine in the UK in 1992, Hib was the commonest cause of meningitis in children under the age of 2 years. The vaccine, which has an excellent safety record, is currently given with the primary vaccines at 2, 3, and 4 months of age and as a booster at 12 months of age to extend protection against Hib meningitis. *See* **IMMUNIZATION**.

**hiccup** *n.* abrupt involuntary lowering of the diaphragm and closure of the sound-producing folds at the upper end of the trachea, producing a characteristic sound as the breath is drawn in. Hiccups, which usually occur

repeatedly, may be caused by indigestion or more serious disorders, such as alcoholism. Medical name: **singultus**.

**Hickman catheter** a fine plastic cannula usually inserted into the subclavian vein in the neck to allow administration of drugs and repeated blood samples. The catheter is tunnelled for several centimetres beneath the skin to prevent infection entering the bloodstream. It is used most frequently in patients receiving long-term chemotherapy, particularly infusion regimes (e.g. fluorouracil).

**hidr- (hidro-)** *combining form denoting sweat*. Example: **hidropoiesis** (formation of).

**hidradenitis suppurativa** an unpleasant condition characterized by deep abscesses in the armpits, groin, and anogenital regions leading to sinuses and bridge scarring. It is regarded as part of the **\*follicular occlusion tetrad**. It is three times more common in women and may be under androgen control. Treatment is by weight loss, smoking cessation, long-term antibiotics, anti-androgens, or occasionally surgery. The condition is difficult to treat but often resolves spontaneously after many years.

**hidrosis** *n.* **1.** the excretion of sweat. **2.** excessive sweating.

**hidrotic** *n.* an agent that causes sweating. **\*Parasympathomimetic** drugs are hidrotics.

**HIE** *see* **HYPOXIC-ISCHAEMIC ENCEPHALOPATHY**.

**HIFU** high-intensity focused **\*ultrasound**: a minimally invasive technique used for the treatment of primary localized prostate cancer and prostate cancer that has recurred after radiotherapy. An ultrasound probe is inserted into the rectum and precisely focuses a beam of high-intensity ultrasound on the cancerous tissue resulting in coagulative necrosis by raising the temperature of the target tissue to approximately 90°C. The procedure may have fewer side-effects than other treatments for localized prostate cancer.

**high-density lipoprotein (HDL)** the smallest and densest of the **\*lipoproteins** that carry cholesterol and triglycerides around the body, which is derived mainly from precursors produced in the liver. HDL has an important role in reverse cholesterol transfer, i.e. the removal of cholesterol

from the circulation and the blood vessel walls and its transfer to the liver. Higher levels of HDL have been shown to be associated with lower levels of cardiovascular disease.

**high-dependency unit (HDU)** a hospital unit that provides specialist nursing care to seriously ill patients. The level of care given is greater than that available on general wards but less than in *\*intensive therapy units*.

**high-intensity focused ultrasound** *see* HIFU; ULTRASOUND.

**hilar cell tumour** an androgen-producing tumour of the ovary found in older women and often resulting in *\*virilization*. Such tumours are so called as they tend to occur around the area of the ovary where the blood vessels enter (the hilum). They are usually small and are treated by surgical removal, with resolution of most of the symptoms.

**hilum** *n. (pl. hila)* a hollow situated on the surface of an organ, such as the ovary, kidney, or spleen, at which structures such as blood vessels, nerve fibres, and ducts enter or leave it.

**hindbrain (rhombencephalon)** *n.* the part of the *\*brain* comprising the cerebellum, pons, and medulla oblongata. The pons and medulla contain the nuclei of many of the cranial nerves, which issue from their surfaces, and the reticular formation. The fluid-filled cavity in the midline is the fourth *\*ventricle*.

**hindgut** *n.* the back part of the embryonic gut, which gives rise to part of the large intestine, the rectum, bladder, and urinary ducts. *See also* CLOACA.

**hindquarter amputation** an operation involving removal of an entire leg and part or all of the pelvis associated with it. It is usually performed for soft tissue or bone sarcomas arising from the upper thigh, hip, or buttock. *Compare* FOREQUARTER AMPUTATION.

**hinge joint** *see* GINGLYMUS.

**hip** *n.* the region of the body where the thigh bone (femur) articulates with the *\*pelvis*: the region on each side of the pelvis.

**hip bone (innominate bone)** a bone formed by the fusion of the ilium, ischium, and pubis. It articulates with the femur by the **acetabulum** of the

ilium, a deep socket into which the head of the femur fits (see [HIP JOINT](#)). Between the pubis and ischium, below and slightly in front of the acetabulum, is a large opening – the **obturator foramen**. The right and left hip bones form part of the [\\*pelvis](#).

**hip girdle** see [PELVIC GIRDLE](#).

**hip joint** the ball-and-socket joint (see [ENARTHROSIS](#)) between the head of the femur and the acetabulum (socket) of the ilium (see [HIP BONE](#)). It is a common site of osteoarthritis and rheumatoid arthritis, which is often treated surgically (by [\\*hip replacement](#)). See also [CONGENITAL DISLOCATION OF THE HIP](#).

**Hippelates** *n.* a genus of small flies. The adults of *H. pallipes* are suspected of transmitting [\\*yaws](#) in the West Indies. Other species of *Hippelates* may be involved in the transmission of conjunctivitis.

**hippocampal formation** a curved band of cortex lying within each cerebral hemisphere: in evolutionary terms one of the brain's most primitive parts. It forms a portion of the [\\*limbic system](#) and is involved in the complex physical aspects of behaviour governed by emotion and instinct.

**hippocampus** *n.* a swelling in the floor of the lateral [\\*ventricle](#) of the brain. It contains complex foldings of cortical tissue and is involved, with other connections of the [\\*hippocampal formation](#), in the workings of the [\\*limbic system](#). —**hippocampal** *adj.*

**Hippocratic oath** an oath that is often assumed to be taken but is actually rarely sworn by doctors. It is a code of behaviour and practice commonly attributed to the Greek physician Hippocrates (460–370 BC), known as the ‘Father of Medicine’, and taken by the students of the medical school in Cos where he taught, but both the authorship and application of the oath to Hippocrates’ students has been disputed. The ideas promulgated by the original oath are now seriously out of date (for instance there is no discussion of [\\*truth-telling](#)), and some medical schools have created modern alternatives for their own use. See also [BENEFICENCE](#); [MEDICAL ETHICS](#).

**Hippuran** *n.* trade name for sodium iodohippurate, used as a contrast medium in radiology of the urinary tract. Labelled with iodine-131, it can be used to

measure renal function, although it has now largely been replaced by other agents.

**hippus** *n.* abnormal rhythmical variations in the size of the pupils, independent of the intensity of the light falling on the eyes. It is occasionally seen in various diseases of the nervous system.

**hip replacement** a surgical procedure developed for replacing a diseased hip joint with a prosthesis. A plastic or metal cup forms the socket, and the head of the femur is replaced by a metal ball on a stem placed inside the femur. There are many types of prosthesis, which can be fixed to the bone with or without cement. *See also* **ARTHROPLASTY**.

**Hirschsprung's disease** a congenital condition in which the rectum and sometimes part of the lower colon have failed to develop a normal nerve network. The affected portion does not expand or conduct the contents of the bowel, which accumulate in and distend the colon. Symptoms, which are usually apparent in the first weeks of life, are vomiting, constipation, abdominal distension, and intestinal obstruction. Diagnosis is by rectal biopsy (to confirm the absence of nerve cells), anorectal **\*manometry**, and imaging. Treatment involves surgical removal of the affected segment and anastomosis of the remaining healthy bowel to the anus. *See also* **MEGACOLON**. [H. Hirschsprung (1830–1916), Danish physician]

**hirsutism** *n.* the presence of coarse pigmented hair on the face, chest, upper back, or abdomen in a female as a result of **\*hyperandrogenism** (excessive production of androgen). *See also* **VIRILIZATION**.

**hirudin** *n.* an **\*anticoagulant** present in the salivary glands of **\*leeches** and in certain snake venoms that prevents **\*blood coagulation** by inhibiting the action of the enzyme **\*thrombin**. The anticoagulant **bivalirudin** is a genetically engineered form of hirudin from the medicinal leech. It is administered by intravenous injection and infusion, in combination with aspirin and clopidogrel, to treat patients with S–T elevation **\*myocardial infarction** who are undergoing primary **\*percutaneous coronary intervention**.

**hist-** (**histio-**, **histo-**) *combining form denoting* tissue.

**histaminase** *n.* an enzyme, widely distributed in the body, that is responsible for the inactivation of histamine.

**histamine** *n.* a compound derived from the amino acid histidine. It is found in nearly all tissues of the body, associated mainly with the **\*mast cells**. Histamine has pronounced pharmacological activity, causing dilation of blood vessels and contraction of smooth muscle (for example, in the lungs). It is an important mediator of inflammation and is released in large amounts after skin damage (such as that due to animal venoms and toxins), producing a characteristic skin reaction (consisting of flushing, a flare, and a weal). Histamine is also released in anaphylactic reactions and allergic conditions, including asthma, and gives rise to some of the symptoms of these conditions. *See also* **ANAPHYLAXIS**; **ANTI HISTAMINE**.

**histamine acid phosphate** a derivative of **\*histamine** that was formerly used to test for acid secretion in the stomach in conditions involving abnormal gastric acid secretion, such as **\*Zollinger-Ellison syndrome**.

**histidine** *n.* an **\*amino acid** from which **\*histamine** is derived.

**histiocyte** *n.* a fixed **\*macrophage**, i.e. one that is stationary within connective tissue.

**histiocyoma** *n.* a tumour that contains **\*macrophages** or **\*histiocytes**, large cells with the ability to engulf foreign matter and bacteria. *See also* **FIBROSARCOMA**.

**histiocytosis** *n.* any of a group of diseases in which there are abnormalities in certain large phagocytic cells (**\*histiocytes**) due to (1) abnormal storage of fats, as in **\*Gaucher's disease**; (2) inflammatory disorders, as in **\*Langerhans cell histiocytosis**, which includes disorders previously called histiocytosis X; or (3) malignant proliferation of histiocytes.

**histochemistry** *n.* the study of the identification and distribution of chemical compounds within and between cells, by means of stains, indicators, and light and electron microscopy. — **histochemical** *adj.*

**histocompatibility** *n.* the form of **\*compatibility** that depends upon tissue components, mainly specific glycoprotein antigens in cell membranes. A high degree of histocompatibility is necessary for a tissue graft or organ transplant to be successful. — **histocompatible** *adj.*

**histogenesis** *n.* the formation of tissues.

**histogram** *n.* a form of statistical graph in which values are plotted in the form of rectangles on a chart; a bar-chart.

**histoid** *adj.* **1.** resembling normal tissue. **2.** composed of one type of tissue.

**histology** *n.* the study of the structure of tissues by means of special staining techniques combined with light and electron microscopy. — **histological** *adj.*

**histone** *n.* a simple protein that combines with a nucleic acid to form a \*nucleoprotein.

**Histoplasma** *n.* a genus of parasitic yeastlike fungi. The species *H. capsulatum* causes the respiratory infection \*histoplasmosis.

**histoplasmin** *n.* a preparation of antigenic material from a culture of the fungus *Histoplasma capsulatum*, used to test for the presence of the disease \*histoplasmosis by subcutaneous injection.

**histoplasmosis** *n.* an infection caused by inhaling spores of the fungus *Histoplasma capsulatum*. The primary pulmonary form usually produces no symptoms or harmful effects and is recognized retrospectively by X-rays and positive \*histoplasmin skin testing. Occasionally, progressive histoplasmosis, which resembles tuberculosis, develops. The fungus may spread via the bloodstream to attack other organs, such as the liver, spleen, lymph nodes, or intestine. Symptomatic disease is treated with intravenous amphotericin. The spores are found in soil contaminated by faeces, especially from chickens and bats. The disease is endemic in the northern and central USA, Argentina, Brazil, Venezuela, and parts of Africa.

**histotoxic** *adj.* poisonous to tissues: applied to certain substances and conditions.

**histrionic personality disorder** a type of \*personality disorder characterized by excessive emotionality and attention-seeking, self-dramatization, inappropriately seductive behaviour, and an excessive need for approval. It affects more women than men. Classified as a specific personality disorder in DSM-IV-TR, in DSM-5 it is treated as a subtype of \*narcissistic personality disorder.

**HIV (human immunodeficiency virus)** a \*retrovirus responsible for \*AIDS. There are two varieties, HIV-1 and HIV-2; the latter is most common in

Africa. *See also* [HTLV](#).

**HIVAN** human immunodeficiency virus-associated nephropathy: a condition associated with HIV infection. The patient usually presents with nephrotic-range proteinuria (*see* [NEPHROTIC SYNDROME](#)) with microscopic haematuria, without oedema but with a rapid decline in renal function. Enlargement of the kidneys on ultrasound examination is a common finding, and HIVAN may precede other manifestations of HIV infection. Typical renal pathological findings are of a collapsing form of *\*focal segmental glomerulosclerosis*. The clinical course is usually one of rapid decline in renal function.

**hives** *n. see* [URTICARIA](#).

**HLA system** human leucocyte antigen system: a series of four gene families (termed A, B, C, and D) that code for polymorphic proteins expressed on the surface of most nucleated cells. Individuals inherit from each parent one gene (or set of genes) for each subdivision of the HLA system. If two individuals have identical HLA types, they are said to be histocompatible. Successful tissue transplantation requires a minimum number of HLA differences between donor and recipient tissues.

**HMG CoA reductase** *hydroxymethylglutaryl coenzyme A* reductase: the key rate-limiting enzyme that is involved in the production of cholesterol in the liver. Inhibition of its action is the mechanism by which the *\*statin* group of lipid-lowering agents work.

**HNA** *see* [HEALTH NEEDS ASSESSMENT](#).

**HNPCC** *see* [HEREDITARY NONPOLYPOSIS COLORECTAL CANCER](#).

**hoarding disorder** a condition in which a person struggles to discard useless or worn-out possessions, acquires an excessive number of such items, and stores them in a chaotic manner resulting in unmanageable clutter. The items are nearly always of little or no monetary value, although valuable items are often found mixed indiscriminately with the rest. Hoarding disorder was included in DSM-5 in 2013 as a new disorder and has been considered for introduction in ICD-11.

**hobnail liver** the liver of a patient with \***cirrhosis**, which has a knobbly appearance caused by regenerating nodules separated by bands of fibrous tissue.

**Hodgkin's disease** a malignant disease of lymphatic tissue – a form of \***lymphoma** – usually characterized by painless enlargement of one or more groups of lymph nodes in the neck, axillae (armpits), groin, chest, or abdomen; the spleen, liver, bone marrow, and bones may also be involved. Apart from the enlarging nodes, there may also be weight loss, fever, profuse sweating at night, and itching (known as **B symptoms**). Hodgkin's disease is distinguished from other forms of lymphoma by the presence of large binucleate cells (**Reed–Sternberg cells**) in the affected lymph nodes. Treatment depends on the extent of disease and may include surgery, radiotherapy, drug therapy, or a combination of these. Drugs used in the treatment of the disease include vincristine, procarbazine, prednisolone, chlorambucil, and vinblastine. Many patients can be cured; in the early stages of the disease this may be in the order of 90% or more. [T. Hodgkin (1798–1866), British physician]

**Hoffmann's sign (finger-flexion reflex)** an abnormal reflex elicited by flicking the distal phalanx of the patient's middle finger sharply downwards. Hoffmann's sign is positive when there is a brisk flexion response in the index finger and thumb. It indicates an upper \***motor neuron** response due to a disorder at or above the cervical (neck) level of the spinal cord. [J. Hoffmann (1857–1919), German neurologist]

**hole in the heart** *see* **SEPTAL DEFECT**.

**holistic** *adj.* describing an approach to patient care in which the physical, mental, and social factors in the patient's condition are taken into account, rather than just the diagnosed disease. The term is often used in relation to public health and is also applied to a range of orthodox and complementary methods of treatment. *See also* **COMPLEMENTARY MEDICINE**.

**Hollister ring** a watertight adherent ring placed around an intestinal \***stoma** and incorporating a flange to which a disposable plastic bag could be attached. It was the forerunner of modern disposable stoma bags.

**Holmes-Adie syndrome** *see* **ADIE'S SYNDROME**.

**holmium:YAG laser** a type of **\*YAG laser** that uses a short-pulsed high-energy beam with a wavelength of 2100 nm to cut, perforate, and fragment tissue. It has a penetration of 0.4 mm. This laser is used in the fragmentation of urinary tract calculi (stones) and in **\*enucleation** of the prostate gland.

**holo-** *combining form denoting complete or entire.*

**holocrine** *adj.* describing a gland or type of secretion in which the entire cell disintegrates when the product is released.

**Homans' sign** a test for deep vein thrombosis of the calf. With the patient lying supine, the examiner squeezes the calf firmly and dorsiflexes the foot; the test is positive if deep-seated pain is felt in the calf. [J. Homans (1877–1954), US physician]

**home delivery** *see* **COMMUNITY MIDWIFE.**

**home help** *see* **CARE ASSISTANT.**

**homeo-** (**homoeo-**) *combining form denoting similar; like.*

**homeopathy (homoeopathy)** *n.* a complementary therapy based on the theory that 'like cures like'. It involves a belief that conditions may be treated with a tiny dose of a substance, so diluted as to be indistinguishable from pure water, that in larger doses would normally cause or aggravate that condition. A second principle is a process of dilution and shaking known as 'succussion'. Homeopathy was developed by a German doctor, Samuel Hahnemann (1755–1843), in 1796. It was described as 'scientifically implausible' by the UK's Chief Medical Officer in 2010 and is not recommended by NICE. —**homeopathic** *adj.* —**homeopathist** *n.*

**homeostasis** *n.* the physiological process by which the internal systems of the body (e.g. blood pressure, body temperature, **\*acid-base balance**) are maintained at equilibrium, despite variations in the external conditions. —**homeostatic** *adj.*

**home visit** *see* **DOMICILIARY CONSULTATION.**

**homo-** *combining form denoting the same or common.*

**homocysteine** *n.* a sulphur-containing amino acid that is an intermediate in the synthesis of **\*cysteine**. A deficiency in the enzyme cystathionine synthetase results in elevated levels in the blood of homocysteine and homocystine (an oxidized form of homocysteine), resulting in elevated urinary levels (*see* **HOMOCYSTINURIA**). It is becoming increasingly recognized that elevated levels of homocysteine in the blood are a risk factor for vascular disease independent of diabetes, hypertension, elevated levels of cholesterol in the blood, and smoking. Levels are also elevated in vitamin B<sub>12</sub> deficiency.

**homocystinuria** *n.* an **\*inborn error of metabolism**, inherited as an autosomal **\*recessive** trait, caused by an enzyme deficiency resulting in an excess of **\*homocysteine** in the blood and the presence of homocystine in the urine. Clinically affected individuals have learning disabilities, are excessively tall with long fingers (due to overgrowth of bones), generally have loose ligaments (which may result in dislocation of the lens), and have a tendency to form blood clots in the veins and arteries, leading to strokes. Treatment is by diet, which may allow for normal development if the disease is recognized early enough, and high-dose vitamin B<sub>6</sub> therapy.

**homoeopathy** *n.* *see* **HOMEOPATHY**.

**homogametic** *adj.* describing the sex that produces only one kind of gamete, which carries the same **\*sex chromosome**, and that therefore does not determine the sex of the offspring. In humans women are the homogametic sex: each egg cell carries an X chromosome. *Compare* **HETEROGAMETIC**.

**homogenize** *vb.* to reduce material to a uniform consistency, e.g. by crushing and mixing. Organs and tissues are homogenized to determine their overall content of a particular enzyme or other substance. — **homogenization** *n.*

**homogentisic acid** a product formed during the metabolism of the amino acids phenylalanine and tyrosine. In normal individuals homogentisic acid is oxidized by the enzyme **homogentisic acid oxidase**. In rare cases this enzyme is lacking and a condition known as **\*alcaptonuria**, in which large amounts of homogentisic acid are excreted in the urine, results.

**homograft** *n.* *see* **ALLOGRAFT**.

**homoiothermic** *adj.* warm-blooded: able to maintain a constant body temperature independently of, and despite variations in, the temperature of the surroundings. Mammals (including humans) and birds are homoiothermic. Compare **POIKILOTHERMIC**. —**homoiothermy** *n.*

**homolateral** *adj.* *see* **IPSILATERAL**.

**homologous** *adj.* **1.** (in anatomy) describing organs or parts that have the same basic structure and evolutionary origin, but not necessarily the same function or superficial structure. Compare **ANALOGOUS**. **2.** (in genetics) describing a pair of chromosomes of similar shape and size and having identical gene loci. One member of the pair is derived from the mother; the other from the father.

**homonymous** *adj.* describing a visual defect in which the visual field to one side of the body is restricted in both eyes (*see* **HEMIANOPIA**).

**homozygous** *adj.* describing an individual in whom the members of a pair of genes determining a particular characteristic are identical. *See* **ALLELE**. Compare **HETEROZYGOUS**. —**homozygote** *n.*

**homunculus** *n.* **1. (manikin)** a dwarf with no deformity or abnormality other than small size. **2. (manikin)** a small jointed anatomical model of a man. **3.** (in early biological theory) a miniature human being thought to be contained within each of the reproductive cells.

**honeycomb lung** the honeycomb pattern seen on X-ray at the later stages of chronic lung conditions, in which the lungs become less elastic and more fibrotic. Once the honeycomb appearance is visible on the X-ray, the lungs are likely to progress to respiratory failure.

**HONK** *see* **HYPEROSMOLAR HYPERGLYCAEMIC STATE**.

**hook** *n.* a surgical instrument with a bent or curved tip, used to hold, lift, or retract tissue at operation.

**hookworm** *n.* either of two nematode worms, *\*Necator americanus* or *\*Ancylostoma duodenale*, which live as parasites in the human intestine. Both species, also known as the New and Old World hookworms respectively, are of great medical importance (*see* **HOOKWORM DISEASE**).

**hookworm disease** a condition resulting from an infestation of the small intestine by hookworms. Hookworm larvae live in the soil and infect humans by penetrating the skin. The worms travel to the lungs in the bloodstream and from there pass via the windpipe and gullet to the small intestine. Heavy hookworm infections may cause considerable damage to the wall of the intestine, leading to a serious loss of blood; this, in conjunction with malnutrition, can provoke severe anaemia. Symptoms include itching and rash at the site of infection, followed by abdominal pain, diarrhoea, debility, and mental inertia. More serious effects can include difficulty in breathing, heart enlargement, and irregular heartbeat. The disease occurs mostly in the tropics and subtropics; mebendazole is used in treatment.

**hordeolum** *n.* *see* [STYE](#).

**horizontal transmission** the spread of an infectious agent from one person or group to another, usually through contact with contaminated material, such as sputum or faeces. *Compare* [VERTICAL TRANSMISSION](#).

**hormone** *n.* a substance that is produced in one part of the body (by an [\\*endocrine gland](#), such as the thyroid, adrenal, or pituitary), passes into the bloodstream and is carried to other (distant) organs or tissues, where it acts to modify their structure or function. Examples of hormones are corticosteroids (from the adrenal cortex), adrenaline (from the adrenal medulla), androgens and oestrogens (from the testis and ovary, respectively), thyroid hormone (from the thyroid gland), and insulin (from the islets of Langerhans). The [\\*pituitary gland](#) secretes a variety of hormones, whose release is controlled by specific releasing hormones.

**hormone-binding globulins** a family of plasma proteins whose function is to bind free hormone molecules to varying degrees and thus reduce their function. Alterations in levels of the binding globulins, for example during pregnancy or ill health, can result in variations in assays of hormone levels in individuals. Examples include **thyroid-binding globulin**, **sex-hormone-binding globulin**, and **corticosteroid-binding globulin**.

**hormone replacement therapy (HRT)** the use of female hormones for the relief of symptoms resulting from cessation of ovarian function, either at the time of the natural [\\*menopause](#) or following surgical removal of the ovaries. Oestrogenic hormones may be prescribed orally, transdermally (as skin

patches or gel), or by subcutaneous implant. The combination of progestogen with oestrogen is preferred if the woman has retained her uterus, since administration of oestrogen alone might cause overstimulation of the endometrium or even cancer. HRT is effective against *\*vasomotor symptoms* (e.g. hot flushes) and genitourinary atrophy (causing vaginal dryness); for the best results it should be started as soon as the symptoms first appear. Because studies indicate that HRT may increase the risk of breast cancer, stroke, and other conditions associated with ageing, it should be used only in the short term (no more than five years) in women over 50 and is no longer recommended for the prevention of osteoporosis.

**horn** *n.* (in anatomy) a process, outgrowth, or extension of an organ or other structure. It is often paired. In the spinal cord crescent-shaped areas of grey matter (seen in cross section) are known as the dorsal and ventral horns.

**Horner's syndrome** a syndrome consisting of a constricted pupil (miosis), drooping of the upper eyelid (*\*ptosis*), and an absence of sweating over the affected side of the face. The symptoms are due to a disorder of the sympathetic nerves in the brainstem or cervical (neck) region. [J. F. Horner (1831–86), Swiss ophthalmologist]

**horseshoe kidney** an anatomical variation in kidney development whereby the lower poles of both kidneys are joined together. This usually causes no trouble but it may be associated with impaired drainage of urine from the kidney by the ureters, which cross in front of the united lower segment. The condition is associated with *\*Turner's syndrome*, and there is a small increase in the incidence of *\*nephroblastoma* in those with horseshoe kidney.

**hospice** *n.* an institution that provides palliative or end-of-life care for people with terminal illnesses. Most modern hospices are modelled on St Christopher's Hospice, founded in London in 1967 by Dame Cicely Saunders. They specialize in symptom management and often also provide spiritual and psychological help. Support for the families of the patients is also a feature of the services provided by most hospices. **Hospice at Home** services provide specialist palliative care for terminally ill patients in their own homes. *See also* *DYING*; *PALLIATIVE*.

**hospital** *n.* an institution providing medical or psychiatric care and treatment of patients. Such care may be residential (in-patient), including the care of

patients for a whole day and their return home at night (day care). Out-patient services include consultation with specialists by prior appointment, X-rays, laboratory tests, physiotherapy, and accident and emergency services for those requiring urgent care. Most health districts have a **district general hospital (DGH)**, which provides sufficient basic services for the population of the district. Some larger hospitals have resources that are more highly specialized, to meet the needs of a wider population, providing so-called **regional** or **supraregional (national)** services. Such hospitals often provide training for medical students (**teaching** or **university hospitals**) and for postgraduate education. Some smaller hospitals – known as **community hospitals** – may be staffed by general practitioners and are intended for people for whom home care is not practicable on social grounds. Within the NHS, individual hospitals or groups of hospitals are generally part of *\*foundation trusts*, deriving their income largely from contracts with *\*clinical commissioning groups*. There are also around 400 private hospitals in the UK, which operate outside of the NHS, though some are contracted to provide some NHS services.

**Hospital Episode Statistics (HES)** (in England) a database containing data on all admissions to NHS hospitals and admissions of NHS patients treated elsewhere. *See* [RECORD LINKAGE](#).

**hospital fatality rate** *see* [CASE FATALITY RATE](#).

**hospital infection** *see* [NOSOCOMIAL INFECTION](#).

**hospital social worker** a social worker employed to assist hospital patients with social problems that may arise through illness. *See also* [SOCIAL SERVICES](#).

**host** *n.* an animal or plant in or upon which a *\*parasite* lives. An **intermediate host** is one in which the parasite passes its larval or asexual stages; a **definitive host** is one in which the parasite develops to its sexual stage.

**Hounsfield unit** the numerical unit assigned electronically to each *\*pixel* in a computerized tomography (CT) image, according to its X-ray density. The fixed points on the scale are arbitrarily assigned as –1000 for air and 0 for water. The CT image is viewed in a ‘window’. The range of Hounsfield units

displayed (window width) and the centre point of the range of interest (window level) can be varied by the radiologist in order to observe specific tissues (*see* [WINDOWING](#)). The unit was named after Sir Godfrey Hounsfield (1919–2004), who developed CT scanning in the 1950s. Symbol: HU.

**hourglass stomach** a deformity of the stomach in which the ‘waist’ is constricted by fibrosis caused by a chronic peptic ulcer, producing an upper and a lower cavity separated by a narrow channel.

**House–Brackmann facial nerve grading system (House–Brackmann score, House–Brackmann scale, House–Brackmann facial weakness scale)** a six-point grading system for patients with *\*Bell’s palsy* or other forms of facial nerve palsy. Grade I is normal function; grade VI is a total palsy. [J. W. House and D. E. Brackmann (21st century), US otorhinolarygologists]

**house-dust mite** *see* [DERMATOPHAGOIDES](#).

**housemaid’s knee (prepatellar bursitis)** inflammation and resultant swelling of the bursa in front of the kneecap, usually due to repetitive friction and pressure over the kneecap, as from frequent episodes of prolonged kneeling. Treatment includes pressure bandaging, *\*NSAIDs*, and avoidance of kneeling. *See* [BURSITIS](#).

**HPV** *see* [HUMAN PAPILLOMAVIRUS](#).

**HRT** *see* [HORMONE REPLACEMENT THERAPY](#).

**HSE** *see* [HEALTH AND SAFETY EXECUTIVE](#).

**5HT** 5-hydroxytryptamine (*see* [SEROTONIN](#)).

**5HT<sub>1</sub> agonist (triptan)** any one of a class of drugs that stimulate *\*serotonin* (5-hydroxytryptamine) receptors and are effective in the relief of *\*migraine* headaches by causing constriction of cerebral blood vessels. The group includes **almotriptan**, **naratriptan**, *\*sumatriptan*, and **zolmitriptan**.

**HTLV** human T-cell leukaemia/lymphoma virus (or lymphocytotropic virus) – a family of viruses that includes HTLV-I, which causes lymphoma. *\*HIV*

(the AIDS virus) was formerly called HTLV-III.

**HU** *see* **HOUNSFIELD UNIT**.

**Hudson–Stähli line** a linear horizontal yellowish line seen in the deep epithelium of ageing corneas. [A. C. Hudson (1875–1962), British ophthalmologist; J. Stähli (20th century), Swiss ophthalmologist]

**Hughes syndrome** *see* **ANTIPHOSPHOLIPID ANTIBODY SYNDROME**. [G. Hughes (21st century), British physician]

**human chorionic gonadotrophin (hCG)** a hormone, similar to the pituitary **\*gonadotrophins**, that is produced by the placenta during pregnancy. hCG maintains the secretion of **\*progesterone** by the corpus luteum of the ovary, the secretion of pituitary gonadotrophins being blocked during pregnancy. Large amounts are excreted in the urine, and this is used as the basis for most **\*pregnancy tests**. Serum hCG monitoring is used for tracking early pregnancy and detecting **\*ectopic pregnancies** (in which the level will not double over a 48-hour period, as it does with normal pregnancies). The level of hCG in the serum is also one of the indicators used in **\*prenatal screening** tests: levels are higher in pregnancies affected by Down's syndrome in comparison with normal pregnancies (*see also* **PAPP-A**; **TRIPLE TEST**). Levels of hCG are very high in **\*gestational trophoblastic neoplasia**. Some malignant tumours (e.g. malignant teratoma, choriocarcinoma, endodermal sinus tumour) secrete hCG, which can be used as a **\*tumour marker**. A preparation of hCG is given by injection to treat fertility problems due to ovulation disorders and to induce **\*superovulation** in in vitro fertilization.

**human chorionic somatomammotrophin** *see* **HUMAN PLACENTAL LACTOGEN**.

**Human Fertilisation and Embryology Acts** Acts of the UK parliament in 1990 and 2008, establishing and amending principles for the legal supervision, by the **Human Fertilisation and Embryology Authority**, of the creation, use, and storage of human embryos outside the body and of their use in treatment and research. The 2008 amendments included a ban on sex selection for social reasons, recognition of same-sex couples as potential legal parents, and regulations related to developing areas of research using embryos. The 1990 Act had also reduced the legal time limit for most

abortions from 28 weeks gestation (as in the 1967 Abortion Act) to 24 weeks. Interpretation and regulation of principles and practice in this rapidly developing area of research and practice continue and are often controversial.

<https://www.hfea.gov.uk/>

- Website of the Human Fertilisation and Embryology Authority: provides further information and guidance for patients, professionals, donors, and donor-conceived people

**Human Genome Project** a massive international research project to isolate all the genes in human DNA and determine the sequence of genes on human chromosomes. The project began in 1988 and the full draft sequence was published in 2001; the high-quality sequence was completed in 2003. The human genome comprises some  $3 \times 10^9$  nucleotide base pairs (*see* [DNA](#)) forming 22,000–25,000 genes, distributed among 23 pairs of chromosomes. Knowledge of the entire human genome has already resulted in the identification of the genes associated with many hereditary disorders and revealed the existence of a genetic basis or component for many other diseases not previously known to have one. Theoretically, this would enable the development of targeted drugs and the large-scale genetic screening of populations. *See* [PHARMACOGENOMICS](#); [TARGETED AGENT](#).

**human immunodeficiency virus** *see* [HIV](#).

**humanity** *n.* **1.** the state or quality of being human. In most ethical traditions, membership of the human species is seen as conferring a unique moral status, so that human life is considered inherently and particularly valuable and worthy of protection (*see* [SANCTITY OF LIFE](#)). Humanity may be defined in terms of a unique capacity to feel, reason, evoke emotional responses, or form relationships (*see* [PERSONHOOD](#)). **2.** compassion or benevolence.

**human leucocyte antigen system** *see* [HLA SYSTEM](#).

**human menopausal gonadotrophins** commercially available preparations of \*[follicle-stimulating hormone](#) and \*[luteinizing hormone](#). They are used mainly to treat infertility in women with gonadotrophin deficiency due to

hypopituitarism and to stimulate superovulation in women undergoing in vitro fertilization.

**human papillomavirus (HPV)** a virus – a member of the \*papovavirus group – that causes warts, including genital warts. There are over 100 strains of HPV: certain strains are considered to be causative factors in the development of anal and genital cancers, especially cervical cancer, but additional factors are necessary before the cells become malignant. HPV has also been implicated in oral dysplasia and some squamous cell carcinomas of the head and neck. It is one of the most common sexually transmitted infections. In women the presence of HPV may be detected on colposcopic examination, although techniques using DNA amplification (see **POLYMERASE CHAIN REACTION**) give more accurate results and suggest that up to 40% of a normal, apparently healthy, female population may harbour these viruses. In women with an abnormal cervical smear, the DNA test is found to be positive in a much higher percentage and is therefore a useful indicator of a high risk of developing cancer of the cervix. The **HPV vaccine** provides protection against strains of HPV associated with cervical cancer and other precancerous conditions (Cervavix, Gardasil) and against genital warts (Gardasil).

**human placental lactogen (human chorionic somatomammotrophin)** a protein hormone of 190 amino acids produced by the placenta during most but not all pregnancies. Despite its name it does not appear to have a role in lactation and its exact function remains obscure. It does, however, seem to contribute to the development of diabetes in some pregnancies.

**human rights** a legal framework adopted by the United Nations following World War II that sought to define and promote fundamental entitlements, conditions, and freedoms to be afforded to all human beings. In the UK the Human Rights Act 1998 enacts the provisions of the 1950 European Convention on Human Rights, which sets out, via fourteen articles, an individual's rights, entitlements, and freedoms.

**Human Tissue Authority** the UK government agency, established by the Human Tissue Act 2004, that regulates the removal, use, and storage of human organs and tissue from both the living and the deceased for certain purposes as defined by the statute. These purposes include clinical research, clinical audit, and medical education. Anyone handling such material for

those purposes should have a licence issued by the authority. Membership of the authority comprises clinical, scientific, academic, and lay representatives.

- Website of the Human Tissue Authority

**humectant** **1.** *n.* a substance that is used for moistening. **2.** *adj.* causing moistening.

**humerus** *n.* the bone of the upper arm (see illustration). The **head** of the humerus articulates with the **\*scapula** at the shoulder joint. At the lower end of the shaft the **trochlea** articulates with the **\*ulna** and part of the radius. The radius also articulates with a rounded protuberance (the **capitulum**) close to the trochlea. Depressions (**fossae**) at the front and back of the humerus accommodate the ulna and radius, respectively, when the arm is flexed or straightened.

**The humerus (posterior surface).**

**humoral** *adj.* circulating in the bloodstream; humoral **\*immunity** requires circulating antibodies.

**humour** *n.* a body fluid. *See* **AQUEOUS HUMOUR**; **VITREOUS HUMOUR**.

**hunchback deformity** *see* **KYPHOS**.

**Hunner's ulcer** *see* **INTERSTITIAL CYSTITIS**. [G. L. Hunner (1868–1957), US urologist]

**Hunter's syndrome** a hereditary disorder caused by deficiency of an enzyme that results in the accumulation of protein–carbohydrate complexes and fats in the cells of the body (*see* **MUCOPOLYSACCHARIDOSIS**). This leads to learning disability, enlargement of the liver and spleen, and prominent coarse facial features (**gargoylism**). The disease is **\*sex-linked**, being restricted to males, although females can be **\*carriers**. Medical name: **mucopolysaccharidosis type II**. [C. H. Hunter (1872–1955), US physician]

**Huntington's disease (Huntington's chorea)** a hereditary disease caused by a defect in a single gene that is inherited as an autosomal **\*dominant** characteristic, therefore tending to appear in half of the children of the parents with this condition. Symptoms, which begin to appear in early middle age, include unsteady gait and jerky involuntary movements (*see* **CHOREA**), accompanied later by behavioural changes, and progressive dementia. There is a defect in the Huntington gene on chromosome 4; **\*genetic screening** is possible for those at risk. [G. Huntington (1850–1916), US physician]

**Hurler's syndrome** a hereditary disorder caused by deficiency of an enzyme that results in the accumulation of protein–carbohydrate complexes and fats in the cells of the body (*see* **MUCOPOLYSACCHARIDOSIS**). This leads to severe learning disabilities, enlargement of the liver and spleen, heart defects, deformities of the bones, and coarsening and thickening of facial features (**gargoylism**). A bone marrow transplant offers the only hope of treatment. Medical name: **mucopolysaccharidosis type I**. [G. Hurler (1889–1965), Austrian paediatrician]

**Hürthle cell tumour** a malignant tumour of the thyroid gland that arises from **Hürthle** (or **Askanazy**) cells, altered follicular cells of the gland that have large nuclei and stain deeply with eosin (these cells are also found in benign

nodules and Hashimoto's disease). Hürthle cell carcinoma is not as common as papillary, follicular, or anaplastic thyroid carcinomas (see [THYROID CANCER](#)). [K. W. Hürthle (1860–1945), German histologist]

**Hutchinson's teeth** narrowed and notched permanent incisor teeth: a sign of congenital [\\*syphilis](#). [J. Hutchinson (1828–1913), British surgeon]

**hyal- (hyalo-)** *combining form denoting* **1.** glassy; transparent. **2.** hyalin. **3.** the vitreous humour of the eye.

**hyalin** *n.* a clear glassy material produced as the result of degeneration in certain tissues, particularly connective tissue and epithelial cells.

**hyaline cartilage** the most common type of [\\*cartilage](#): a bluish-white elastic material with a matrix of chondroitin sulphate in which fine collagen fibrils are embedded.

**hyaline membrane disease** see [RESPIRATORY DISTRESS SYNDROME](#).

**hyalitis** *n.* inflammation of the [\\*vitreous humour](#) of the eye. See also [ASTEROID HYALOSIS](#).

**hyaloid artery** a fetal artery lying in the [\\*hyaloid canal](#) of the eye and supplying the lens.

**hyaloid canal** a channel within the vitreous humour of the [\\*eye](#). It extends from the centre of the optic disc, where it communicates with the lymph spaces of the optic nerve, to the posterior wall of the lens.

**hyaloid membrane** the transparent membrane that surrounds the [\\*vitreous humour](#) of the eye, separating it from the retina.

**hyaluronic acid** an acid [\\*mucopolysaccharide](#) that acts as the binding and protective agent of the ground substance of connective tissue. It is also present in the synovial fluid around joints and in the vitreous and aqueous humours of the eye.

**hyaluronidase** *n.* an enzyme that depolymerizes [\\*hyaluronic acid](#) and therefore increases the permeability of connective tissue. Hyaluronidase is found in the testes, in semen, and in other tissues.

**hybrid** *n.* the offspring of a cross between two genetically unlike individuals. A hybrid, whose parents are usually of different species or varieties, is often sterile.

**hybridomas** *pl. n.* cells created by fusion of activated lymphocytes with malignant cells. The resulting hybrid cells are cloned and produce antibodies or T-cell receptors, identical to those produced by the parent immune cells. See **MONOCLONAL ANTIBODY**.

**HYCOSY (hysterosalpingo-contrast sonography)** an out-patient technique that tests for blocked Fallopian tubes. Using **\*transvaginal ultrasonography** following the injection of an echo contrast medium through the cervix, flow along the tubes can be reliably visualized. See also **DOPPLER ULTRASOUND**.

**hydatid** *n.* a bladder-like cyst formed in various human tissues following the growth of the larval stage of an **\*Echinococcus** tapeworm. *E. granulosus* produces a single large fluid-filled cyst, called **unilocular hydatid**, which gives rise internally to smaller daughter cysts. The entire hydatid is bound by a fibrous capsule. *E. multilocularis* forms aggregates of many smaller cysts with a jelly-like matrix, called an **alveolar hydatid**, and enlarges by budding off external daughter cysts. Alveolar hydatids are not delimited by fibrous capsules and produce malignant tumours, which invade and destroy human tissues. See also **HYDATID DISEASE**.

**hydatid disease (hydatidosis, echinococcosis, echinococcosis)** a condition resulting from the presence in the liver, lungs, or brain of **\*hydatid** cysts. The cysts of *Echinococcus multilocularis* form malignant tumours; those of *E. granulosus* exert pressure as they grow and thereby damage surrounding tissues. The presence of hydatids in the brain may result in blindness and epilepsy, and the rupture of any cyst can cause severe allergic reactions including fever and **\*urticaria**. Treatment may necessitate surgical removal of the cysts. Spread of hydatid disease, particularly common in sheep-raising countries, can be prevented by the deworming of dogs.

**hydatidiform mole** a collection of fluid-filled sacs that develop when the membrane (chorion) surrounding the embryo degenerates in early pregnancy with proliferation of the **\*trophoblast**. These sacs give the placenta the

appearance of a bunch of grapes and a characteristic snowstorm appearance on ultrasound. The levels of hCG are abnormally high. Hydatidiform mole can be subdivided into complete and partial mole based on genetic and histological features. Complete moles show no evidence of fetal tissue; there is usually evidence of a fetus or fetal red blood cells with a partial mole. The widespread use of ultrasound has led to earlier diagnosis and has changed the pattern of molar pregnancy. The majority of women present with symptoms of early pregnancy failure. See [GESTATIONAL TROPHOBLASTIC DISEASE](#).

**hydatidosis** *n.* see [HYDATID DISEASE](#).

**hydr- (hydro-)** *combining form denoting* water or a watery fluid.

**hydraemia** *n.* the presence in the blood of more than the normal proportion of water.

**hydralazine** *n.* a [\\*vasodilator](#) drug used, usually in conjunction with [\\*diuretics](#), to treat hypertension. Side-effects, including rapid heart rate, headache, faintness, and digestive upsets, can occur, especially at high doses.

**hydramnios** *n.* see [POLYHYDRAMNIOS](#).

**hydrargyria** *n.* see [MERCURIALISM](#).

**hydrarthrosis** *n.* swelling at a joint caused by excessive synovial fluid. The condition usually involves the knees and may be recurrent. Often no cause is apparent; in some cases rheumatoid arthritis develops later. Excess synovial fluid may also occur with other forms of inflammatory arthritis, such as psoriatic and reactive arthritis, as well as with osteoarthritis.

**hydrocalycosis** *n.* see [CALIECTASIS](#).

**hydrocele** *n.* the accumulation of watery liquid in a sac, usually the sac surrounding the testes. This condition is characterized by painless enlargement of the scrotum; it is treated surgically, by drainage of the fluid or removal of the sac.

**hydrocephalus** *n.* an abnormal increase in the amount of cerebrospinal fluid within the ventricles of the brain. In childhood, before the sutures of the skull have fused, hydrocephalus makes the head enlarge. In adults, because of the

unyielding nature of the skull, hydrocephalus raises the intracranial pressure with consequent drowsiness and vomiting. Hydrocephalus may be caused by obstruction to the outflow of cerebrospinal fluid (CSF) from the ventricles (**obstructive hydrocephalus**), a failure of its reabsorption into the cerebral sinuses, or increased production of CSF (**communicating hydrocephalus**). \***Spina bifida** may be associated with hydrocephalus in childhood. Treatment involves treating the underlying cause and, if necessary, diverting the excess cerebrospinal fluid into the abdominal cavity, where it is absorbed. This is achieved by tunnelling a thin tube from the ventricles to the abdomen (**ventriculo-peritoneal shunt**) or to the atrium of the heart (**ventriculo-atrial shunt**).

**hydrochloric acid** a strong acid present, in a very dilute form, in gastric juice. The secretion of excess hydrochloric acid by the stomach results in the condition \***hyperchlorhydria**.

**hydrochlorothiazide** *n.* a thiazide \***diuretic** used in combination with other drugs (e.g. \***amiloride**) to treat fluid retention (oedema) and high blood pressure.

**hydrocortisone** *n.* a pharmaceutical preparation of the steroid hormone \***cortisol**. Hydrocortisone is used in the treatment of adrenal failure (\***Addison's disease**), shock, and inflammatory, allergic, and rheumatic conditions (including rheumatoid arthritis, colitis, and eczema). Possible side-effects include peptic ulcers, bone and muscle damage, suppression of growth in children, and the signs of \***Cushing's syndrome**.

**hydrocyanic acid (prussic acid)** an intensely poisonous volatile acid that can cause death within a minute if inhaled. It has a smell of bitter almonds. *See* **CYANIDE**.

**hydrogenase** *n.* an enzyme that catalyses the addition of hydrogen to a compound in reduction reactions.

**hydrogen bond** a weak electrostatic bond formed by linking a hydrogen atom between two electronegative atoms (e.g. nitrogen or oxygen). The large number of hydrogen bonds in proteins and nucleic acids are responsible for maintaining the stable molecular structure of these compounds.

**hydrogen peroxide** an oxidizing agent used as a skin disinfectant for cleansing wounds and treating superficial bacterial infections. Diluted hydrogen peroxide solution is used as a deodorant mouthwash for treating oral infections (e.g. ulcerative gingivitis). Strong solutions irritate the skin.

**hydrolase** *n.* an enzyme that catalyses the hydrolysis of compounds. Examples are the *\*peptidases*.

**hydroma** *n.* *see* **HYGROMA**.

**hydronephrosis** *n.* distension and dilatation of the pelvis of the kidney. This is due to an obstruction to the free flow of urine from the kidney. An obstruction at or below the neck of the bladder will result in hydronephrosis of both kidneys. The term **primary pelvic hydronephrosis** is used when the obstruction, usually functional, is at the junction of the renal pelvis and ureter. Surgical relief by *\*pyeloplasty* is advisable to avoid the back pressure atrophy of the kidney and the complications of infection and stone formation. —**hydronephrotic** *adj.*

**hydropericarditis** *n.* *see* **HYDROPERICARDIUM**.

**hydropericardium** *n.* accumulation of a clear serous fluid within the membranous sac surrounding the heart. It occurs in many cases of *\*pericarditis* (**hydropericarditis**). If the heart is compressed the fluid is withdrawn (aspirated) via a needle inserted into the pericardial sac through the chest wall (**pericardiocentesis**). *See also* **HYDROPNEUMOPERICARDIUM**.

**hydroperitoneum** *n.* *see* **ASCITES**.

**hydrophobia** *n.* *see* **RABIES**.

**hydrophthalmos** *n.* *see* **BUPHTHALMOS**.

**hydropneumopericardium** *n.* the presence of air and clear fluid within the pericardial sac around the heart, which is most commonly due to entry of air during pericardiocentesis (*see* **HYDROPERICARDIUM**). The presence of air does not affect the management of the patient.

**hydropneumoperitoneum** *n.* the presence of fluid and gas in the peritoneal cavity. This may be due to the introduction of air through an instrument being used to remove the fluid; because of a perforation in the digestive tract that has allowed the escape of fluid and gas; or rarely because gas-forming bacteria are growing in the peritoneal fluid.

**hydropneumothorax** *n.* the presence of air and fluid in the pleural cavity. If the patient is shaken the fluid makes a splashing sound (called a **succussion splash**). An **\*effusion** of serous fluid commonly complicates a **\*pneumothorax**, and must be drained.

**hydrops** *n.* an abnormal accumulation of fluid in body tissues or cavities. For example, **corneal hydrops** is the sudden painful accumulation of fluid in the cornea seen in **\*keratoconus**. It results in a sudden reduction of vision. *See also* **HYDROPS FETALIS**; **MÉNIÈRE'S DISEASE**.
